MASTERS OF ACHIEVEMENT

THE WORLD'S GREATEST LEADERS IN LITERATURE, ART, RELIGION PHILOSOPHY, SCIENCE, POLITICS AND INDUSTRY

EDITED BY

HENRY W. RUOFF, M. A., D. C. L.

Author of "The Century Book of Facts," "The Capitals of the World,"
"Leaders of Men," "The Standard Dictionary of Facts," Etc.

PREFATORY

IN point of genuine human interest and educative value the life stories of individuals stand at the head of all literature. History is but an account of the connected achievements of individuals. Drama and fiction draw their fascination from the created individuals which people the realm of fancy. The great epics, the heroism, the romanticism of the ages, as well as the exploits of everyday life, center about the individual. Personality, in other words, is the supreme factor in human affairs, and is daily commanding more and more attention in the curriculum of modern life.

These facts naturally suggest the questions: Who are the great characters in the drama of the world development about whom we should know? Who are the great master minds that have contributed most to the development of civilized life and institutions? What have they accomplished? These questions the following pages make an intelligent attempt to answer, by placing before the general reader a carefully discriminated selection of concise, personal studies from the great mass of biographical literature of all ages and countries.

In carrying out this plan it has been thought best to divide the book into two parts, the first part being devoted to one hundred of the *greater* masters of achievement, and the second part to several thousand other persons, whose achievements entitle them to distinguished rank.

Unfortunately there is no absolute metric unit of greatness. Probably it is better so. But the consensus of judgment has singled out certain great individuals who the best informed minds now agree should be placed in the first rank among the greatest men of history. Such a list is the One Hundred included in this volume. Not only has the editor appealed to the judgment of past writers to justify his selection, but he has also been greatly assisted in the final determination of the list by over a hundred of the best contemporary authorities—educators, authors, jurists, journalists, publicists, and other specialists—who contributed individual lists giving the results of their best judgment in respect to each group of names finally included. This method has assured an authoritative selection by a board of personal advisors of the highest order.

The sketches themselves are necessarily mosaics—drawn from the most authoritative sources—and deal, in a measurable degree of completeness, with the lives, personal characteristics and achievements of those selected. They are accompanied, too, by numerous full page illustrations reproduced from the originals of great artists, and in the case of foreign names or those of unusual difficulty the phonetic pronunciation has been supplied. This unusual combination, it is believed, will make an especial appeal to a large body of discriminating readers.

The second part of the volume is not designed as an exhaustive dictionary of biography in the ordinary sense. It is rather a selected list of distinguished names each of which stands for some special achievement of note or field of endeavor. Differing judgments would probably add or subtract from the names here included, but on the whole it is doubtful whether the well informed mind would greatly change it.

A special debt of gratitude is due to many persons throughout the country for valuable assistance and suggestions—particularly to the body of distinguished educators and scholars who aided in the selection of names.

THE EDITOR.

866078

TABLE OF CONTENTS

ONE HUNDRED GREAT MASTERS OF ACHIEVEMENT

I. IN LITERATURE: Poets; Dramatists; Historians; Orators; Essayists; Novelists.

Homer — Æschylus — Sophocles — Herodotus — Demosthenes — Cicero — Vergil — Plutarch — Dante — Montaigne — Cervantes — Shakespeare — Milton — Molière — Montesquieu — Voltaire — Lessing — Gibbon — Goethe — Schiller — Scott —Wordsworth — Balzac — Carlyle — Hugo — Emerson — Browning, 9

II. IN FINE ARTS: Sculptors; Painters; Musicians; Architects.

Phidias — Leonardo da Vinci — Michaelangelo — Raphael — Titian — Rubens — Velasquez — Rembrandt — Bach — Handel — Mozart — Beethoven — Wagner, ... 121

III. IN RELIGION: Oriental Religions; Christianity.

Moses — Zoroaster — Confucius — Buddha — St. Paul — St. Augustine — Mohammed — Gregory VII.— St. Francis of Assisi — Luther — Loyola — Calvin — Wesley, ... 189

IV. IN PHILOSOPHY: Metaphysicians; Psychologists; Moralists; Educators; Logicians.

Socrates — Plato — Aristotle — St. Thomas Aquinas — Bacon — Descartes — Spinoza — Locke — Leibnitz — Hume — Kant — Hegel — Spencer, ... 254

V. IN SCIENCE AND DISCOVERY: Naturalists; Biologists; Physicists; Mathematicians; Chemists; Inventors; Discoverers.

Gutenberg — Columbus — Copernicus — Palissy — Galileo — Kepler — Harvey — Newton — Linnæus — Arkwright — Watt — Lavoisier — Cuvier — Stephenson — Morse — Darwin — Helmholtz — Kelvin, ... 324

VI. IN POLITICS: Military Leaders; Statesmen; Publicists.

Alexander the Great — Cæsar — Charlemagne — Alfred the Great — Charles V.— Grotius — Cromwell — Peter the Great — Franklin — Frederick the Great — Washington — Jefferson — Napoleon I.— Webster — Lincoln — Bismarck, . 419

FOUR THOUSAND OTHER MASTERS

From the Earliest Times Down to the Present, ... 519–1038

LIST OF ILLUSTRATIONS

IN FIRST PART

FACING PAGE
Homer, ... 9
Demosthenes Practicing Oratory, ... 19

KEY TO PRONUNCIATION OF NAMES

ä, as in farm, father; *ȧ*, as in ask, fast; *ă*, as in at, fat; *ā*, as in day, fate; *â*, as in care, fare; a (unmarked) represents the sound as neutral or obscure, as in final, infant. *ĕ*, as in met, set; *ē*, as in me, see; *ẽ*, as in her, ermine; e (unmarked) represents the sound as neutral or obscure, as in novel. *ĭ*, as in pin, ill; *ī*, as in pine, ice. *ŏ*, as in not, got; *ō*, as in note, old; *ô*, as in for, fought; *o͝o*, as in cook, look; *o͞o*, as in moon, spoon; o (unmarked) represents the sound as neutral or obscure, as in combine. *ŭ*, as in cup, duck; *ū*, as in use, amuse; *û*, as in fur, urge; u (unmarked) represents the sound as neutral or obscure, as in circus. TH, as in the, though.

FOREIGN SOUNDS

ö cannot be exactly represented in English. The English sound of u in *burn* and *burnt* is perhaps the nearest equivalent to *ö*. *ü* cannot be exactly represented in English. The English sound of u in *luke* and *duke* resembles the original sound of *ü*. N represents the nasal tone (as in French) of the preceding vowel, as in encore (*äN′-kōr′*). K represents ch as in German ich, ach.

NOTE.—The pronunciation of names included in the first part of the volume will be found in regular alphabetical order in the second part.

HOMER

From an Artist Portrait

LITERATURE

HOMER

> The poems of Homer do not constitute merely a great item of the splendid literature of Greece, but they have a separate position which none other can approach. They and the manners they describe constitute a world of their own — a scheme of human life and character complete in all its parts. We are introduced to man in every relation of which he is capable, in every one of his arts, devices, institutions, in the entire circle of his experience.— *Gladstone.*

HOMER, popularly referred to as the "father of song," will always remain the greatest and most typical name not only in ancient poetry, but in ancient art as a whole. His personal existence, his birthplace, and his era have proved fertile subjects of discussion among literary antiquaries. Some of these have maintained that the *Iliad* and the *Odyssey* — the chief poems attributed to Homer — are composed of a variety of legendary ballads, commemorative of incidents connected with the siege of Troy, which were the production of different authors, and were revised and skillfully interwoven during the age of Pisistratus; and that the name Homer was merely the impersonation of the genius of epic poetry. But the best of modern scholars are now agreed that we must hold *some* theory as to the nature of the personality hidden behind the poems which bear his name.

Seven cities at least claimed the honor of having given birth to the poet; and each of them seems to have had some tradition to allege in justification of its claim. The discrepancies of statement respecting the date of his existence are not less remarkable; for of the eight different epochs assigned to him the oldest differs from the most recent by a period of 460 years. According to the theory which carries with it the greatest probability, Homer flourished in 1100–1000 B. C., many years after the Trojan era.

He appears to have been an Asiatic Greek, and a native of Smyrna, an Ionian city on the coast of Asia Minor. From the circumstance of his having been brought forth on the banks of the Meles, a river which ran beside the city, he is said to have obtained the name Melisigenes. It is impossible, however, to come to any satisfactory conclusion on subjects concerning which history has given us such scanty materials. On one point all traditions agree, that he was afflicted with blindness; and his descriptions of external nature warrant the conclusion that this misfortune arose from accident or disease, and not from the operation of nature at his birth.

The writers of antiquity unanimously considered the *Iliad* and the *Odyssey* as the productions of a certain individual called Homer; and there is no evidence that the question of divided authorship was ever entertained by them. The literature and the poetry of that age were supplied in the Greek world, surrounding the Ægean sea, by a class of wandering minstrels who sang or recited from place to place the stories of bygone days. Some of the minstrels, no doubt, were poets of creative power; others adapted or repeated their lays. One of the favorite legends among them related to a great siege of the city of Troy, or Ilium, in Asia Minor, by a combined force of Greeks from every tribe. The motive of the war was well fitted to commend the story to the hospitable halls of the Greek chiefs. It was revenge for the abduction of a Greek chieftain's wife by a foreign guest — Helen, the wife of Menelaus, by Paris of Troy. After many adventures and prolonged delay the invaders took the city and burned it.

One incident in this story, which was sung in innumerable lays, was seized on by an imagination stronger than the rest, and was made the central thought and connecting link of a longer lay. It told of the wrath of Achilles, the chief hero of the Greeks, who, wronged by Agamemnon, another leader, withdrew for some time from the fight. It described the sufferings of the Greeks in the absence of the hero, and how, at length, he was induced, by indignation and grief at the loss of a fallen friend, to return to their assistance, and to stem the tide of defeat.

This story was the primitive *Iliad*, and forms the greater part of the present poem. The unity of the motive and the greatness of the poetry made the lay a favorite with the bards; but, as they recited it, they were tempted by local interests and by ambition to add fresh episodes celebrating other Greek chiefs, besides Achilles, and other tribes. In these additions, however, they maintained the spirit and the style of the greater bard, and very likely, in some cases, adopted other short poems. We may thus speak of the *Iliad* as the work of Homer in much the same sense in which we speak of the Parthenon marbles as the work of Phidias, though we cannot suppose that they were all executed by his own hand.

The other great poem which we attribute to the same name embodies another fragment of the legend of Troy. It relates the adventures of Odysseus — the hero of counsel among the Greeks at Troy, as Achilles was the hero of war — on his journey home from Troy to Ithaca. It describes the troubles suffered in his absence by his wife, Penelope, and his son, Telemachus, at the hands of a crowd of greedy and importunate suitors; the fortitude and constancy with which they resisted the attacks and the final triumph of the hero on his return, who appears at last as great in action as in counsel.

That this poem, the *Odyssey*, is the fruit of the same genius which planned the *Iliad* there is no evidence. The differences in general tone and in detail are many and striking; and they led even a school of Greek critics to attribute the two poems to different authors. If we are led to the same conclusion, we need not marvel that the youthful vigor of a poetic race, and the favoring conditions of an age of minstrelsy, produced at least two poets of surpassing merit. But we must note a similarity of language and subject sufficient to show that the poet of the original *Iliad* exercised a powerful influence over later as well as contemporary poets. His unique greatness lies in this, that he combined the strong human sympathy, the life-like action, and the picturesque language of early poetry, in their most perfect form, with the conception of a unity of structure and a progressive interest which belongs naturally to a later and literary age.

When we come to consider the *Iliad* and the *Odyssey* as a poetic whole, and to estimate their importance in the evolution, first, of the Greeks, and then of humanity as a whole, the question of the origin of the poems, and even of the personality of the poet, becomes comparatively insignificant. Both the poems, and especially the *Iliad*, were accepted from the first as the type of the highest order of poetry, the epic. It is from Homer that Aristotle draws his canons of epic poetry. An epic poem must constitute a united whole. This unity in the *Iliad* is what we recognize as the trait of the great original poet — that trait which impressed itself most on his contemporaries and reappears even more strongly marked in the later *Odyssey*. An epic poem, too, must develop a progressive interest. This interest we feel in the course of that primitive *Iliad*, free from inconsistent digressions, where reverses press harder and harder upon the Greeks until the death of Patroclus touches Achilles' personal feelings and brings him back to the Grecian host. And in the final catastrophe of the *Odyssey* we feel that progressive interest even more strongly developed as the recognition of the hero and the overthrow of his enemies are slowly and steadily prepared. The third mark of the epic which Aristotle demands — dignity of language and manner — belongs to Homer in an unapproachable degree, and gives a peculiar charm and force to almost every line of the two poems.

Besides these qualities, which belong to the *Iliad* and the *Odyssey* as a whole, the details in every part are marked by certain unique and consistent features. We are presented with a picture of every type of human character and every phase of human life possible in an early military society. All these are drawn not with a subtle psychological analysis, but in clear characteristic strokes, marking out types true to all time. And, though typical, few of Homer's characters are ideal, but purely human. We have bravery typified in many forms: commanding in Agamemnon; generous in Menelaus; high-spirited in Achilles. In Nestor we have the counsellor, wise in years; in Odysseus, the man of cunning word and scheme; Andromache is the tender wife, fearful of her husband's danger; Hector, the loving husband — loving honor more; Penelope, the matron and constant wife, faithful against time and importunity; Achilles, the devoted friend, tortured even at night by the loss of his companions. And in their subordinate spheres are warriors, children, slaves, clearly and truly drawn to life. Goethe finds in his two chief characters two great fundamental forms of human nature — Achilles the most brave, and Ulysses the most prudent of men. Achilles, indeed, is the grand pagan hero, the ideal of antiquity.

Homer is our greatest authority for what we know of the thought and life of primitive Greece. The main features of the society he describes, though in poetic language, are drawn from the facts around him. Here we see the patriarch become the priest and king of his tribe — the leader in battle and in council — the source and dispenser of justice. Such are the chiefs in the *Iliad*. In time of peace the chieftain lives in his ancestral house, and superintends his herds and lands. Art and commerce are almost entirely of foreign origin, due to Phœnician merchants. Literature is unknown.

The morality of Homer is indicated by the types of character which are held up to admiration — the brave warrior, the clever counsellor, the liberal host, the faithful friend, the constant wife; and by those which are held up to reprobation — the coward, the spiteful detractor, the greedy and arrogant man. No principles are appealed to; but the loyal observance of particular ties, and especially those of a relative or a friend, is recognized as a duty. Women — as heads of households — enjoy a high degree of freedom and respect.

But it is in his theology that Homer most perfectly sums up the thought of his age, and so revolutionizes the hierarchy of pagan deities as to influence most powerfully the thought of posterity. He supplants the older deities — earth, sun, sea, night — by the later and perfectly human types — Zeus, Hera, Apollo, Aphrodite, and Poseidon — in which the Greeks figured the deity. To these deities Homer gives the distinctive character and the position and function in the Pantheon which they retain throughout the Greek system. The gods become men and women of stronger passions and larger powers, but differing from men and women only in degree. And, although these supernatural beings take part in the action of the Homeric stories, and interfere with the course of natural events, their action and interference are so defined and limited that the story preserves its natural interest, and the men and women gain rather than lose by the presence of the superhuman.

After the Bible, no book has been so universally read as Homer's *Iliad*. It has been called the bible of heroes, and it was the bible of the ancient Greeks. Just as we read the Hebrew history to our children — much more from a moral than a historical attitude — and give to all the facts a didactic turn, so the old Greeks read Homer as a moral work, containing models of what they ought to be, exhibitions of punished vice and meanness, examples of fortitude, of temperance, of justice, and of wisdom.

Homer was the one common possession of all the Greeks. Their actual life was broken up by innumerable feuds and jealousies; in Homer, more than in any historical event — more even than in Marathon and Salamis — they had a meeting ground in the record of a united and disinterested action. It is the charter of Greek unity. It was studied by every Greek — known by heart, we are told, by many. The expositor of Greek theology appealed to Homer. The sceptic attacked the belief of Homer as the representative of the popular creed. The teacher of morality quoted his texts from Homer; and those who, like Plato, wished to purify and elevate the national morals, found in Homer the traditional standard.

Homer is a key to the Greek view of life and of the world. The human ideal of religion and morality which we find in him dominates their whole conception. The gods are greater men, perfect in those personal qualities which were prized as virtues — strength, beauty, and wisdom. As the old men in Troy adored the beauty of Helen in spite of the troubles she had brought upon them, so the Greeks found in beauty of every kind the seal of perfection, and connected ugliness with imperfection and vice, as Homer united them in Thersites. The ideal of art, connected intimately from the first with religion, is to make the perfect human form as an honor and an offering to the gods.

Not only in its general aim and spirit, but in every department and every detail of Greek art — and thence of Roman art — we find the influence of Homer. In sculpture and painting, the types of the gods were the types which Homer had created — the Zeus of Phidias was the Zeus of Homer. In the drama, tragedians found their subjects in the Homeric tale; the plays of Æschylus were "morsels from the feast of Homer," while the spirit of Greek tragedy breathes already in many Homeric scenes — the parting of Hector, the house of Priam after Hector's death, the ransoming of Hector's body. As the type of epic poetry, Homer gives inspiration, subject, and many details to Vergil; and through Vergil we trace the influence of Homer in the modern epic.

"In conception and portraiture of character," says William Mure, "and the deeper vein of tragic pathos, Homer may be equaled, if not surpassed, by Shakespeare; in moral dignity of thought and expression, by Milton; in the grace and delicacy of his lighter pictures, by Petrarch and Ariosto; and in the gloomy grandeur of his supernatural imagery, by Æschylus or Dante. But no one of these poets has combined, in a similar degree, those various elements of excellence in each of which they may separately claim to compete with him."

ÆSCHYLUS

Are Æschylus and Sophocles and Euripides dead? No; the wondrous three are still in constellation. Bright are they as when they first shone, thousands of years ago, in the heavenly sky. But which are they? In what quarter of the region hang their golden lamps? Yonder. You see the glorious gems, enclosing as in a triangle a deep blue portion of stainless ether. The apex-star is Æschylus — to the east is Sophocles — to the west, Euripides! — *John Wilson.*

ÆSCHYLUS was the greatest of the Greek dramatists, and one of the greatest dramatic writers of any age. He was also, fortunately, by far the most historic personage, and possessed the most vivid personality of all the poets of Greece. We know with considerable precision the main facts of his life; but we know his inmost spirit, his temper, and his aspirations as clearly as we know those of Dante and Milton. We recognize in him a genius of a profoundly religious depth, a character of Homeric power and heroism; a passionate opponent of the old theocratic tyranny, which sought to crush out the free life of the Greek republic, and a zealous defender of the civil and religious institutions of his country.

Æschylus, son of Euphorion, a Greek nobleman, was born in the year 525 B. C., in the district of Eleusis, in Attica, a few miles west from Athens, on the borders of Megara. In the neighborhood of the world-renowned sanctuary of Ceres, his youth was spent under the solemn religious influence which gave so decided a tone to his dramatic works. At the age of twenty-five, he exhibited his first tragedy; but did not gain his first dramatic prize until the year 484 B. C., when he was forty-one years of age. Meanwhile the soul of Greek nationality had been roused in all its strength by the invasion of the generals of Darius, ending in their disgraceful defeat at Marathon in 490 B. C. In this battle Æschylus fought; and the ardor of his patriotism was no less prominently manifested by the part which he took in the great naval engagement of Salamis, ten years afterward. He fought also with honor at Artemisium and Platæa; and it is, with the heroism of Cervantes at Lepanto, one of the rare occasions on which one of the great poets of the world took part in one of the decisive campaigns of history.

There can be no doubt that the lofty tone of his poetry is to be attributed in no small degree to the impulse which the whole Greek mind received from the great political movement that terminated in the complete overthrow of the insolent claims of the oriental autocrat Darius. But in Æschylus there is also distinctly visible a certain soldierly attitude, and a delight in the pomp and circumstance of war, that is clearly traceable to the atmosphere of Marathon and Salamis, which the poet had breathed.

The only other external event of any consequence in the life of the "father of tragedy" is his sojourn in Sicily, a country which King Hiero had about that time rendered an agreeable place of residence for poets and literary men. He returned to Athens in later years, and his great play, *Agamemnon*, was produced in 458 B. C., when the poet was sixty-seven. In the *Furies* he shows himself an ardent opponent of the dominant democratic party; and, apparently on political grounds, he again withdrew to Sicily, where he died at Gela in 456 B. C., aged sixty-nine. His epitaph, said to have been written or dictated by himself, ran thus: "Æschylus, son of Euphorion, an Athenian, lies beneath this stone. He died at fertile Gela. Marathon can tell of his tried manhood, and the Persian who there felt his mettle." Not a word about poetry.

Æschylus produced, it is said, seventy-eight plays, of which but seven remain, the Orestean trilogy of the *Agamemnon*, the *Libation-bearers*, and the *Furies*, being the sole extant trilogy, or series of three grouped dramas. It is permitted to hold the loss of these seventy-one tragedies to be the greatest which ancient literature has sustained. The fame of Æschylus, although at Athens it was placed second to that of Sophocles, as at Paris that of Corneille was dimmed by the fame of Racine, and for the same reasons, lasted long after his death.

His plays were often represented by his sons and others — an honor extremely rare and almost unique. He was rightly called the "father of tragedy." For, in adding a second actor to the original single actor, who recited a narrative to the chorus, Æschylus made true tragedy possible; and when, in imitation of Sophocles, he placed a third actor on the stage simultaneously with the chorus, the dramatic machinery as conceived in Greece was complete.

Before the time of Æschylus there was no real theater. Greek tragedy as he found it was simply a poem, recited or chanted by one speaker; it was declamation without action, scenery, or accessories of any kind. Æschylus introduced dialogue; invented the tragic boot, mask, and mantle; dressed the speakers in character; and turned the platform into a mimic representation of the place or scene where the event was supposed to occur.

What was the origin of the drama? Before there was such a thing in the world as "drama," there existed "chorus"; the drama grew out of the improvised recitations, given in the intervals of the Bacchic choruses sung at the great festivals. While the chorus rested, the leader chanted a long monologue in praise of Bacchus; this was the first stage of development. In a later age, a second person was brought upon the platform, who replied to the first, and this made "dialogue," and was the foundation of tragic art. Finally, another actor was added, and still others; the dialogue, which was at first but a recitative and an accessory, grew little by little till it usurped the principal place. In our day, it employs many actors, while the old chorus, which was once all in all, has dwindled away, the only vestige of it remaining in what is now called the orchestra. The greatest step in the gradual change was the transition from monologue to dialogue, and this took place in the time of Æschylus. Thus, this mighty genius may be said to have conceived full-grown, and to have created in its completeness, one of the grandest forms of human art.

The style and conception of Æschylus were in every way those of his character and life. He was uniformly heroic, earnest, profound, and martial. He called his dramas "scraps from the rich banquet of Homer." He carried to a fault sublimity of diction, originality of phrase, and tremendous intensity of dramatic situation. Cicero calls him a Pythagorean, meaning thereby his deep and pure spiritual earnestness. Æschylus was a stern and passionate supporter of the old aristocratic and conservative party, of the old ceremonies, and the ancient institutions of the city of Solon. He is a stout upholder of reverence for the gods, the pervading power of religion, the sanctity of oaths, the duties of hospitality, and the inviolability of marriage.

Intensely military, his dramas abound in terms of war; and in the *Persians* his patriotic enthusiasm rings forth like a trumpet. He is saturated with the idea of the revolt of the free commonwealths against the theocratic despotism of Asia. In the *Prometheus* he idealizes the revolt of man from the pressure of the priestly caste, and the martyrdom of those who led the way to his emancipation. But, if the *Prometheus* be the first poem of Æschylus, the *Agamemnon* must be counted as his first tragedy — perhaps, as pure tragedy the finest ever produced, in massive intensity, in unity of impression, and in statuesque sublimity of form.

It may be doubted if Dante or Shakespeare has surpassed Æschylus, or even equaled him, in the art of bringing before us ideal beings so imposing, so awful, and so vivid; or, in so completely transporting us into a world of a weird imagery, real and yet superhuman. The occasional monotony of his stately manner, the harshness of his compound epithets, and the not infrequent tendency to extravagance and even bombast are slight defects among such grand qualities.

Aristophanes painted the poet to the life, and did ample justice both to his unequaled greatness as a poet, and to his noble aim as a patriot and a teacher. For Æschylus was the great spiritual power of his age, the poetic voice of Greece in the one sublime epoch of her whole history. Aristophanes, in his inimitable comedy, the *Frogs*, has brought out the heroic temper of the man, the proud and stately self-will, the fiery imagination, the burning faith in high and pure ideals, the avalanche of great thoughts, even the torrent of superabundant imagery which the poet threw into his work.

Æschylus was more than poet. His inner purpose was that of Isaiah and Ezekiel, of Dante, and of Milton: the presentment of the great problem of human life, the sense of an overruling Providence, the moral greatness and force of the just man, the ruin and shame ultimately in store for the unjust, the inevitable retribution that awaits crime, the inheritance of evil, the grandeur of virtue, courage, purity, and good faith.

Aristotle's definition of tragedy was that it "purified the soul by pity and terror." Its duty was to rouse the spirit from all that is sordid, torpid, and mean, by touching the sympathies to the quick, by calling out the dormant feeling of interest in our fellow men, pain at their sufferings, and enthusiasm for their heroism; by rousing the self-contented nature, fattened with good things, to a consciousness of the tremendous issues for good or evil with which human life is surrounded. In this task it is doubtful if any Hebrew prophet, or mediæval preacher, has ever surpassed Æschylus.

SOPHOCLES

Sophocles shows at times one high power which but few of the world's poets share with him. He feels, as Wordsworth does, the majesty of order and well-being; sees the greatness of God, as it were, in the troubled things of life.— *Murray*.

SOPHOCLES, the second great dramatist of Athens, during his long life, witnessed the whole period of Athenian glory. He saw the Persian wars and the Peloponnesian wars, the whole career of Themistocles, Cimon, Pericles, and Nicias, the rise and perfection of all the arts of poetry and form, and all the great Athenians between Aristides and Plato.

Five years before Marathon, and fifteen before Salamis, Sophocles was born at Colonus, a beautiful village in the immediate vicinity of Athens, in 495 B. C. He was thus thirty years younger than Æschylus, and fifteen years older than Euripides. His father, Sophilus, a man of good family, and possessed of considerable wealth, gave him a liberal education in all the literary and personal accomplishments of his age; and these were still further enhanced by a person eminently handsome, which had been moulded and trained by the exercises of the palæstra. He was instructed in poetry and music by the famous Lamprus, and his proficiency is attested by the fact that, when his countrymen, after the battle of Salamis, assembled to celebrate the glorious victory which they had achieved, he, though a youth of fifteen, was selected to play an accompaniment on the lyre to the pæan, in which the chorus of youths sang their country's triumphs. It is, besides, probable that he also composed the words of the ode.

The commencement of his career as a dramatist took place under circumstances peculiarly interesting. Æschylus had for thirty years been the undoubted master of the Athenian stage, and was now to contest the palm with a youthful competitor of the age of twenty-seven, whose great accomplishments and personal graces had excited an unusual interest in his favor. The festival of the Dionysia, was, on this occasion, rendered still more imposing by the return of Cimon from the island of Scyros, bringing with him the bones of Theseus. Many people accordingly flocked to the theater of Bacchus. When Cimon and his nine colleagues entered the theater to offer the customary libations to the god, the chief archon, instead of choosing judges by lot, detained the ten generals at the altar; and, after administering to them the usual oath, constituted them the judges between the rival tragedians. Before this tribunal Sophocles exhibited his first tragedy, and by their award obtained the first prize. His subsequent career fully justified the decision of the judges.

From this epoch (468 B. C.) he maintained the supremacy until 441 B. C., when his formidable rival, Euripides, was preferred to him, and gained the first prize. For sixty-three years Sophocles continued to compose and exhibit. During that period he twenty times obtained the first prize, still more frequently the second, and never descended so low as the third — a degree of success which far exceeded that of his great rivals. In 440 B. C. he exhibited the *Antigone*, the earliest of his extant dramas, a play which gave such satisfaction to the Athenians that they appointed him as a colleague of Pericles and Thucydides in the war against Samos. He seems to have won no laurels in his military capacity. Several civic offices of honor and respectability, however, were conferred upon him in his old age. He was made priest of Halon, a native hero; and after the disastrous termination of the Syracusan expedition in 413 B. C., he was, in his eighty-third year, appointed one of the committee of public safety. In this capacity he consented to the appointment of the council of four hundred in 411 B. C.

The last years of his life were disturbed by family dissensions. In consequence of his partiality for a grandson, the eldest son endeavored to deprive him of the management of his property on the ground of incapacity and dotage. The only defense offered by the aged dramatist was to read in the presence of his judges a passage from the *Œdipus at Colonus* which he had just written; on hearing which the judges dismissed the case, and rebuked his son for his undutiful conduct. He died in his ninetieth year, just before the catastrophe of his country, having long been the model of Attic culture at its highest mark. He is famed for being the type of "sweetness and light," as conceived in the golden age of Athens, the man of "sweet temper," of consummate grace, and of uniform balance of mind. His private character seems to have been, on the whole, amiable; the blemishes attributed to it being those of the age rather than of the individual.

Sophocles marks the passage from the drama as a religious institution to the drama as a work of pure art. He made the great step in advance of adding a third speaker to the second of Æschylus; and this was evidently essential to the full development of the dramatic ideal. The plot and the elaborate evolution of character and situation in his plays are artistically a great advance upon the simple conception of Æschylus; and, in discarding the trilogy, he was able to make each drama a highly complex and refined study of character in action. Hence, by his contemporaries at Athens, and perhaps by the ancients, Sophocles was regarded as the perfection of the tragic poet.

The *Œdipus King* was taken by Aristotle as the type of true tragedy, and Professor Jebb calls it "in one sense, the masterpiece of Attic tragedy." As a work of consummate art, it is, perhaps, the most perfect tragedy extant. In the same way, all the plays of Sophocles which survive — *Œdipus King* (or *Œdipus Tyrannus*), *Œdipus at Colonus*, *Antigone*, *Philoctetes*, *Ajax*, and *Maidens of Trachis* — are examples of supreme skill in painting character, and in the combination of tragic situations. But the poet is no longer, as in the trilogy, hero, prophet, and preacher; he is simply the faultless artist.

The distinguishing trait of the compositions of Sophocles is their unrivaled harmony. The elements of his dramas, as dialogue and song, the expression of familiar sentiments or of violent passion, are so artistically graduated as to pass without shock from one extreme to the other, in a manner quite different from the rugged method of Æschylus. The latter may have been his rival in invention, and it is true that Shakespeare far excels him there. He does not, like Shakespeare, give a complete picture of life in its manifold phases, but takes a single idea, a typical character, and embodies in it all the essential elements of humanity. He makes tragic poetry a true mirror of the soul, and exhibits, as has seldom been done, the true moral significance of human action.

His later dramas, especially, are written in a most elegant style, with concise and vigorous dialogue, and rich poetical sentiment. He is the Phidias of dramatic art. He was, above all, an Athenian poet, as compared with Æschylus and Euripides, who were Hellenic, and he represented the genius of his well-loved city in its most perfect form.

His teaching is the doctrine of fate, as it was understood by the ancients, and of this he is the best exponent. "Fate," he says, "is a dread power. If thou be wealthy, thou wilt not buy her off; if thou be valiant, thou canst not withstand her; if thou shut thyself within a tower, she will find thee out; if thou cross the sea in ships, she will overtake thee on the way. Whoso contendeth against Fate, fighteth against fearful odds. Thou canst not shake off what load Fate shall have put on thy shoulders."

HERODOTUS

As the general father of prose composition, Herodotus is nearly related to all literature whatsoever, modern not less than ancient. . . . We hold that Herodotus furnishes by much the largest basis for vast commentaries revealing the archæologies of the human race; whilst, as the eldest of prose writers, he justifies his majestic station as a brotherly assessor on the same throne with Homer.— *De Quincey.*

HERODOTUS, the earliest of Greek historians, and by common consent called the "father of history," rendered the same services to history that Thales did to science. Before him there is no trace even of a chronicle of events other than that of the epic poets, between whom and the philosophic Thucydides he forms the only link.

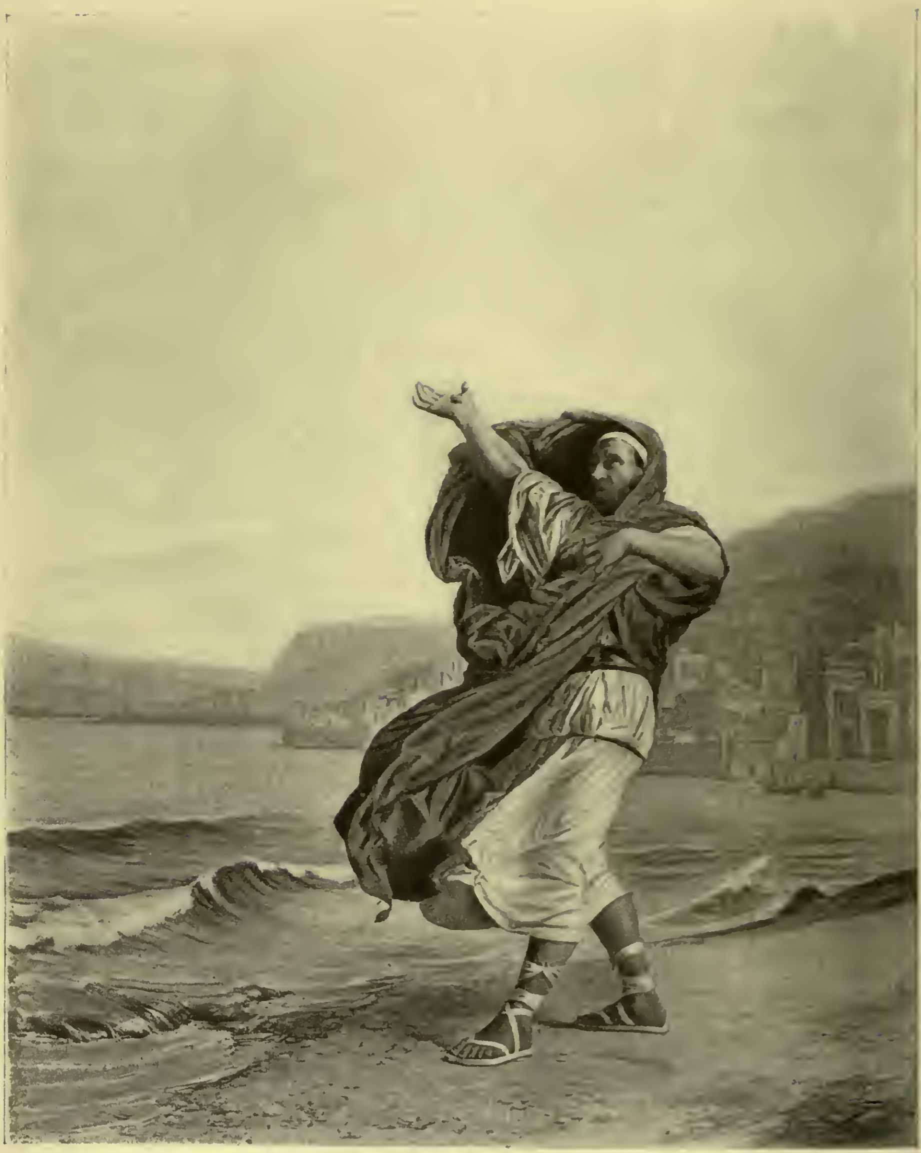
The accepted account of his life, gleaned largely from his own works, makes Herodotus a native of Halicarnassus, a Doric colony in Caria, Asia Minor, where he was born probably about 484 B. C. This province, at the time, was governed by Artemisia, a vassal queen of the great king of Persia. His father was named Lyxes; his mother, Dryo, was sister of Panyasis, one of the revivers of epic poetry, who was highly esteemed by the ancients. It is supposed that the poet superintended the education of his nephew, and inspired him with that love of the beautiful and the true, that desire to know and to see, which is the essential quality of a good historian. Probably Herodotus commenced in early life that series of visits to distant lands, in the course of which he amassed those precious materials that were afterward so artistically worked up in his immortal history. Nothing positive is recorded, however, of the studies which occupied his early years, or of the circumstances which favored the development of his genius.

When he was about thirty years of age a rebellion broke out at Halicarnassus. Panyasis was put to death by Lygadmis, grandson of Artemisia, and Herodotus was compelled to flee to Samos, which became his foster country. There he found devoted and powerful allies, who assisted him in freeing his compatriots from the yoke of Lygadmis; but after he had satisfied his vengeance, he experienced so many disappointments that he quitted Greece proper, and fixed his residence at Thurii, near the ancient Sybaris, in Lucania, Italy, where he continued to live until his death about 424 B. C. There, it is supposed, he wrote his history. Several ancient authors, indeed, call him "the Thurian," on account of his prolonged residence in that city.

The passion to know, to see, and to relate, appears to have taken possession of the mind of Herodotus in his youthful days. He betook himself early in life to travel, aware that a civic career was closed to him. He visited almost every city of Greece; he became familiar with every part of the coast of Asia Minor; he made a long stay in Egypt; and he reached even the distant Scythia. He penetrated to the extremity of the Pontus Euxinus, and sojourned for some time in every place which contained anything likely to gratify his insatiable curiosity. It is needless to say that if the great historian visited the countries of the East, the Greek cities of Asia, and the northern extremities of the Hellenic world, he did not neglect to make himself acquainted thoroughly, and in detail, with all the localities of European Greece — with the cities, temples, and battlefields of the continent and of the isles.

Tradition has it that on the conclusion of these voyages he placed in order the information he had acquired, and that when he had completed this great work he read it to the Greeks who were assembled for the Olympian games. It comprised the most remarkable occurrences within a period of 240 years, from the reign of Cyrus, the first king of Persia, to that of Xerxes, when the historian was living. His auditors were so charmed with the recital that they gave the name of one of the nine muses to each of the nine books into which his "History" is divided. It is added that Thucydides, then fifteen years of age, who was present at this reading, could not help shedding tears of admiration, and that Herodotus, noticing his tears, predicted for the young man a brilliant future.

Criticism has tried to prove this pretty story to be a mere invention; but another statement, which carries with it a greater appearance of truth, is that when thirty-eight years old Herodotus went to Athens on the occasion of the grand pan-Athenian festivals, and there read in public fragments of his work, still incomplete, but certain portions of which were already in the state in which they have been handed down to us. The audience received the work with enthusiastic applause, and awarded to the incomparable



DEMOSTHENES PRACTICING ORATORY

narrator a prize of ten talents, besides bestowing upon him by acclamation the title of "father of history."

Up to that period the narration of past events had been undertaken only by the logographers, or chroniclers, who merely described what had occurred in their own or in foreign countries, people by people, and town by town, without any connection. Herodotus made an immense advance in historical composition, by giving unity to a multitude of apparently disconnected occurrences which had taken place in Europe and in Asia, and which centered chiefly about the Persian invasion of Greece. The link connecting the whole he sought for and found, not like the more advanced of the chroniclers in the traditional series of genealogies, but in an idea — the idea, as profound as it is true, as dramatic as it is popular — of the old quarrel between the East and the West. He proposed to relate the causes and the course of the war between the Greeks and the barbarians. He wrote with the recollection of the glorious close of the struggle still fresh in men's minds, in that brief period when a feeling of security filled all Greece. The war itself, however, is only the goal to which he moves. As each nation appears on the scene, the current of his story stops, that he may pour out his full knowledge concerning it: not merely chronicling the vicissitudes of its dynasties, but with a true instinct dwelling in curious detail on its religion, superstitions, and habits.

Herodotus raised prose narrative to the height of poetry. Ancients and moderns have alike been struck, in various points of view, by the analogy between the work of Homer and that of the "father of history." Homer sang; Herodotus wrote; but both were animated with the same inspiration, with the same thought, at once national and poetic, for they both addressed themselves to Greece in order to glorify her in the past, to delight and to instruct her people.

The veracity of Herodotus has been sometimes questioned, even by the ancients, but the researches of modern travelers, and the discoveries of science, show that his detractors were not infrequently in the wrong.

As to his style, the ablest critics of antiquity proclaimed it perfection, not because it is entirely free from irregularities of construction, but because the phraseology is always simple, clear, harmonious, and brilliant, displaying all those qualities which are most calculated to captivate the mind. The author used the Ionian dialect in the composition of his "History."

That which charms the readers of Herodotus is that child-like simplicity of heart which is ever the companion of an incorruptible love of truth, and that happy and winning style which is found only where manners are true to nature. While other pleasing discourses of men roll along like torrents, and noisily hurry through their short existence, the silver stream of his words flows on without concern, sure of its immortal source, everywhere pure and transparent, whether it be shallow or deep. The fear of ridicule, which too often sways the whole world, never affected the sublime simplicity of his mind. To him, as to Æschylus, all experience declared, in the life of nations as in the life of individuals, the presence of a power dispensing rigorous justice. Thus there was dimly recognized a continuity in human events at the very threshold of written history.

DEMOSTHENES

His manner is rapid harmony adjusted to the sense; it is vehement reasoning without any appearance of art; it is disdain, anger, boldness, freedom, involved in a continued stream of argument; and of all human productions, the orations of Demosthenes present to us the models which approach the nearest to perfection.— *Hume*.

DEMOSTHENES, the greatest of the Greek orators, has had no successful rival in eloquence, either ancient or modern. Though his voice is stilled, the majesty and beauty of his diction are not hidden from us even by a dead language, while his dialectical skill, his persuasiveness, his invective, and, above all, the lofty ethical character of his appeals lose nothing by translation.

Demosthenes was born at Pæania, Attica, about the year 385 B. C., the son of a cutler and cabinet-maker and an Athenian citizen. Having lost his father at the age of seven, the care of his youth, as well as the management of his property, amounting to fifteen talents, devolved upon three guardians appointed by his father. At the end of his minority he commenced a prosecution against his guardians to recover his property, which they had squandered, and, after a litigation of two years, obtained a verdict against one of them, who was condemned to pay a fine of ten talents. The prosecution was conducted by himself; and the speeches which he delivered in support of his cause excited the admiration and applause of the judges.

Encouraged by this successful beginning, he ventured to speak before the people, but his feeble and stammering voice, his interrupted respiration, his ungraceful gestures, and his ill-arranged periods brought upon him general ridicule. His failure, however, only roused the energies of his unconquerable will; he resolved to correct the deficiencies of his youth, and overcame them with a zeal and perseverance which have passed into a proverb. After a course of the most rigorous discipline, he reappeared in public, 355 B. C., and pronounced two orations against Leptines and Androtion, the former of which is considered one of his greatest efforts. His fame as an orator now secured for him general esteem, and entitled him, as one of the leading statesmen of Athens, to take an active part in all public affairs. Henceforth his career was that of an Athenian statesman seeking to compel an almost impossible Greek unity.

Like Hannibal and many another admirable champion of conquered causes, Demosthenes devoted splendid talents and a grand character to resisting a destiny which, as we can now see, it would have been wise to accept. Himself animated by a generous pan-Hellenic patriotism, he could not endure to learn the bitter lesson that the vices and defects of Greek politics were incurable, and that, though the advantages of Macedonian leadership might be marred and nullified by irreconcilable hostility, the thing itself, in better or worse form, could not be escaped. Accordingly, from the moment when Philip began to interfere in Greece, he found a vigilant and unwearied opponent in Demosthenes.

The Athenians of that day, though coveting empire as much as ever, were not as ready for personal sacrifice as in the time of Pericles. Their armies were oftener composed of mercenaries than of citizens, and the funds which should have equipped fleets were lavished on the religious festivals and artistic displays so dear to that cultivated populace. Demosthenes, at much risk not only of unpopularity but of punishment, strove, and not without some success, to reform these abuses and to inspire his countrymen with the ardor and energy of other days. But the reforms and the martial revival came too late. In another direction he labored to compose the fatal feuds between the leading Greek states, and to transform their inveterate jealousies into a noble emulation for the defense of their common independence, threatened by Macedon. The crowning triumph of the patriot orator was when he confronted the ambassadors of Philip at Thebes, and by his glorious eloquence prevailed on the old enemies of his city to forget their grudge and join with Athens in striking a last blow for the liberties of Greece.

Side by side stood the citizen soldiers of Athens and Thebes on the fatal field of Chæronea, and together they went down before the trained battalions of Macedon, the genius of Philip, and the fiery valor of the youthful Alexander. The "sacred band" of Thebes, the old companions of Epaminondas, died to a man, and one thousand Athenians lay beside them. But Demosthenes, who had himself served in the ranks of that terrible day, could proudly aver that he would never repent of the resolve which had saved the honor of his beloved city though all else were lost.

The battle of Chæronea left Philip of Macedon master of the destinies of Greece; and the enemies of Demosthenes seized the opportunity of assailing him by every form the laws allowed, and he was daily harassed by their opposition. To test the strength of public feeling, Ctesiphon, a political friend, introduced into the Athenian assembly a resolution to confer a golden crown on Demosthenes as a suitable acknowledgment of his public services. Before the proposition became a law, any citizen might prosecute the author of it by an indictment for illegal propositions. Æschines accordingly prosecuted Ctesiphon. The trial was finally held in 330 B. C., after a postponement of eight years. Demosthenes appeared in the formal character of counsel for Ctesiphon, but in reality in his own defense. The orations delivered by the rival statesmen are considered their masterpieces; but Demosthenes far surpassed Æschines, and was decreed the golden crown.

On the accession of Alexander, 336 B. C., Demosthenes still cherished the same feelings toward the Macedonians; but the sudden appearance of the youthful conqueror overawed opposition. Even his great services could not protect him against an outburst of popular feeling. Harpalus, one of Alexander's generals whom he had left at Babylon, absconded with the treasure intrusted to his care, and, arriving in Athens, purchased the protection of the city by distributing his gold among the popular leaders. Demosthenes was one of the suspected recipients; and, being declared guilty, and fined fifty talents, he retired to Ægina and Trozene, where he remained until the death of Alexander, 323 B. C.

On the death of Alexander, Demosthenes again endeavored to rouse the Greeks against Macedon. But the insurrection was soon suppressed. Returning to Athens for a short time, he was forced again to withdraw in 322 B. C.; and, returning to Calauria, a small island opposite Trozene, he took refuge in the temple of Neptune. Here the orator took poison that he might not fall into the hands of the victors. He was sixty-three when he died.

After the verdict of centuries, opinions differ little as to the position which Demosthenes occupies. His name is a synonym for eloquence. His style, less terse than that of Thucydides, surpassed in subtility by that of the dialogues of Plato, was better adapted than either to impress a popular assembly. He was not less remarkable for the skill with which he ordered his arguments, the telling humor and vivacity which gave them point, than for the majesty of his more impassioned appeals. Cicero, Quintilian, Longinus — all the best critics of the ancient world — combine with the foremost poets and orators of modern times to hold him forth as an almost faultless example of excellence. If we consider the total amount and compass of his speeches, we are at a loss whether to wonder more at the industry which made him master of so wide a range of subjects, or the genius which inspired his handling of them all.

As a Greek statesman he is second only to Pericles and Epaminondas, who united to equal constancy and sagacity still greater powers of action; and when we place him after these, we must recollect the happier times in which they lived.

In contemplating from a distance the game of history, we are wont to exaggerate the merit of the players who win, and underestimate the greatness of those who lose. Success is elevated above the virtues; and failure degraded below the crimes. The unfairness of this view has never been so well exposed as by Demosthenes himself in his own immortal defense. The events of the first part of the struggle justified his boast, that wherever his advice prevailed his country's ruin was averted. He might well confess that he was responsible only for that over which he had control; he had no control over fortune, or the follies of his age. He did what he could to enlighten it; and even if we assume that the great results of history are for the best, and that Greece had reached the natural term of her power, we must remember that the efforts of the brave men who fail, have yet their influence on those great results, and, if undertaken from high motives, their place among the agencies for good.

The great orator shared perhaps too largely in that infirmity which last besets noble minds, but his policy seems to have been dictated throughout by the purest patriotism. It is in view of his constancy, his devotedness, and the single eye with which he pursued the great purpose of his life, that Niebuhr has called him a saint. He was a hero in no contracted sense, and none the less a martyr, that he died faithful to a cause which had become hopeless.

Demosthenes inherited a delicate constitution, but he overcame this weakness by the most rigid temperance in food and drink. He had an impediment in his speech, which, for a long time, would not suffer him to pronounce the letter "r." Moreover, he had a weak voice, a short breath, and a very uncouth and ungracious manner; yet, by dint of resolution and infinite pains, he overcame all these defects. He accustomed himself to climb up steep and craggy places to facilitate his breathing and strengthen his voice; he declaimed with pebbles in his mouth to remedy the imperfection in his speech; he placed a looking-glass before him to correct the awkwardness of his gesture; and he learned from the best actors the proper graces of action and pronunciation.

But, whatever stress he laid upon the exterior part of speaking, he was also very careful about the matter and the style. The latter he formed upon the model of Thucydides, whose history for that purpose he transcribed eight times. So intent was he upon his study that he would often retire into a cave of the earth, and shave half his head, so that he could not, with decency, appear abroad until his hair was grown again. He also accustomed himself to harangue on the seashore, where the agitation of the waves gave him an idea of the motions in a popular assembly, and served to prepare and fortify him against them. Doubtless it was this energetic application to study which led those who envied his success to say that his orations "smelt of the lamp"; but he would truly retort that his lamp did not shine on the same kind of works as theirs.

The orations of Demosthenes, upon which his fame as a statesman chiefly rests, are three "Philippics," against Philip of Macedon; three "Olynthiacs," against Philip's attack on the state of Olynthus; "On the Peace," "On the Embassy," "On the Affairs of the Chersonese," and "On the Crown." The latter contains a defense of his career, and by many is regarded as his masterpiece.

CICERO

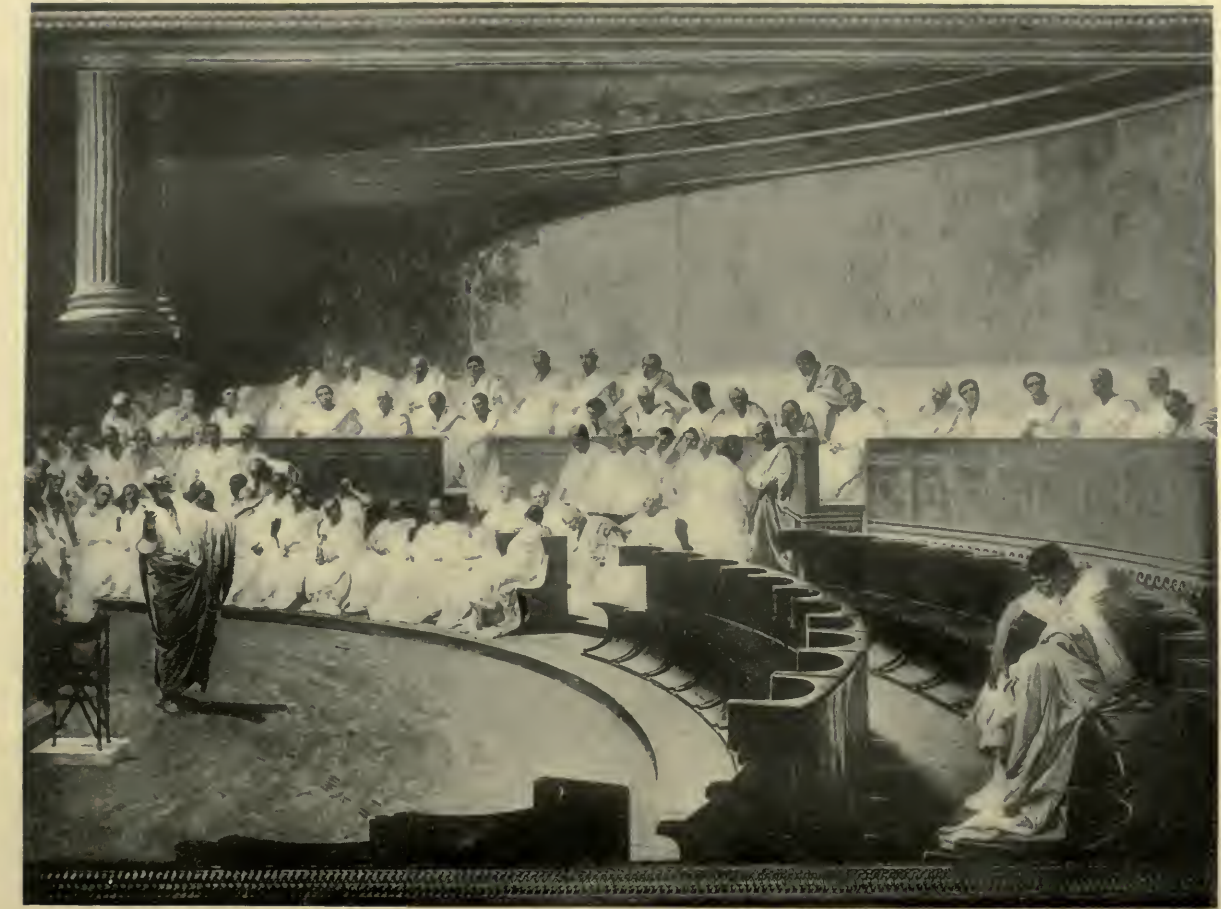
B. C.		AGE
106	Born at Arpinum, Italy,	..
89	Served in social war,	17
79–77	Traveled in Greece and Asia,	27–29
75	Quæstor in Sicily,	31
70	Accused Verres,	36
69	Ædile,	37
66	Prætor,	40
63	Consul; suppressed Catiline's conspiracy,	43
58	Banished to Thessalonica,	48
51–50	Proconsul of Cilicia,	55–56
49	Allied himself with Pompey,	57
44–43	Delivered his "Philippics" against Antony,	62–63
43	Proscribed and slain,	63

MARCUS TULLIUS CICERO, the foremost orator of ancient Rome, a leading statesman, and the most brilliant of Roman men of letters, lived in the stirring later days of the Roman republic. On every hand were revolutions and civil wars. An old and decaying order of things was passing away. It was an age of great and daring spirits — Catiline, Cæsar, Pompey, Antony — with whose history Cicero's life was closely intertwined.

He was born at the old Italian town of Arpinum, in Latium, of a good family, in 106 B. C. He inherited from his father, who was a man of considerable culture, a large estate, and as a boy went to Rome, where he studied law, oratory, Greek philosophy, and Greek literature. He here acquired, in fact, the universal knowledge which he himself says in his essay "On the Orator" — *De Oratore* — an orator ought to possess. At the age of seventeen he served a few months as a soldier in the Marsic war; but the forum had a much stronger appeal for him than the career of a soldier, and to this he devoted his talents. He soon became prominent in the law courts, and made his first speech, in his twenty-sixth year, in a criminal trial in which his client sought redress against one of the favorites of the powerful Sulla, then dictator. After a visit to Athens, and a tour in Asia Minor, where he profited by the society of eminent professors of rhetoric and men of letters, he returned to Rome, and at thirty years of age was in the highest repute in the Roman courts.

About this time Cicero was appointed to the office of quæstor in Sicily, his duty being to supervise the corn supply of Rome, coming from that province. Here it was that he discovered the tomb of Archimedes, the celebrated natural philosopher; and years afterward — 70 B. C. — at the request of the Sicilians, undertook the impeachment of the infamous Verres, the result of which raised him to the pinnacle of reputation. In 66 B. C., at forty, he became prætor, and supported in a great speech the passing of the Manilian law, which constituted Pompey commander against Mithridates, with extraordinary powers, in the place of Lucullus.

Pompey was at this period accepted by the Roman oligarchy as their leader, though not without reluctance and distrust. Cicero gladly attached himself to their cause, and flattered himself with the hope of reconciling the senate with the knights by a more liberal and genial policy. Meanwhile, he hoped, by favor of the dominant party, to attain the consulship. He found himself a candidate for that magistracy along with Catiline, a man of ruined character and already under suspicion of plotting against the state. Cicero obtained



CICERO DENOUNCING CATILINE

From a painting by C. Maccari

the consulship; Catiline was defeated, and thereupon betook himself to those treasonable machinations that are familiar to every student of Roman history. It was the business of Cicero to track these intrigues and defeat them. In one of the greatest philippics in any language, he mercilessly arraigned Catiline in the Roman senate; and the vigor and courage with which he conducted himself at this crisis won for him, by popular acclamation, the title of "father of his country."

But the nobles ill requited the service he had done them. They now felt themselves serene in their ascendancy. Meanwhile, Cicero's enemies became more emboldened. Clodius, a worthless demagogue, assailed him with a formal charge of putting citizens to death summarily without appeal to the people. In vain did he assume the garb of mourning and traverse the streets as a suppliant. The magnates stood coldly aloof, and the factions arrayed against him did not scruple to menace his scanty defenders with violence. Cicero was obliged to seek safety in flight, and withdrew to Thessalonica. Clodius obtained a decree of the people for his banishment four hundred miles from the city, and the destruction of his house on the Palatine, the site to be devoted to the erection of a temple of liberty.

Pompey and Cæsar had suffered Cicero to undergo this humiliation for their own purposes, but they were not disposed to submit to the arrogance of the upstart Clodius, who was now making himself generally obnoxious. In the following year they let it be understood that the persecution should cease. The partisans of Clodius raised tumults in the city, but they were speedily put down, and a resolution for the exile's recall was carried in the assembly of the people.

Cicero had betrayed much weakness under banishment. The exultation with which he triumphed on his return was hardly more dignified. The senate, however, complimented him by coming forth to meet him, and the state undertook the restoration of his mansion. The armed opposition of Clodius was met by a counter demonstration on the part of Milo, a no less turbulent instrument of the oligarchy. But Cicero now felt himself powerless in the presence of chiefs of armies and leaders of factions. He attached himself more closely to Pompey, and devoted his eloquence to the defense of his patron's creatures, while he courted more and more the pursuit of literature in retirement.

The attainment of a seat in the college of augurs on the death of Crassus, 53 B. C., placed him in a position of dignity well suited to his tastes. But Cæsar, though now absent in Gaul, was rapidly becoming a great power in the state, and Cicero did not fail to pay court to him also, proposing to celebrate his British wars in an epic poem. The death of Clodius, in 52 B. C., whose slayer, Milo, he defended, relieved him from the apprehension he had never yet shaken off. He accepted, though not without reluctance, the lot which assigned him the government of Cilicia for the year following. His conduct in this post seems to have been highly meritorious. He checked the corruption of his officials while he preserved his own purity; and, distasteful as warlike affairs were to his studious and quiet temper, he did not shrink from leading his troops against the restless mountaineers. His vanity induced him to pretend to a triumph for his success in these trifling operations; but in those degenerate days greater victories than his would have failed to secure such an honor, unless backed by the influence of the leaders of party, and neither Pompey nor Cæsar was disposed to indulge him.

The civil war between these two rivals was now imminent. Cicero naturally threw himself into the ranks of the senatorial or conservative party, which was blindly following the lead of Pompey; but he was coldly received by the violent men who ruled it, to whom his old-fashioned patriotism was utterly distasteful. Reluctantly and with much misgiving he quitted Italy in the train of the senate and consented to set up a shadow of the commonwealth on a foreign shore; while Cæsar attached to himself in the city, as dictator and consul, both the substance and forms of constitutional power. After the disaster of Pharsalia and the rout of the senatorial forces, Cicero quickly threw aside his arms and returned to Italy, where Cæsar had left Antony in command. He was soon relieved from apprehensions for his own safety by kind assurances from the victor, and, while Cæsar was occupied in Egypt, Africa, and Spain, he withdrew altogether from public life.

During this period, however, he abstained from making advances to Cæsar, and did himself honor by composing a panegyric upon Cato, to which Cæsar condescended to make an ill-tempered reply. But the conqueror's clemency to Marcellus at last won his heart, and now, after the death of Pompey, Cato, and Scipio, with all the other chiefs of his party, he could not refrain from declaring warmly in favor of the new ruler. Cæsar felt the compliment, and repaid it by sparing, at his instance, the life of Ligarius.

The conduct of Cicero at this critical moment was undoubtedly the most truly politic. Other republicans, such as Brutus and Cassius, who had espoused the senatorial cause with feverish zeal or angry factiousness, did not scruple to give their actual support to the new government, and to accept office under it, while they secretly chafed against it and threw themselves into a conspiracy against the life of their master. The difference between their spirit and that of Cicero is marked by the fact that, in the plot to murder Cæsar, which numbered, it was said, as many as eighty men of public note, Cicero himself was not included. The covert assassins dared not consult with men of true honor. So, too, when the liberators, as they called themselves, repaired to the provinces to strengthen their party against the Cæsarians, Cicero declined to undertake active service.

After the death of Cæsar, Cicero remained in Italy, and employed himself in guiding, as he thought, the conduct of the young Octavius, the nephew and heir of the dictator. This crafty dissembler promised well, and Cicero expected to be able to use him as a convenient opponent to Antony. It must be confessed that the veteran statesman was himself playing a part, and dissembling with the youth whom he meant eventually to throw aside. It was a game on both sides, and Octavius won it. He looked on with satisfaction while Cicero excited the passions of the citizens against Antony, in the series of orations to which he gave the name of "Philippics," while he armed the consuls Hirtius and Pansa to overthrow him.

The orator, now advanced in years, showed at this crisis all the vigor with which he had encountered Catiline twenty years earlier. To him the people intrusted the government of the city, and while all the forces of the republic were concentrated under various leaders on the Cisalpine, he might have fancied himself for a moment the real controller of affairs. But after the death of Hirtius and Pansa in the battles before Mutina, and the discomfiture of the republicans under Decimus Brutus, the opposing leaders, Octavius, Antonius, and Lepidus, formed a compact, and assumed to be a triumvirate, or a board of three special officers for the regulation of the commonwealth.

Their arrival at Rome was followed by bloody proscriptions of their public and private enemies. Antony demanded the head of Cicero, and Octavius yielded it. Old and feeble, the orator fled to his villa at Formiæ, pursued by the soldiers of Antony, and was overtaken as he was being carried in a litter. With a calm courage he put his head out of the litter and bade the murderers strike; and his throat was cut by one of Antony's bravos. His head and hands were then cut off and sent to Rome, where Antony caused them to be affixed to the rostra, and Fulvia, the widow of Clodius and the wife of Antony, pierced with her needle the tongue which had declaimed against both her husbands.

Cicero perished at the close of the year 43 B. C., at the age of sixty-three. Octavius, in his later years, as the emperor Augustus, coolly said of the great statesman and patriot to whose murder he had consented, "He was a good citizen, who really loved his country." The saying was indeed well deserved, but it should have come from purer lips.

The character of Cicero has been depicted by panegyrists, and by calumniators. As usual, the truth probably lies between the extreme views. His virtues far outnumbered his vices and foibles. It is true he never lived happily with his wife, Terentia, and that he repudiated her according to the law of the times. Nor was it made a matter of reflection upon him that he afterward married his own ward, Publia, wealthy as well as beautiful. The young bride seems, however, to have contributed nothing to his domestic happiness, and he soon repudiated her, too, for the satisfaction she had seemed to evince at the death of his much-loved daughter, Tullia.

It has been charged against Cicero that he was deficient in prudence, decision, and fortitude; but the chief charge against him has been vanity, which led him into his worst errors. He was not a great or a wise politician; but throughout his whole political career he was a true patriot. He loved not only his country, but mankind in general. He loved them not merely from a kindly nature, but from reflection and self-discipline. As a specimen of the highest culture of the ancient world, both moral and intellectual, he must ever stand preëminent.

He was a wiser if not a more sincere patriot than Cato; his private virtues were subjected to a severer test than those of Marcus Aurelius. His intellectual superiority is sufficiently attested by the important place he attained in the face of many disadvantages, in the conduct of public affairs. As a man he was distinguished by steadfast integrity and justice, "faithful among the faithless" of the time. Learned, philosophic, and genial, he won a host of friends, and was singularly free from envy and jealousy of rivals.

His religion was that of a theist, emancipated from legend and superstition. He believed, though without bigotry, in the immortality of the soul. His ethical system was practical and high-toned, as the third part of his work "On Duties" will show. He there discusses the question, whether a man, in dealing with another, may conceal important facts, as, if bringing corn to a famine-struck town, the fact that other cornships are on their way. He decides in favor of openness. What it is for the interests of others to know, he in effect says, should not be withheld from them.

Cicero's enduring fame, however, will rest on his philosophical writings quite as much, perhaps, as on his qualities as an orator. He was one of the principal channels through which Greek thought and culture diffused itself in the Roman world. His philosophy shows the enlargement of view that followed from the establishment of the Roman state. Two conceptions became much clearer through him than they had been to the Greeks; duty to country, duty to man as man. Rome, which had stimulated patriotism, first developed the consciousness of humanity. "The fellowship of the human race," "the citizenship of the world," are phrases very prominent in his writings. Notable, too, is the influence of the "Roman peace" in his glorifications of human industry, "by which a new nature had been brought into the natural world."

The great bulk of Cicero's works may be conveniently classed as (1) political, (2) philosophical, (3) personal. The first division comprises a collection of fifty-six speeches delivered in the forum or the courts, though some of them were written for publication and not actually delivered. Among these are: "For the Manilian Law," "Against Catiline," "On the Agrarian Law," "Against Verres," "For Archias," "For Milo," "Against Piso," "For Marcellus," and the "Philippics," so-called. Besides the speeches themselves, Cicero produced several treatises on the subject of oratory, which, as part of the Roman training for public life, may be regarded as political. Of these the principal are, "On the Orator" and "Brutus." To this division belong still more strictly the important works, "On Laws" and "On the Republic," which contain valuable references to the events of early Roman history.

To the second division belong the famous treatises on philosophy, from which we derive most of our knowledge concerning the Greek systems which succeeded to the schools of Plato and Aristotle, and in which it became the fashion to affect an interest at Rome. Of these, "The Academics," the "Tusculan Disputations," the "True Ends of Life," and others which have been lost, were devoted to speculative questions; the works, "On Divination" and "On the Nature of the Gods," refer more strictly to theological traditions; while the book "On Duties" is an elaborate treatise on moral obligations. The smaller works, "On Old Age" and "On Friendship," may also be placed more or less definitely under the head of practical philosophy.

Last to be named are his "Familiar Letters," of which about eight thousand are extant, half of them being addressed to his lifelong friend, Atticus. "These," says Middleton, his admiring English biographer, "may justly be called the memoirs of the times, for they contain not only a distinct account of every memorable event, but lay open the springs and motives whence each of them proceeded." His works as a whole form the most authentic monuments of the events of his age. Moreover, in addition to their intrinsic worth, philosophical, historical, and biographical, they possess the charm of consummate literary style, and present to us the Latin language at its highest pitch of development.

"Cicero," says Dr. Vicesimus Knox, "the world's great model in the oratorical and the philosophical, is no less eminent in the epistolary style. He rivaled his great patterns, the Greeks, in eloquence and philosophy; and he excelled them in his letters."

VERGIL, OR VIRGIL

B. C.		AGE
70	Born near Mantua, Italy,	..
65	Assumed the *toga virilis*,	15
42–37	Wrote his *Bucolica*, or "Eclogues,"	28–33
41	Ejected from his paternal farm by soldiers of Octavius,	29
40	Restored to estates,	30
37	Settled at Rome,	33
37–30	Wrote his *Georgica*,	33–40
29–19	Wrote the *Æneid*,	41–51
19	At Athens; died at Brundisium, Italy,	51

PUBLIUS VERGILIUS MARO, commonly called VERGIL, or VIRGIL, greatest of the Roman poets, was about thirty years younger than Julius Cæsar and Lucretius, and a little older than Augustus, Mæcenas, and Horace. It is thought by critics that his name was written VERGILIUS, the first syllable suggesting a Gallic descent, and that he was not by birth a Roman citizen.

Vergil was born at Andes, a small village near Mantua, in the first consulate of Pompey and Crassus, 70 B. C. His father was a well-to-do farmer of the Cisalpine province, and gave his son the best education. He assumed the *toga virilis* of the Roman citizen at the age of fifteen, and studied at Cremona, Milan, and then at Rome. He studied, also, at Naples under Parthenius, a native of Bithynia, and at Rome was instructed in the principles of Epicurean philosophy. With delicate health and of nervous temperament the young student shrank from arms and from oratory. But he devoted himself to study with intense application, and thus laid the foundation of that varied learning, for which he was scarcely less remarkable than for poetical genius.

It is uncertain how long he may have been absent from home, and merely a reasonable conjecture that, after completing his studies, he returned to his paternal farm and there wrote some of the small pieces which are attributed to him. But his peaceful seclusion was disturbed by an unexpected event, which is believed to be alluded to in his first "Eclogue." Octavius Cæsar (Augustus), on his return to Italy after the battle of Philippi, 42 B. C., assigned to a portion of his veterans the lands in the neighborhood of Mantua, thereby depriving Vergil of his patrimony, which, however, was afterward restored to him by the intercession of powerful friends. Soon after this occurrence—probably 37 B. C.—Vergil settled at Rome, and was introduced to Augustus, and to his minister, Mæcenas, the munificent patron of genius, and continued during the remainder of his life to enjoy their friendship and patronage.

In 19 B. C. he visited Greece, intending to make a tour of that country, and to revise and perfect his *Æneid;* but having met the emperor at Athens on his return from the East, and finding his feeble health fast declining, he resolved to accompany him to Italy. He succeeded in reaching the shores of his native country, and died soon after his arrival at Brundisium on the 22d of September, 19 B. C., before completing his fifty-first year. In compliance with his wish, his body was conveyed to Naples, and there buried at the distance of about two miles from the city, at Posilipo, where a monument, traditionally said to be his, is still shown. From his own time, Posilipo has been a place of religious pilgrimage and superstitious reverence.

No life recorded offers a more complete dedication to one great purpose, or a more serene and unbroken concentration of powers on the poetic office. The poet was tall, dark, and somewhat rustic in air; modest, shy, retiring in disposition, and somewhat proud; a confirmed invalid, and never married. His life and his verse were pure and refined, full of a deep religious melancholy; he lived apart from all the storms and distractions around him, both public and private. Simplicity, honor, conscientiousness, are the words by which he is described by his closest friends.

As already intimated, Vergil was born under the republic before the Italians across the Po had received the Roman citizenship. He was twenty-two when the battle of Pharsalia made Julius dictator of the civilized world; and he was thirty-nine when the battle of Actium made his friend Augustus supreme ruler. The poet, deeply sympathizing with the new hopes for an era of peace and order, saw in the imperial dictatorship an epoch of prosperity and stability; and in the unification of the Roman provinces the prospect of a greater Rome to be. His whole career was inspired by a mission to idealize this future of peaceful development, with Rome as the protector and leader of the world. His works consist of, (1) *Bucolica*, or "Eclogues," pastoral poems, amounting to ten, written 42–37 B. C.; (2) *Georgica*, "Georgics," an agricultural poem in four books, written 37–30 B. C.; (3) *Æneis*, or the *Æneid*, a national epic poem, in twelve books, written about 29–19 B. C., besides some minor poems which are ascribed to him. The "Eclogues" are doubtless his earliest productions, and must, therefore, be estimated chiefly as indications of the future efforts of the poet. In the "Georgics" the powers of the poet are more matured; freshness and vigor are given to a subject possessing but little of the poetical element; and the rude and rough hexameter of Lucretius is advanced to a degree of perfection which cannot be surpassed.

But the *Æneid* is the central work of his life. Its form is found in the Homeric world of the ideal heroes; but its inner spirit is a continuous appeal to the sense of national dignity and to the patriotic hopes of his countrymen. Thus the poem is surrounded with all the halo of the Homeric legend; and, though being in form a continuation of the *Iliad* and the *Odyssey*, in substance it is the epic of the national fortunes, alive with patriotic memories and hopes in every part, rousing the Roman race to a sense of greater glories to come and a new mission to fulfill. The center of this new epoch was the dictatorship vested in the house of Julius Cæsar, which the poem is designed to glorify, and almost to deify.

But Vergil was no court flatterer. He was a patriot, and an enthusiast, who profoundly believed in a social and political revolution, under which the transition from the ancient world to the modern was ultimately effected. Not in the ways anticipated by the poet, who, like most of the greater Romans of the early empire, from Cæsar to Marcus Aurelius, believed in a moral, social, and religious regeneration of the world without the revolution embodied in Christianity and Mosaism. It was an error; but it was a noble mistake. And the idea of this moral, material, social, and religious revivification of the ancient society under a beneficent emperor was never put in a finer and more religious spirit than it was in the *Æneid*, under its peaceful, beneficient, pious hero, Æneas. Indeed, the whole epic is a poetical analogue of Augustine's "City of God," a pagan idealization of the city of the deified emperor. And it is this idea of a religious regeneration of mankind to be worked out under the leadership of Rome, as prefigured in his early poem, the *Pollio*, or fourth "Eclogue," which gave Vergil his vast influence throughout the Catholic period.

This vision of a peaceful reorganization of the world, and the intense social and religious earnestness of Vergil, separate the *Æneid* from all the literary epics, ancient or modern, and place it alongside of the *Divina Commedia* and the *Paradise Lost*. His ideal of the destiny and mission of Rome is inferior to the ideal of Dante and Milton — the destiny and mission of humanity. But it is less vague and less superhuman; it is more real, more definite, and more true to fact. The Augustan age is often compared to that of Louis XIV., but it was far larger and with a grander future before it. Vergil combines Corneille and Racine, and surpasses both. He displays the heroic types, the moral elevation, the massive dignity of Corneille, together with the religious spirit, the learning, the pathos, the consummate mastery over language of Racine. But his theme is far less artificial, remote, and literary than that of any of the French or the Italian tragic and epic poets, save Dante alone. He was not presenting an historical picture, or dealing with an imaginary world: he believed in the reality or the mythology which he used as his machinery; and his main object was to present to his own countrymen the past, the future, and the dignity of their common country. In this conception of human progress, unity, and life, he makes a step toward the ideal poet of humanity.

Vergil was one of the most learned and most serious of all poets. Like Dante, Milton, and Racine, he was profoundly saturated with the best culture of his age. He lived in personal relations with the great statesmen of his epoch, but meditated on the world of action from a distant and poetic retirement. Happily, his life was free from the cares and disappointments which weighed on the three poets whom he most resembles.

Of all poets, Vergil was perhaps the most intensely conscientious and laborious. He said that he produced verses as a bear does her cubs, by licking them into shape. In twenty-four years of incessant labor, he wrote less than 13,000 verses. He spent seven years on the 2,188 lines of the "Georgics," and eleven years on the *Æneid*, which consists of only 9,896 lines, and which was unfinished at his death. He gave a characteristic proof of his passion for perfection, when he directed his friends to destroy the manuscript to which his final touches were still wanting. Fortunately, at the order of Augustus, they disobeyed the poet, and saved to the world the great Roman masterpiece.

Roman poetry is less spontaneous, less imaginative, and more artificial than that of Greece; but, from the social point of view, its higher level has a finer moral power; it has a nobler personality beneath its voices, and is more fully inspired with a national mission. In all this, Vergil stands preëminent as the national poet of Rome; and since his time he has always remained the supreme poet of the Latin race. In the middle ages, Vergil exerted the same spell, and even in church hymns was addressed as *pœtarum maxime.* The reverential devotion of Dante to Vergil led him to personify the poet of Italy as earthly wisdom: "My master and my author," as he is invoked in the "Divine Comedy." And all through the mediæval and renaissance epochs, and down to the rise of the revolutionary and romantic outburst of the last century, Vergil reigned supreme. We can now see how vastly inferior he is in native purity and in sublime imagination to Homer and Æschylus; but we can also see better than ever how completely he embodied the dignity and social greatness of Rome, as it passed from a turbulent republic into a world-wide dictatorship.

It is not necessary here to enlarge on the consummate mastery over language possessed by Vergil, the majestic roll of his matchless hexameter, the symmetry and perfection of his poetic form; on his immense learning and philosophic spirit; on the deeply practical and moral force of his appeals to duty and heroism; on his spiritual presentment of human life and death; on his refined picture of the great and just ruler of men; on his consummate gift of tenderness, and the intense pathos with which he has painted heroic women; or on the style which makes him the best known of the ancients by virtue of his massive and monumental embodiment of noble thought. Inferior as he is in spontaneous imagination to the greatest poets of Greece — to Dante and Ariosto, to Shakespeare and Milton — he will always remain, by virtue of his unique historical position, one of the greatest poets of the world.

The qualities of the genius of Vergil have been thus summed up by Saint-Beuve: "Warm love of nature, love of poetry; respect for the great poets, and judicious imitation of their beauties, the erudition and science of the antiquary; patriotism, the price of being a Roman citizen, humanity, piety, sensibility, and tenderness. But, above all, his principal characteristic and perfection is that sovereign quality which embraces in it, and unites all the others — a quality which appears also in the genius of Raphael — unity of tone and color, harmony, fitness of parts, proportion, and sustained good taste."

PLUTARCH

Wise, honest Plutarch! to thy deathless praise
The sons of Rome this grateful statue raise;
For why? Both Greece and Rome thy fame have shar'd;
Their heroes written, and their lives compar'd.
But thou thyself couldst never write thy own:
Their lives had parallels, but thine has none.

— *Dryden.*

PLUTARCH, the most famous biographer in history, and a moralist as well, has left us a very imperfect account of his own life. But it is probably sufficient that we know him as the author of the incomparable *Lives.*

From his own writings we gather that he was a native of Chæronea, in Bœotia, and was a youthful student when Nero visited Delphi, in 66 A. D. He was probably born between the years 45 and 50, of the first century, A. D. He belonged to a good family, members of which occupied those high municipal offices that he himself in turn filled when he went back to settle at Chæronea after his long travels. He held it to be a point of honor to give to the place of his birth some of the celebrity he had himself acquired. "Born in a little town," he used to say, with simple pride, "I love to live there in order that it should not become still smaller."

Plutarch prosecuted his studies at Athens, under Ammonius of Alexandria, in whose house he dwelt. His preliminary education having been completed, he set out upon his travels, first visiting Egypt, where he began to accumulate his vast stores of historical and mythological lore. In his treatise of "Isis and Osiris" he has described the principal ideas he entertained of the Egyptian religion, and this work possesses for us a singular interest. From this period, Plutarch systematically wrote down descriptions of what he saw, diligently examined public and private records, and composed collections of memoirs which eventually were of the greatest use to the historian and the moralist.

On his return to Greece he visited the principal academies, and resided for some time at Sparta for the express purpose of studying on the spot the mechanism of its ancient government and of its legislation. Wherever he went he gathered facts and notable sayings, consulting, for the purpose, books, statues, medals, inscriptions, and paintings. "He appears," says one of his ancient biographers, "to have had his memory always engaged in collecting information, and his judgment ceaselessly occupied in discerning what it was necessary to reject or retain."

Applying the same attention to the study of the positive sciences, and then to medicine, to the laws of health, and to other matters of a practical kind, and being eager, above all things, to become acquainted with the history and development of the philosophic sects, Plutarch apparently remained ignorant of nothing that was known in his time.

Before repairing to Rome, he was sent by his fellow citizens on a mission to the proconsul of Achaia — a circumstance which attests the public esteem he was already beginning to enjoy. It was long believed, on the authority of Suidas, that he was the tutor of Trojan, who, on being raised to the imperial purple, appointed him consul, and heaped honors and wealth upon him. This is probably a mere invention. It is likely that Plutarch's residence in Rome, which extended over more than a quarter of a century, was interrupted by frequent visits to Greece. During his long stay in the "eternal city" he did not find time, according to his own admission, to acquire a knowledge of the Latin tongue. He learned, indeed, the names of ordinary objects, but it was not until late in life that he applied himself to the study of Latin literature.

Many celebrated Greeks attended his courses of philosophy, and not a few of his auditors belonged to the Roman aristocracy. He spoke fluently, being aided by notes carefully prepared beforehand, which in his old age he edited, and gave to his thoughts the form in which they have descended to us. In the same way he has preserved his "Table Talk," the substance of familiar conversations which he held, chiefly at Rome, with men of rank and talent; so that it is possible to follow the development of his ideas and his doctrines during that long space of time.

From various passages in his works it appears that while at Rome he was also intrusted by his fellow citizens with some kind of public office, like that of the modern *charge d'affaires*, and it is to be regretted that he has not more fully explained the nature and the duties of this post.

The period at which he returned to establish himself at Chæronea is uncertain. He was there elected archon, and then he filled the humble post of inspector of buildings. His renown was at this time spread over all Greece. Athens accorded to him the right of citizenship; Corinth and Elis invited him to their grand civic feasts; he was priest of the oracle of Apollo at Delphi. Foreigners who visited the principal cities of Greece went to see him, and accounted it an honor to be received at his home. His home was that of a sage, and he lived in tranquillity in the midst of his family. In this quiet retirement, Plutarch, reposing at the close of an extremely laborious life, put in order his voluminous notes and documents, and composed the works which have made his name immortal.

The character of Plutarch is more intimately known to us than the facts regarding his life. He was a well-bred, well-trained, well-read, genial, just, and honorable moralist of the old school: somewhat garrulous, sententious, and credulous, but overflowing with interesting anecdote, a consummate master of life-like portraiture, with a deep foundation of pure, simple, and humane morality. He was an enlightened and pious polytheist, verging on monotheism of the neo-Platonic kind; who, without much sympathy for modern Roman culture, and without much knowledge of the Roman empire at its highest grandeur, devoted himself to devising a spontaneous scheme of practical ethics. His ethical writings, called in Latin *Moralia*, are among the most valuable pictures we possess of antique manners and thoughts. But they are surpassed by the *Parallel Lives*, or studies of character of illustrious Greeks and Romans in pairs, from Theseus to his own age. There were in all some fifty lives, of which fourteen are lost, and unfortunately in that number are those of Epaminondas, Scipio, and the early Cæsars.

Plutarch was not a philosopher, for he had no powers of original thought and very little precision of reasoning; nor was he an historian, or at all interested in the evolution of civilization as a whole. He was, as he justly describes himself, a moralist, a student of character; and his *Lives* are pictures of human nature, not narratives of events. Like Dr. Johnson, in a much later age, Plutarch always turns to the moral and human side of every incident; he was a great talker, a keen judge of moral actions, and was himself the oracle of a highly cultured society, living apart from the world of affairs toward the latter years of one declining epoch, and profoundly unconscious of the new epoch which was to succeed it. It is significant that Plutarch, a professed student of morality and religion, writing one hundred years after Christ, seems never to have heard of Christianity.

It is needless here to describe the *Parallel Lives*, which, in the library, follow Herodotus and Thucydides. They have been subject to famous eulogies from the time of Montaigne and Henry IV. down to that of Rousseau and Madame Roland — when the great moralist of antiquity had a very real part in forming the tone of the revolutionary movement. The *Lives* appeared in a Latin version in 1470, at Rome; in Greek, at Florence, in 1517; in French, by Amyot, in 1559; in English, by North, in 1579. The latter was used by Shakespeare as his textbook for *Coriolanus, Julius Cæsar*, and *Antony and Cleopatra.* It has been said, and it is hardly an exaggeration, that if all other record of antiquity but Plutarch's were lost, we could still conceive by his aid the general spirit of those ages. And it has often been declared that if we could save but one secular book in the world, the most valuable to preserve would be this unique record of antiquity as a whole.

"In spite of certain reserves that criticism might make," observes a modern critic, "the *Lives* is one of the most excellent books which honor humanity. No known book, not being a work of devotion or of imagination, has ever exerted a greater influence in forming the ideas of generations, or has ever been so well and universally read. Though not a work of history or philosophy, Plutarch's *Lives* still remain for the general public the source of all practical knowledge of the genius of antiquity. His pictures of human nature under military civilization are as immortal as those of Shakespeare and Scott under mediæval and modern manners. It is the book of those who can nobly think, and dare, and do. It is a mirror in which all men may look at themselves."

DANTE

A. D.		AGE
1265	Born at Florence, Italy, ...	..
1289	At victory of Guelphs at Campaldino,	24
1290	Served in expedition against Pisa, .	25
1294	Wrote *Vita Nuova*, ...	29
1300	Commenced *Divina Commedia;* elected one of the priors of Florence, ...	35
1301	Ambassador to Rome on behalf of Bianchi, ...	36

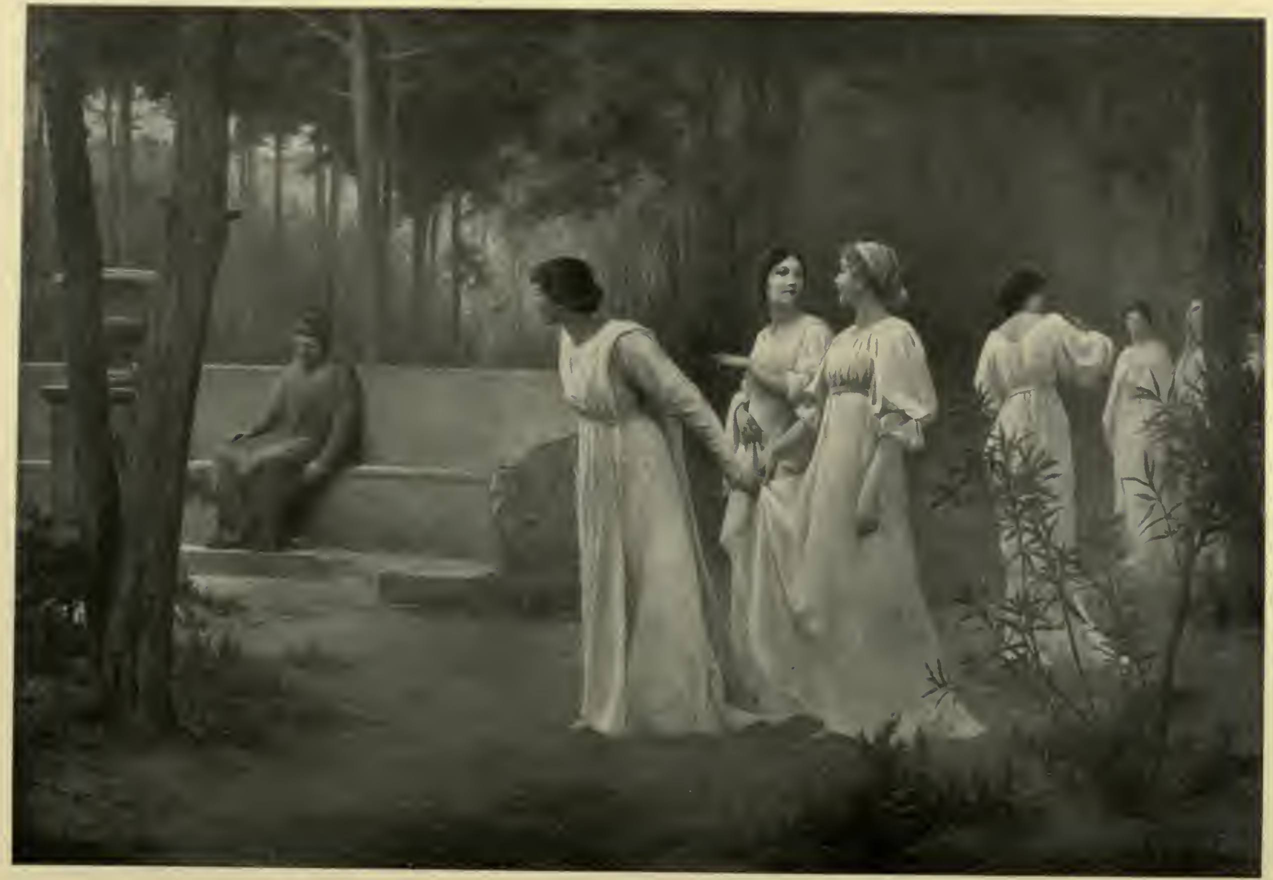
1302	Fined and banished, ...	37
1306	Visits Padua, ...	41
1307–09	Lived chiefly in Verona, Forli, and Casentino; visited Paris, . . .	42–44
1313	Took refuge at Pisa, ...	48
1317	Made his permanent home at Ravenna, ...	52
1318	*Divina Commedia* finished, ...	53
1321	Died at Ravenna, ...	56

DANTE ALIGHIERI, the great Italian poet who opened the roll of modern literature, was born in Florence, Italy, in May, 1265. His father was a lawyer, and a member of the Guelph party, whose family was of honorable and ancient descent, though not on the roll of nobles. The son was baptized Durante, afterward contracted into Dante.

Of Dante's youth little is known. The first fact of importance narrated by all his biographers is the extraordinary affection he conceived for Beatrice Portinari, when only nine years of age. Beatrice was nearly a year younger when they first met at a festival at the house of her father, and Boccaccio says, that "young as Dante was, her image was at once engraved so deeply upon his heart, that from that hour to the end of his life never was it effaced"; and, when she died, he "suffered an affliction so profound, and shed so many and such bitter tears, that his friends believed they could end only in death."



DANTE AND BEATRICE
From the painting of Rieder

Except this early love, too many of the facts and dates connected with Dante's life, which have been the subject of learned discussion, remain, and seem destined to remain, uncertain. The places where he studied, his masters — among whom we only know for a certainty of Brunetto Latini — his friends, if we except Guido Cavalcanti, Giotto, Casella; Charles Martel, king of Hungary; Forese, brother of Corso Donato; his sister Piccarda, and perhaps one or two others whom he names in the poem, are involved in obscurity. It is said, however, that he studied at Bologna, Padua, and at Paris. Boccaccio describes him as skilled in painting and music.

Some years after the death of Beatrice, Dante married Gemma Donati, a lady of noble family, by whom he had five sons, and one daughter, named Beatrice, who took the veil. Three of his sons died young. Pietro and Jacopo lived to edit their father's great poem and write a commentary upon it.

In spite of opinions to the contrary, there seem to be no good reasons for believing the marriage uncongenial.

Dante appears to have early taken an active part in public affairs; and we hear of him when quite young, as having fought against the Ghibellines at Campaldino, in 1289, and also in the wars against the Pisans, in 1290. The fame of his studies, and his reputation for prudence and inviolable firmness and honesty, raised him, while yet in the prime of life, to the highest dignities of the republic. In 1300 he was elected one of the priors of Florence, and probably in the same year began the *Divina Commedia.*

All Italy was at that time divided between the factions of the Guelphs and the Ghibellines—the Guelphs the supporters of the priesthood, and the Ghibellines the supporters of the empire. Florence was at the same time distracted by the quarrels of two powerful families, the Donati and the Cerchi, and their adherents. The discord was increased by the arrival in Florence of the chiefs of the Neri and the Bianchi, two rival factions of Pistoia, who came to submit their differences to the arbitration of the senate. The Bianchi allied themselves with the Cerchi, the Neri with the Donati. In a secret assembly held by the Neri, it was resolved to entreat the pope, Boniface VIII., to invite Charles of Valois to march against Florence, to put an end to these discords and reform the state. The step justly irritated the Bianchi; they armed themselves, and hastened to the priors to accuse their adversaries of conspiring against the public liberty. The Neri armed in their turn, the whole town was in agitation, and a conflict was imminent, when the priors, on the advice of Dante, banished the leaders of both the rival factions.

He thus provoked against himself the hatred of both parties, and that of Boniface and the supporters of Charles of Valois, by causing his offered mediation to be refused. Boniface, who feared and disliked the Bianchi, now urged Charles to march on Florence. He did so, but only to take possession of the town on his own account. The Neri triumphed, and Dante was the principal object of their vengeance. Accused on the strength of a forged document, of extorting money while he was ambassador to Boniface VIII., in 1301, he was sentenced the following year to make pecuniary reparation, and to two years' banishment. His house was given up to pillage, and his lands devastated. Three months afterward, he having neither paid the fine, nor sought to justify himself, his enemies condemned him to be burnt to death. Then began for Dante "the hell of exile — that slow, bitter, lingering death, which none can *know* but the exile himself — that consumption of the soul, which has only *one* hope to console it."

He seems to have several times traversed the whole of Italy, and to have visited Paris. In 1306 we find him at Padua; in 1307, at Casentino; and, in 1309, in Paris. In 1313 he seems to have taken refuge at Pisa, and four years later took up his permanent abode at Ravenna, where he shortly finished the *Divina Commedia.*

He wandered, unshaken by poverty and suffering, "from province to province, from city to city, from court to court, to see if among the heads of parties, among warriors of renown, he might find a man who could or would save Italy, and he found no one." He says of himself that he was tossed about like a ship without sail or rudder, driven through every port, harbor, and shore, by the bleak wind of grievous poverty. He bore himself proudly under his great adversity, taking refuge in his conscience — and when, some time after, he was offered permission to return to the Florence he loved so well, under condition of publicly asking pardon, he refused in a magnificent letter still extant.

In one of his wanderings across the mountains, shortly before his death, Dante knocked at the gate of the monastery of Santa Croce del Corvo. The monk who opened the door to the pale stranger asked, "What seek you here?" Dante gazed around with one of those looks in which the soul speaks from within, and slowly answered, "Peace." "There is in this scene," says Mazzini, "something suggestive of thoughts that lead up to the eternal type of all martyrs of genius and love, praying to his Father, the Father of all, upon the mount of Olives, for peace of soul and strength for the sacrifice."

We last hear of the wanderer at Ravenna, at the house of Guido Novello da Polenta, nephew of the unhappy Francesca da Rimini. Through the influence of Guido, Dante was sent as ambassador to the republic of Venice in 1321. The Venetian senate refused him an audience, and he returned to Ravenna, where he died on September 14th of the same year, at the age of fifty-six.

Dante was buried with great honor, "in the garb of philosopher and poet," at the portal of Saint Peter's church, in the spot where his tomb is still shown. The grave was once threatened with desecration by the papal party; but in 1483 Cardinal Bembo raised the tomb that we now see under much restoration. The Florentines, who twenty years after his death again denounced their great poet as a rebel, an outlaw, and a thief, have many times since in vain sought for his bones. These at the sixth centenary of his birth, 1865, were finally refused by the city of Ravenna — which still remains the last "refuge and resting place" of the greatest of Italians.

The dates and sequence of his .various works are matter of conjecture. Doubtless the *Vita Nuova* is the earliest, and has been given the date 1294. It is an account of his love for Beatrice, written after her death. This exquisite little book is the outpouring of the incense of Dante's soul in gratitude to God for the joy of loving. It is full of purity, gentleness, and delicacy; the prose of much of it has been declared by the greatest of Italian critics to be a finished model of language and style, surpassing the best pages of Boccaccio, while many of the sonnets are far beyond the most admired of Petrarch's, almost untranslatable, so exquisite are they in their construction, and so purely Italian in their harmony.

By far the most celebrated is the *Divina Commedia*, in which he purposes "to say to Beatrice that which never yet was said of any woman." In this version of hell, purgatory, and heaven we have an encyclopedic view of the highest culture and knowledge of the age, expressed in the sublimest and most exquisite poetry, and with consummate power and beauty of language. These three distinct poems describe punishment without end or hope, expiatory sufferings, and eternal felicity. The *Divina Commedia* may be said to have made the Italian language, which was before so rude and unformed that Dante himself hesitated to employ it on such a theme, and is said to have commenced his poem in Latin. No work, probably, in the world, except the Bible, has given rise to so vast a literature.

The limits of a biographical sketch render impossible an adequate description of a work so gigantic as the *Divina Commedia*, which the abbé Lamennais describes as having been created to sum up and be the expression and monument of the whole middle ages, before they passed away into the abyss. "Grand, terrible, and lugubrious is the immense apparition. One feels as if witnessing a mighty funeral, and hearing the service of the dead in a huge cathedral draped in black. Yet, meanwhile, a breath of life, of a life destined to assume a higher and purer development than that which has expired, passes through the aisles, and rises to the vaulted roof of the immense edifice — the quickening of a new life thrills through its mighty womb. The great poem is at once a tomb and a cradle — the splendid tomb of a world passing away, the cradle of a dawning brighter world to come. It is a porch that unites two temples — the temple of the past and the temple of the future. The past has deposited therein its religion, its ideas, its science — as the Egyptians deposited their kings and symbolic gods in the sepulchres of Thebes and Memphis. The future brings to it its born language of a splendid poetry. It is a mystic infant that draws its life from the two sources of sacred tradition and profane fiction — Moses and St. Paul, Homer and Vergil. Its glance turned toward Greece and Rome announces Petrarch, Boccaccio, and a host to come; its thirst for light and knowledge, its eager search into the mysteries of the universe and its laws and constitution, foretell Galileo. Night still broods over the earth, but the horizon is streaked with the coming dawn."

In the *Commedia* Dante's pride of soul is particularly manifested in the disdainful silence he preserves as to his enemies. Not one, save Boniface VIII., whom he deemed it was necessary to punish in the name of religion and Italy, has he placed in hell. He seems to have applied to them the words spoken by Vergil in the beginning of the poem, that they were worthy neither of heaven nor hell. Equally strong in love and hatred, it was the love of right, and the hatred of wrong that inspired him — not love of himself, nor hatred of other men.

The poem, which chronicles the destiny of the human race, chronicles also the poet's own struggles — with the wanderings of his understanding, with the fire of the poet, with the fury of his passions. It chronicles the purification of heart by which he passed from the hell of struggle to the heaven of victory — his desire to live in the future, in the *second life.* The grand thought of a mutual responsibility, joining in one bond the whole human race, was ever before his eyes. The connection between this world and the next is brought forward every moment in the poem. A feeling of tenderness, engendered by this idea, gleams across the *Purgatorio,* and even finds its way into the *Inferno.* The spirits even there anxiously ask for tidings of the earth, and desire to send back news of themselves.

The poem, as a whole, is a complete personification of the intense religious spirit of the middle ages, and fully justifies the title posterity has bestowed upon its author, of the "Christian Homer."

The next most important work is the fragment called the *Convito,* or "Banquet," which takes the form of a commentary on some *canzoni,* or short poems, of the author, of which there are only three, though the work, if completed, would have contained fourteen. The *De Monarchia* (in Latin) expounds Dante's theory of the divinely intended government of the world by a universal emperor acting in harmony with a universal pope. Another unfinished work, *De Vulgari Eloquio,* discusses the origin of languages, and the dialects of Italian in particular. *Canzoniere* is a considerable collection of short poems, sonnets, and other forms of verse; and, finally, we have a dozen epistles addressed mainly to leading statesmen or rulers. There are also some "Eclogues" and other minor works, as well as several of doubtful authenticity.

It is difficult to understand Dante's philosophy without a rather intimate acquaintance with the historical background. The true meaning of the struggle between Guelphism and Ghibellinism must be constantly held in view. The names of Guelph and Ghibelline, which in Germany only conveyed the idea of a family quarrel, signified far more in Italy. In the latter, Ghibellinism was feudality, the *noblesse* — Guelphism was the community, the *people.* If it supported the pope, it was because the pope supported it. The people triumphed, the community established itself irrevocably free and equal; and although, from wealth or military skill, certain noble families still obtained supreme power in some of the towns, the nobility, as a *caste,* was completely effaced. The people, the conquerors, stood embarrassed with their victory. The dawning of the day for the gathering together in one, all the people whose different races had crossed and mingled together in Italy, had not yet arisen. A kind of anarchy, therefore, began in the absence of *one* governing principle single and strong enough to bear down all fractional and personal aims, all local egotisms.

This state of things was complicated by the interference of the French, who were called in by the popes. When Urban IV. called Charles of Anjou into Italy, the patricians — Ghibellines — were averse to him. After the Bianchi and the Neri parties were formed, Boniface VIII. called in Charles of Valois; the Bianchi, who were plebians, were prosecuted, and the Neri, the patricians, then made themselves Guelphs, because they sympathized with Charles, the envoy of Boniface. The Bianchi then allied themselves to the Ghibellines, whose ancient principle of feudalism had been irrevocably crushed.

Dante, who in early life had been a Guelph, was thenceforth a Ghibelline; that is to say, he was always on the side of the people, he always belonged to the element of Italian futurity. He speaks in the *Paradiso* of being a party in himself. Both parties endeavored to enlist him in their ranks, but in vain. He viewed both from the height of a superior aim, an idea which, perhaps, he alone in all Italy at that day had conceived. Beyond all the narrow factions of the period, beyond the emperor, beyond the pope, he saw the future Italian nation, and the divine mission he believed ordained by God for the "holy Roman people."

This idea of national greatness and Italian supremacy is philosophically expressed in the

Convito, politically in *De Monarchia*, in its literary aspect in the treatise *De Vulgari Eloquio*, and poetically and religiously in the *Commedia*. It is as we see him in the minor works that the *man* can best be comprehended, and his leading thoughts grasped and understood. Never man loved his country with a more elevated or fervent love, never man had such projects of magnificent and exalted destinies for her. Relying on the *Convito* and the treatise *De Monarchia* for our authority, the following is a summary of what, in the thirteenth century, Dante believed:

God is one; the universe is one thought of God; the universe, therefore, is one. All things come from God; they all participate more or less in the divine nature, according to the end for which they are created. Flowers in the garden of God all merit our love according to the degree of excellence He has bestowed upon each; of these man is the most eminent, and on him God has bestowed more of His own nature than upon any other creature. In the continuous scale of being, the most degraded man touches upon the animal, the most noble approaches the angel. Everything that comes from the hand of God tends toward the perfection of which it is susceptible. There is this difference between man and the other creatures, that his perfectibility is *indefinite*. Issuing from God, the human soul incessantly aspires toward Him, and seeks by holiness and knowledge to be reunited to Him. The life of the individual man is too short and weak to satisfy this yearning in this world, but before and around him is the whole human race—of which he is a part — that never dies, but moves onward through succeeding generations on the pathway of eternal truth. Mankind is one; God has made nothing in vain. If there exists a multitude, a collection of men, it is because there is *one* aim for them all, only to be accomplished by all. This aim, then, does exist; man must discover and attain it. Mankind must work together toward their highest possible development in the spheres of thought and of action. Only by harmony and association is this possible. Mankind must become *one*, even as God is one; it must be one organization as it is one in principle.

Unity is taught by the manifest design of God in the external world, and by the necessity of an aim. Unity must be a center to which the general inspiration of mankind must ascend, to descend again in the form of law. There must be a power strong in unity and in the support and advice of the highest intellects — destined by nature to rule — providing with calm wisdom for all the different functions which are to be fulfilled; itself the pilot, the supreme chief, in order to bring to the highest perfection what Dante calls "the universal religion of human nature," that is, empire, *imperium*. It will maintain concord among the rulers of state, and this peace will diffuse itself thence into towns, into every cluster of habitations, into every house, into the bosom of each man.

And where is the seat of this empire to be? Here the poet quits all analytical argument, and takes up the language of synthetical and absolute affirmation. "He is no longer a philosopher," says a great Italian critic; "he is now a believer." He points to Rome, the "holy city," as he calls it, "the city whose very stones are worthy of reverence." "There," he says, "is the seat of empire. There never was, there never will be, a people endowed with more gentleness for the exercise of command, with more vigor to maintain it, and more capacity to acquire it, than the Italian nation, and, above all, the holy Roman people. God chose Rome from among the nations. She has twice given unity to the world, and from her the world will again receive it, and for ever."

Dante tells us that there was a time when he did not see the hand of Providence in the dominion of Rome, and his soul revolted at it as a usurpation. Afterward his eyes were opened; in the history of this people he recognized "divine predestination"; it was necessary that the world should be in some sort equalized under the rule of a single power, in order that the preaching of Jesus might give new life to the earth; and God consecrated Rome to this work. When the work was done, Rome rested from her labors, until the second gospel of unity was needed by the world.

Dante develops this argument from the authority of the poets to that of Jesus, who, he says, recognized by his death the legitimacy of the jurisdiction exercised by Rome over the whole human race. With this immense ideal ever present to his mind, Dante looked about for an element of unity as a means of carrying on the providential mission he believed destined to Italy. He chose the only instrument that appeared ready to his hand, the emperor. Rome once recognized as the living symbol of the Christian dualism, the individual called to represent her was, in himself, insignificant; he would pass away; his successor would probably be an Italian; but, whether or not, the inspiration which he would echo would be Italian.

There is not a word in *De Monarchia* which concerns Germany or the emperor. The Roman nation is everything, and, indeed, great care is taken to lay every possible restriction on the man who might endeavor to substitute his own ideas to those of Italy. "Rouse yourselves," he writes to his fellow citizens, "rouse yourselves like free men, and recollect that the emperor is only your first minister. He is made for you, and not you for him."

Here, then, was, in brief, his philosophy. A sincere patriot, and frightened at the symptoms of decay visible in Christian society, he wished to save his compatriots, and he wrote to indicate the way of salvation.

A thorough knowledge of Dante as a philosopher, a poet, and a man displays the unity of an imposing figure, which stands as a type of a whole nation mournful and grand as itself. "The first awakener," says Shelley, "of entranced Europe, he created a language, in itself music and persuasion, out of a chaos of unharmonious barbarisms. He was the congregator of those great spirits who presided over the resurrection of learning; the Lucifer of that starry flock, which, in the thirteenth century, shone forth from republican Italy, as from a heaven, into the darkness of the benighted world."

Boccaccio describes Dante as a figure of middle height, with noble and well-marked features, face long, nose aquiline, eyes large, under lip projecting, complexion dark, hair black, thick, and wavy, the expression of the eyes and mouth especially indicating profound and melancholy feeling. In all his relations he was modest and reserved, speaking rarely but with eloquent force. He was fond of female society, in which he showed much politeness and gaiety. Though simple in his manner of living, he bestowed considerable attention on his dress and general appearance.

After Dante's death a mask was taken, in plaster, of the face, from which terra cotta busts were made, and his best portrait obtained. Here Dante appears with a long and pointed nose, slightly curved; the eyes are deeply sunk beneath strong, evenly arched eyebrows, with a deep wrinkle between them; the mouth has a spiritual and ironic expression, under lip slightly projecting, with chin and cheek bones somewhat prominent. The whole head expresses intellect and vigor, strong will, and habits of meditation. Raphael painted Dante, after the mask likeness, in two of his principal works, and a large number of paintings, statues, and medals have repeated and familiarized his face until it has become one of the most authentic and best-known portraits in existence.

MONTAIGNE

A. D.		AGE
1533	Born at Périgord, France, ...	
1539–46	Studied at Bordeaux, ...	6–13
1554	Municipal councilor of Bordeaux, .	21
1566	Married, ...	33
1580	Traveled in Switzerland, Germany, Italy; his "Essays" published, .	47
1581	Wrote his "Journal of Travels,". .	48
1586	Driven from his château by war of the league, ...	53
1588	Mediated between Henry of Navarre and the duke of Guise, ...	55
1592	Died at Montaigne, Périgord, . . .	59

MICHEL EYQUEM DE MONTAIGNE, the famous French essayist, was born on the feudal estate from which he took his name, in Périgord, France, February 28, 1533. His father, Pierre Eyquem, was a blunt feudal noble, of vigorous and eccentric character, who had his son brought up in one of his peasant's cottages, to inure him in hardy ways of living, and to give him a fellow feeling with the poor.

As soon as he could speak, he was placed under the care of a German tutor, selected for his ignorance of French, and intimate acquaintance with the Greek and Latin languages. All Montaigne's intercourse with his preceptor was carried on in Latin; and even his parents made a rule never to address him except in that language, of which they picked up a sufficient number of words for common purposes. The attendants were enjoined to follow the same practice. "They all became Latinized," says Montaigne himself, "and even the villagers around learned words in that language, some of which took root in the country, and became of common use among the people." Thus, without any formal course of scholastic teaching, Montaigne spoke Latin long before he could speak French, which he was afterward obliged to learn as if it had been a foreign language. He studied Greek also by way of pastime, rather than as a task. The object of his father was to make him learn without constraint and from his own wish. As an instance of his father's whimsical notions on education, he caused his son to be awakened in the morning to the sound of music, that his nervous system might not be injured by any sudden shock. At six years old Montaigne was sent to the college of Guienne, at Bordeaux, an establishment which then enjoyed a very high reputation. He soon made his way to the higher classes; and at thirteen years of age, had completed his college education.

Having no taste for military life, which was then the usual career of young noblemen, Montaigne studied law; and in 1554 was made councilor (or judge) in the parliament of Bordeaux, in which capacity he acted for several years. He went several times to court, and enjoyed the favor of Henry II., by whom (or as some say, by Charles IX.) he was made a gentleman of the king's chamber and knight of the order of St. Michel. Among his brother councilors at Bordeaux there was a young man of distinguished merit, named La Boétie, for whom Montaigne conceived a feeling of the most romantic friendship, which soon became reciprocal. The sentiments and opinions of the two seem to have harmonized to an extraordinary degree. La Boétie died young, but his friend's affection long survived. A chapter of the "Essays" is devoted to his memory, and in other parts of Montaigne's writings we find frequent recurrence to the same subject.

Montaigne married Françoise de la Chassaigne when he was thirty-three years of age; and this he did, as he says, in consequence of external persuasions, for he was not inclined to a married life.

When he succeeded to the family estate, he took the management of it into his own hands; and although his father, judging from his habits of abstraction and seeming carelessness of worldly objects, had foretold that he would ruin his patrimony, Montaigne, at his death, left the property, if not much better, certainly not worse than he found it. He was not rich, for we are told by Balzac that his income did not exceed six thousand livres, which was no great revenue for a country gentleman even at that time.

In 1569 he translated into French a Latin work of Sebonde, or Sebond, in defense of the mysteries and doctrines of the church of Rome against Luther and other Protestant writers. France was at that time desolated by civil and religious wars. Montaigne, although he evidently disapproved of the conduct of the court toward the Protestants, yet remained loyal to the king. But the religious wars filled him with distaste for public life, and he retired to his estates, resolved to spend the rest of his life in study. In his retirement he took no part in public affairs, except to exhort both parties to moderation and mutual charity. By this conduct he became, as it generally happens, obnoxious to both factions, and he incurred some danger in consequence.

The massacre of St. Bartholomew plunged him into a deep melancholy. He detested cruelty and the shedding of blood, and in several passages of his "Essays" has animadverted in strong terms upon the atrocities committed against the Protestants. It was about this dismal epoch of 1572, when, solitude and melancholy urging him to the task, he began to write his celebrated "Essays." They were first published in March, 1580, and had immediate success. After some time a new edition was printed with additions, but without making any alterations in the part which had appeared before. The popularity of the book was such that in a few years there was hardly a man of education in France who had not read it.

Shortly after the first publication of his "Essays," Montaigne undertook a journey for the sake of his health. He went to Germany, Switzerland, and, lastly, to Italy. In Rome he was well received by persons of distinction, and was introduced by Pope Gregory XIII. Montaigne was delighted with Rome; he found himself at home among those localities and monuments which were connected with his earliest studies, and with the first impressions of his childhood. His remarks on what he saw in the course of his journey are those of a man of penetration, sincere and plain spoken, and written in his peculiar antique style. His manuscript journal of these travels, written in 1581, after lying forgotten for nearly two centuries, was discovered in an old chest in the château of his family, and published in 1774 under the title, *Journal du Voyage de Michel de Montaigne.* It is one of the earliest descriptions of Italy in a modern language. In this journey Montaigne received the freedom of the city of Rome, by a special bull of the pope, which he valued as the proudest distinction of his life.

While he was abroad, he was elected mayor of Bordeaux by the votes of the citizens. This honor he would have declined, but that the king, Henry III., insisted on his accepting it. This was a mere honorary office, with no emolument attached to it, and the appointment was for two years. But Montaigne was reëlected at the expiration of that period, which was a mark of public favor of rare occurrence.

On retiring from this office, Montaigne returned to his estate in 1586. The country was then ravaged by the war of the league. He had great difficulty in saving his family and property in the midst of the contending parties, and once narrowly escaped assassination in his château. To add to the miseries of civil war, the plague broke out in his neighborhood in the same year; and he then, with his family, left his home and became a wanderer, residing successively at the houses of various friends in other parts of the country.

It appears from De Thou that he went to Paris in 1588, and engaged in attempts to reconcile Henry of Navarre, afterward Henry IV., and the duke of Guise. Here he made the acquaintance of Mademoiselle de Gournay, whom he regarded as his adopted daughter, and to whom his widow intrusted the task of publishing the first complete edition of his works. This attachment, which, though warm and reciprocal, has every appearance of being purely Platonic, is one of the remarkable incidents of Montaigne's life. At the time of his death, Mademoiselle de Gournay and her mother crossed one-half of France, in spite of the civil troubles and the insecurity of the roads, to mingle their tears with those of his widow and daughter.

On his return from Paris, in the latter part of 1588, Montaigne stopped at Blois, with De Thou, Pasquier, and other friends. The famous states-general was then assembled in that city, where the murder of the duke of Guise, and of his brother, the cardinal, soon after took place. He had long foreseen that the civil dissensions could terminate only with the death of one of the great party leaders. After these events Montaigne returned to his château. In the following year he became acquainted with Pierre Charron, a theological writer of considerable reputation. An intimate friendship ensued between the two authors, and, by his will, Montaigne empowered Charron to assume the coat-of-arms of his family, as he himself had no male issue.

Montaigne's health had been declining for some time. He was afflicted with gravel and colic, and he was obstinately resolved against consulting physicians. In September, 1592, he fell ill of a malignant quinsy, which kept him speechless for three days, during which he had recourse to his pen to signify to his wife his last intentions. He asked that several intimate friends should be requested to come and take leave of him. When they were assembled in his room, a priest said mass, and, at the elevation of the host, Montaigne half raised himself on his bed, with his hands joined together, and in that attitude expired, September 13, 1592, in the sixtieth year of his age. His body was buried at Bordeaux, in the church of Feuillants, where a monument was erected to him by his widow. He left an only daughter, heiress of his property.

Montaigne's "Essays" are among the most remarkable of literary productions. Absolutely without order, method, or, indeed, anything like specific purpose, they have yet exercised an influence, particularly on French and English literature, greater, perhaps, than that of any other single book. Some critics have suffered their indignation against the "confusion of the whole book" to carry them much further than was necessary; for, indeed, it is partly this want of formal arrangement that gives to the "Essays" their peculiar excellence. He is the very opposite of the grave and "regular" scholastics, whom in one of his chapters he describes with an inimitable mixture of drollery and sarcasm, and from the tyranny of whose barren methods none, save Bacon alone, has contributed more toward the deliverance of the human mind. He knows nothing of rules, he will be held to no method. "As things come into my head," he says, "I heap them in." It is not knowledge he offers to the reader, merely "fancies of my own, by which I do not pretend to discover things, but to lay open myself."

One ignorant of his ways might come to the conclusion, from the frequency with which he asserts it, that his principal design was to "paint himself"; and no doubt this he does, and much more perfectly, too, than he conceived. But these touches of self-portraiture, which are met with in almost every page, form but a part, though a considerable one, of the value of the "Essays."

It is quite impossible to convey an adequate notion of their unrestrained vivacity, energy, and fancy, of their boldness and attractive simplicity. They range over every subject connected with human life and manners; abound in observations — often most felicitously expressed — of great depth and acuteness, and never fail to entertain with their constant eagerness and gaiety. It is not too much to say that they supply the mind with at once the best stimulus and recreation, which the world of books contains.

On the whole, Montaigne presents to us a state of mind completely detached from ecclesiastical dogma, but too vigorous and well balanced to accept the partial reforms of Luther and Calvin, which he thought dearly purchased by the long years of rancor and civil strife that followed them. He saw that the Catholic ceremonial stirred men's souls with emotions that raised them to higher things; and he would not throw away a certain good for an imaginary and very doubtful better. The scepticism of Montaigne went far deeper than doubt of church doctrines. It went almost as far as the question asked half a century later by Descartes — "What is there that is certain?"— only that Montaigne could not, like Descartes, find an answer. Science for him was as uncertain as theology. Copernicus, he said, was making a revolution in astronomy, Paracelsus in medicine. But was it certain that these revolutions would not be themselves upset by future inquirers?

His merit is that by simple observation of the facts of human life, inspired by honest and genial sympathy, he tried to build up a human morality, and to lead men into the paths of justice, integrity, and forbearance, without appeal to supernatural fears. He saw clearly the relativity of human knowledge. The senses, through which knowledge entered, were too imperfect and too few to reveal to us more than a fraction of the truth. Intellectual culture was but a small part of life. There seemed to him far more true philosophy in the life and conversation of the peasant than in that of most philosophers and teachers. The first cares to know what is of practical use to him: the professor teaches us to define virtue, but not to follow it.

Montaigne was under the middle size, and considered his diminutiveness not only ugly, but inconvenient for one obliged to fill offices of dignity. In form he was sturdy, and even squat. His face, though not fat, was full; his complexion "varied between the jovial and the melancholy, and his general temperament was moderately sanguine and warm." Up to forty, that is, during his active life, he was in excellent health, having rarely been afflicted with maladies; but at forty, "when he began to be old," perhaps partly in consequence of the sudden change in his mode of life, he was no longer more than half himself. He had never been proficient in bodily exercise, except in running, in which he was tolerable. He had tried to improve in this exercise by adopting a bandage round the body, but found it of no use. In dancing, tennis, wrestling, he was but very moderately successful; and he could never learn to swim, to fence, or to leap, all of which formed part of the military education of his time. His walk was rapid and firm. All these little communications suggest the picture of a quiet country gentleman, who would rather handle a book than a sword; and yet was fond of strolling and riding about, and might often be required to use his heels or his fists to save himself.

The conclusive attestation to Montaigne's varied power is the fact that centuries after his death the circle of his readers widens every year, and that he has now almost as large a following of antiquaries as Shakespeare himself. Of his admirers in every generation it has also to be remarked that they are of all types of mind and creed, and that among them are found men like Pascal, who, while separated from him as by an abyss on all the fundamental problems of life, have acknowledged their debt to his fearless and all-questioning criticism. To have thus commanded the attention of the acutest intellects of every age since his own by haphazard remarks, devoid of all method, and seemingly inspired by the mere caprice of the moment, could be the privilege only of a mind of the highest originality, of the very broadest sympathies, and of a nature capable of embracing and realizing the largest experience of life.

In achieving this distinction, what are reckoned among his chief defects have doubtless stood him in as good stead as his merits. His inconclusive philosophy, his easy opinions on many points of morals, his imperfectly developed sense of duty, the total absence of any heroic strain in his nature, were but the necessary conditions of that general attitude toward men and things which make him the unique figure he is in the history of European literature.

CERVANTES

1615	Second part of *Don Quixote*,	68
1616	Died at Madrid,	69

MIGUEL DE CERVANTES SAAVEDRA, the greatest figure in Spanish literature, was baptized October 9, 1547, at Alcalá de Henares, a town of New Castile, not far from Madrid. The exact date of his birth does not appear; and even the locality has been disputed by several towns, as the Grecian cities contended for the honor due to the birthplace of Homer.

Sprung from noble, but not wealthy, parents, he was sent to the university of Salamanca, and afterward to Madrid, to qualify himself for one or other of the only lucrative professions in Spain — the church, the law, or medicine; but his attention was diverted from this object by a strong propensity for writing verses. Juan Lopez de Hoyos, a teacher of some note, under whom he studied ancient and modern literature, thought Cervantes the most promising of his pupils; and inserted an elegy, and other verses of his favorite's composition, in an account of the funeral of Queen Isabel, wife of Philip II. These, like the greater number of Cervantes' early poems, which are very numerous, do not rise above mediocrity; though the author, who was a long time in discovering that his real talent lay in prose writing, seems to have thought otherwise.

He was an indefatigable reader, and used to stop before the bookstalls in the street, perusing anything that attracted his attention. In this manner he gained that intimate knowledge of the old literature of his country, which is displayed in his works. He thus spent his time reading and writing verses, seemingly heedless of his future subsistence, until the pressure of want, and the ill success of his poetry, drove him to quit Spain and seek his fortune elsewhere. He went to Rome in 1569, and entered the service of Cardinal Giulio Acquaviva; but soon after enlisted as a private in the armament which Pope Pius V. fitted out in 1570, for the relief of Cyprus, then attacked by the Turks. In 1571 he fought in the famous battle of Lepanto, when the combined squadrons of the Christian powers, commanded by Don Juan of Austria, defeated and destroyed the Ottoman fleet. On that memorable day Cervantes received a gunshot wound, which for life deprived him of the use of his left hand. Far, however, from repining, the generous Spaniard always expressed his joyfulness at having purchased the honor of sharing in that victory at that price.

He continued in active service in Italy and elsewhere until 1575, when the vessel in which he was returning to Spain was captured by the Moors, and he was taken to Algiers. Here he remained a prisoner for five years, making numerous but fruitless attempts to escape. At last he was ransomed by his friends for five hundred gold ducats. Early in the following year he returned to Spain. Having met nothing but misfortunes and disappointment in his endeavors to make his fortune in the world, he now determined to return to his literary pursuits.

In 1584 he published his *Galatea*, a pastoral novel. At the end of that year he married Dona Catalina de Palacios Salazar, a lady of ancient family, of the town of Esquivias. The year following he settled in Madrid, and from this time forward he devoted himself to literature. His first attempts were dramatic. But the brilliant genius of Lope de Vega was in the ascendant, and the somber tragedies of Cervantes met with only fair success.

After 1588 Cervantes lived a number of

years at Seville, where he appears to have been employed as a commercial agent, or purveyor to the fleet. It is thought by some authorities that his *Novelas Exemplares*, or "Moral Tales," were written here, though published many years after. On his journeys between Seville and Madrid, to which latter he finally returned, he resided at intervals in the province of La Mancha, which he has rendered famous in his great work, *Don Quixote*. He examined attentively both the country and the people; he saw the cave of Montesinos, the Lagunas de Ruydera, the plain of Montiel, Puerto Lapice, the Batanas, and other places which he has described in *Don Quixote*. Being intrusted with some commission or warrant for recovering certain arrears of tithe due from the village of Argamasilla to the prior of St. John of Consuegra, he incurred the hostility of the villagers, who disputed his powers, and threw him into prison. He fixed upon this village of Argamasilla as the native place of his hero, without, however, mentioning his name, "which," he says at the beginning of the book, "I have no particular wish to remember."

After this occurrence, we find Cervantes living with his family at Valladolid in 1604-05, while Philip III. and his court were residing there. In 1605 the first part of *Don Quixote* appeared at Madrid, whither Cervantes probably removed after the court left Valladolid. It seems at once to have become popular; for four editions were published in the course of a year. But it was assailed with abuse by the fanatical admirers of tales of chivalry, by several dramatic and other poets unfavorably received, and also by some of the partisans of Lope de Vega, who thought that Cervantes had not done justice to their idol.

Cervantes did not publish anything for seven years after the appearance of the first part of *Don Quixote*. He spent this long period in studious retirement at Madrid; and had, by this time, given up all expectations of court favor or patronage, which it would appear that he at one time entertained. Philip III., although remarkably fond of *Don Quixote*, the perusal of which was one of the few things that could draw a smile from his melancholy countenance, was not a patron of literature, and it did not occur to him to inquire about the circumstances of the writer who had afforded him some moments of innocent gratification.

Cervantes, however, gained two friends among the powerful of the time, Don Pedro de Castro, Count de Lemos, and Don Bernardo de Sandoval, archbishop of Toledo. To the first he was introduced by his friends, the two brothers and poets Argensola, who were attached to the household and enjoyed the confidence of the count. In 1610, when Count de Lemos went as viceroy to Naples, Cervantes expected to go with him; but he was disappointed; and he attributed his failure to the coldness and neglect with which his application to that effect was treated by the Argensolas. It is certain, however, that he received from Count de Lemos most substantial marks of favor, and among them a pension for the remainder of his life. To this nobleman Cervantes dedicated the second part of his *Don Quixote*, and other works, with strong expressions of gratitude. The Spanish biographers say, also, that he received assistance in money from the archbishop of Toledo. These benefactions, added to his wife's little property at Esquivias, and the remains of his own small patrimony, kept him above absolute want, though evidently in a state of penury.

In 1613 Cervantes published his *Novelas Exemplares*, or "Moral Tales," to which reference has already been made. They have always been much esteemed, both for the purity of the language and for the descriptions of life and character which they contain. In 1614 he published his *Viage al Parnaso*, or "Journey to Parnassus," in which he passes in review the poets of former ages, as well as his contemporaries, and discusses their merits. While rendering justice to the Argensolas, he alludes to the above-mentioned disappointment which they had caused him. He complains of his own poverty with poetical exaggeration, and styles himself "the Adam of poets."

Cervantes had now nearly finished the second part of his immortal work; but before he had time to send it to press, there appeared a spurious continuation of *Don Quixote*, the author of which assumed the fictitious name of Avellaneda. It was published at Tarragona toward the end of 1614. It is very inferior in style to the original, which it strives to imitate. At the same time, its author did not scruple to lavish vulgar abuse on Cervantes, ridiculing him for the lameness which an honorable wound had entailed upon him, and for his other misfortunes. This disgraceful production was deservedly lashed by the injured author in the second part of *Don Quixote*, which was published in 1615, and received with universal applause. His fame now stood at the highest, and distinguished strangers arriving at Madrid were eager to be introduced to him. His pecuniary circumstances, however, remained at the same low ebb as before. Count de Lemos, who was still at Naples, appears to have been his principal friend.

In October, 1615, Cervantes felt the first attacks of dropsy. He bore the slow progress of this oppressive condition with his usual serenity of mind, and occupied himself in preparing for the press his last production, *Persiles y Sigismunda*, a romance of the North, and in imitation of Heliodorus' Ethiopian story. This romance has ever enjoyed a high degree of favor, and is considered more elegant in style than *Don Quixote.* Indeed, it may be said that, in this respect, the minor works of Cervantes bear the same relation to his masterpiece that the elaborate poems of Shakespeare bear to his incomparable plays.

In the preface to this work, he tells about meeting an admiring student on a journey from Esquivias, where he had been to visit a small estate of his wife's. In a whimsical way the subject of his health was discussed, and he represents himself as saying to the student, "My life is slipping away, and, by the diary my impulse is keeping, which at the latest will end its reckoning this coming Sunday, I have to close my life's account. Your worship has come to know me in a rude moment, since there is no time for me to show my gratitude for the good will you have shown me." After bidding his companion good-by at the bridge of Toledo, he closes with a good-by to all else: "And so farewell to jesting, farewell my merry humors, farewell my gay friends — for I feel that I am dying, and have no desire but soon to see you happy in the other life."

April 2, 1616, he was received into the third order of St. Francis; April 18th he was annointed for death; April 19th he wrote the dedication of *Persiles y Sigismunda* to Count de Lemos, full of gratitude and cheerfulness, "with one foot in the saddle waiting for the call of Death"; and April 23d he died — the same day upon which Shakespeare died. He was buried in the graveyard of the Trinitarian convent, where his widow, his daughter, and other members of his family were afterward laid beside him. In 1635 the convent was removed to another part of the city, and the remains of the members of the order were transferred to a new burial place; but as no distinction of individuals was preserved, the dust of Cervantes has mingled with that of his companions.

Cervantes' great work — *Don Quixote de La Mancha* — is too generally known to require extensive notice. It is one of those few productions which immortalize the literature and language to which they belong. The interest excited by such a work never dies, for it is interwoven with the very nature of man.

The particular circumstances which led Cervantes to the conception of *Don Quixote* have long since ceased to exist. Books of chivalry have been forgotten, and their influence has died away; but Quixotism, under some form or another, remains a characteristic of the human mind in all ages. Man is still the dupe of fictions and of his own imagination, and it is for this that, in reading the story of the aberrations of the knight of La Mancha, and of the mishaps that befell him in his attempt to redress all the wrongs of the world, we cannot help applying the moral of the tale to incidents that pass every day before our own eyes, and to trace similarities between Cervantes' hero and some of our living acquaintances.

The contrast between the lofty, spiritual, single-minded knight and his credulous, simple, yet shrewd, and earth-seeking squire is an unfailing source of amusement to the reader. It has been disputed which of the two characters, Don Quixote or Sancho, is most skillfully drawn, and best supported throughout the story. They are both excellent; both suited to each other. The contrast, also, between the style of the work and its object affords another rich vein of mirth. Cervantes' object was to extirpate by ridicule the whole race of turgid and servile imitators of the older chivalrous tales, which had become a real nuisance in his time, and exercised a very pernicious effect on the minds and taste of the Spaniards. The perusal of those extravagant compositions was the chief pastime of people of every condition. Even clever men acknowledged that they had wasted whole years in this unprofitable occupation, which had spoiled their taste and perverted their imaginations so much that they could not for a long time after take up a book of real history or science without a feeling of weariness. Cervantes was well acquainted with the nature and effects of the disease. He had himself employed much time in such pursuits, and he resolved to prepare a remedy for the public mind. That his example has been taken as a precedent by vulgar and groveling persons, for the purpose of ridiculing all elevation of sentiment, all enthusiasm and sense of honor, forms no just ground of censure on Cervantes, who waged war against that which was false and improbable, and not against that which is noble and natural in the human mind. Nature and truth have their sublimity; and these Cervantes understood and respected.

Shakespeare and Cervantes lived in the same age; they belonged to the same order of mind — the order of sovereign genius. It is rather extraordinary that no well-authenticated portrait exists of either: but Cervantes did what Shakespeare neglected to do — he left a very distinct sketch of his person, which was probably intended to accompany some engraving to be used as a frontispiece to one of his publications.

"Him whom you see here," he says, "with an aquiline visage, chestnut hair, his forehead high and open, with lively, animated eyes, his nose curved, though well proportioned, a silver beard — though not twenty years ago it was golden — large mustachios, a small mouth, but few teeth, and those so bad and ill assorted that they don't care to preserve harmony with each other — a body neither fat nor lean, neither tall nor short — a clear complexion, rather light than brown — a little stooping in the shoulders, and not very quick of foot — that is the author of *Galatea*, of *Don Quixote de La Mancha*, and other works which run through the streets as if they had lost their way, and, perhaps, without the name of their master."

The best epithet ever applied to Shakespeare was that of Ben Jonson, "gentle Shakespeare"; and it is a strange coincidence that no more fitting epithet can be given to the commanding literary genius of Spain. He is gentle Cervantes.

SHAKESPEARE

A. D.		AGE
1564	Born at Stratford-on-Avon, England,	..
1582	Married,	18
1586	Went to London,	22
1589	Actor and playwright, Blackfriars theater,	25
1593	*Venus and Adonis* appears,	29
1594	*Lucrece* written,	30
1597	Purchased "New Place," Stratford,	33
1598	*Romeo and Juliet*, and *Merchant of Venice*, already written,	34
1601	*Twelfth Night; Julius Cæsar*,	37
1602	*Hamlet*,	38
1604	Retired to Stratford; *Othello*,	40
1605	*King Lear*,	41
1610	*The Tempest*,	46
1616	Died at Stratford,	52

WILLIAM SHAKESPEARE, the greatest of modern dramatists and first of English poets, was born at Stratford-on-Avon, Warwickshire, England, where his baptism was registered April 26, 1564. There, too, he died on April 23, 1616. The few facts of his outward life, which have come down to us, are mere fragments. Something, perhaps, there was of the idyllic in his early years, something of license in his youth and early manhood, something of worldly wisdom in his maturity; how much, relatively to other circumstances, we do not know. But it is certain that he was beloved for his genial and gentle disposition.

"Born at Stratford-on-Avon, married and had children there; went to London, where he commenced as an actor, and wrote poems and plays; returned to Stratford, made his will and died — this," says Steevens, "is all that is known, with any degree of certainty, about Shakespeare."

We should have cared very little about the birth and marriage, the will, or the death, of this native of a petty country town in the sixteenth century, but for the one other certainty, "he wrote poems and plays." That fact renders the minutest incident in the life of this son of a Warwickshire yeoman a matter of interest to the whole human race; for out of the cottage in which he was born, has gone forth a voice which is the mightiest in modern literature; and which, in connection with the higher teaching from above, is refining and humanizing wherever its sound is heard. Steevens was in a great degree right, as far as concerns a mere biographical notice of Shakespeare. His real biography lies in a critical estimate of his writings, as compared with others of his time, and in his relation to the age in which he flourished.

Shakespeare's birthplace was also the home of his youth. His father was an alderman of Stratford, by occupation a farmer, and in rank a gentleman, having received in 1569 a grant of arms from the Herald's college. His mother, Mary Arden, came of an ancient and honorable family in the county. The registers show that the father of the poet had five children who survived the period of infancy, and that William was the first son and the third child. There was a free grammar school at Stratford, and the probabilities are strong that here he received his education — English, something of Latin, and less of Greek. We have no trace how he was employed in the interval between his school days and manhood. Some hold that he was an attorney's clerk. The tradition is that he was a wild young fellow, stealing deer. The certainty is that he was treasuring up that store of knowledge, and cultivating that range of genius, which made him what he became.

At Shottery, a pretty village within a mile of Stratford, is an old farmhouse, now divided into several tenements, where dwelt a family by the name of Hathaway, and this property remained in the possession of their descendants. Anne Hathaway became the wife of William Shakespeare in 1582. The marriage bond and license are preserved in the consistorial court, at Worcester, England. By this marriage there were three children, Susanna, Hamnet, and Judith. Hamnet, the only son, died in his twelfth year. The two daughters survived their father, and inherited his property.

Some years after his marriage — 1586 — William Shakespeare became connected with the Blackfriars theater, in London. In 1589, when he was only twenty-five years of age, he was a joint proprietor of that theater, with four others below him in the list. The players of the Blackfriars were the lord chamberlain's company, those who acted under royal patronage. We know nothing of the date of the production of his first play.

Shakespeare became rich in connection with the theaters. He purchased the principal house in Stratford in 1597, and also some lands in that parish. It is supposed that he ceased to be connected with the theaters in 1609, for there is a valuation of his property in that year, for which he asked £1,433, 6s. 8d. His father died in 1601; and it is more than probable that the greatest of poets succeeded him as a practical farmer in his native place. He had his actions, at any rate, in the bailiff's court for corn sold and delivered.

His eldest daughter, in 1607, married Dr. Hall, a prominent physician residing in Stratford. Judith married Thomas Quiney, a tradesman in good circumstances, in February, 1616. The register of Stratford has another record two months afterward. On the 25th of April, William Shakespeare was buried in the parish church — the church of the Holy Trinity. Anne, his wife, survived until 1623. She was amply provided for by the laws of her country; for the greater part of Shakespeare's property was freehold, and the widow was entitled, for life, to the dower of one-third. The bequest to her of the second-best bed was one of affection, and not of neglect. The best bed was always an heirloom. The eldest daughter, Susanna, died in 1649. Judith died in 1662. Neither left any male heir. The one granddaughter of Shakespeare, Elizabeth Hall, inherited the bulk of his property. By her second marriage she became the wife of Sir John Barnard. In half a century the family estates were all scattered, and went to other owners, with the exception of the two houses in Henley street, which Lady Barnard devised to her kinsman, Thomas Hart, the grandson of Shakespeare's sister, Joan. These houses were purchased by the British nation in 1847 from the descendants of the Harts.

The twenty years between 1590 and 1610 were Shakespeare's harvest time. In the first decade came chiefly the histories and comedies; in the second, the tragedies. Some, or all, of them were performed before the royal court, as well as elsewhere. On several occasions his company appeared before Queen Elizabeth. In 1623, his stage companions, Heminge and Condell, having preserved affectionately all his plays (mostly in manuscript), gave them to the world in what is known as the *First Folio*. Prefixed was a half-length portrait engraved by Droeshout. This engraving, and the bust in the church, which was already in its place, are regarded as the most authentic likenesses of the poet. Such are the chief facts concerning the man about whom there have been written — not volumes, but libraries.

The evidence by which the chronology of

Shakespeare's works is inferred is of various kinds, including entries of publication in the stationers' registers, statements about the plays and poems or allusions to them, or quotations from them by contemporary writers, facts connected with the history of dramatic companies which presented plays of Shakespeare, allusions in the plays to historical events, and quotations by Shakespeare from publications of the day. There are not many instances of the mention of Shakespeare, during his life time, by writers of his period.

In 1593 appeared Shakespeare's first work, the narrative poem, *Venus and Adonis*, dedicated to the earl of Southampton, the poet's patron and friend. It is an elaborate piece of renaissance paganism, setting forth ideals of sensuous beauty in the person of the amorous goddess and of the young hunter, whose coldness meets and foils her passion. *Lucrece* followed in 1594, also dedicated to Southampton; in it the lawless passion of Tarquin is confronted by the ardent chastity of the Roman wife. Both the *Venus* and the *Lucrece* became immediately popular.

Shakespeare's earliest dramatic exercises consisted probably in adapting to the stage plays which had grown out of date. Many critics regard *Titus Andronicus* as an example of such work. Another of these plays is the *First Part of Henry VI. Love's Labour's Lost* (1590) is, perhaps, his first original play. Learned pedantry, fantastical extravagance of speech, the affections of amorous poetry, are satirized. *The Comedy of Errors* (1591), a lively tangle of farcical incidents, is founded on the *Menæchmi* of Plautus. *The Two Gentlemen of Verona* (1592), a romantic love comedy, exhibits a marked advance in the presentation of character. This group closes with *A Midsummer Night's Dream* (1593-94). No other comedy of Shakespeare's has so large a lyrical element. Meanwhile, Shakespeare was also engaged on the English historical drama. In the second and third parts of *Henry VI.* (1592) he worked upon the basis of old plays written probably by Marlowe and Greene. In *King Richard III.* (1593) he still writes in Marlowe's manner, though the play is wholly his own, his chief source for his historical material being Holinshed's *Chronicle*. The influence of Marlowe is no longer supreme in *King Richard II.* (1594), with which *King John* (1595) in style has something in common.

Romeo and Juliet is founded in the main upon a poem, *Romeus and Juliet* (1562), by Arthur Brooks, which versifies the tale taken by the French Boisteau from the Italian of Bandello; it has a lyrical sweetness, swiftness, and intensity such as we do not find elsewhere in its author's writings. Near to it in the chronological order probably stands *The Merchant of Venice* (1596), between the earliest comedies and those which lie around the year 1600. The advance in characterization from that of Shakespeare's previous comedies is remarkable. Shakespeare's mastery of comedy aids him in the historical plays which followed — the first and second parts of *King Henry IV.* (1597–98) and *King Henry V.* (1599). There is a tradition, dating from 1702, that Queen Elizabeth commanded Shakespeare to exhibit Falstaff in love, and that he hastily wrote *The Merry Wives of Windsor* (1598-99).

In *The Taming of the Shrew* (1597?), adapted and enlarged from an old play, *The Taming of a Shrew*, Shakespeare's genius shows itself chiefly in connection with the boisterous heroine, her high-spirited tamer, Petruchio, and the drunken tinker. The same animal spirits and intellectual vivacity appear — but now refined and exalted — in *Much Ado About Nothing* (1598-99). About this time he rehandled *Love's Labour's Lost. As You Like It* (1599), dramatized from a prose tale by Lodge, and *Twelfth Night* (1600-01) are the last of the wholly joyous comedies of this period.

After 1600 Shakespeare still wrote comedy, but the gaiety of the earlier comedies is gone. *All's Well that Ends Well* (1601-02) is least happy in its mirthful scenes. *Measure for Measure* (1603) hardly deserves the name of comedy; it is a searching of the mystery of self-deceit in the heart of a man and the exhibition of an ideal of virginal chastity. Perhaps it is to this date (1603) that *Troilus and Cressida* belongs, in which certain passages are probably by another hand than Shakespeare's.

Before he ceased for a time to write comedy, Shakespeare seems to have begun the next great series of tragedies. *Julius Cæsar* (1601) and *Hamlet* (1602) are tragedies in which reflection, as a motive power, holds its own with emotion. *Hamlet* is perhaps founded on an older play, which produced a great impression about 1588-89. Shakespeare doubtless read the story, originally derived from Saxo Grammaticus, in the English prose of the *Hystorie of Hamlet* translated from the French of Belleforest. And now tragedy succeeded tragedy, each of surpassing greatness. *Othello* (1604), founded on a tale in Cinthio's *Hecatommithi*, exhibits a free and noble nature taken in the toils of jealousy, and perishing in the struggle for deliverance. *King Lear* (1605), the story of which is derived from an old play on the same subject as well as from Holinshed's *Chronicle*, is the most stupendous tragedy in English literature. *Macbeth* (1606) is the tragedy of criminal ambition — the source again Holinshed. In *Antony and Cleopatra* (1607) Roman manhood is sapped by the sensual witchery of the East. From Plutarch also came the material for *Coriolanus* (1608). *Timon of Athens* (1607-08) is only in part by Shakespeare.

The last plays of Shakespeare are comedies; but they might be aptly named romances, for romantic beauty presides over them rather than mirth. *Pericles* (1608), or rather Shakespeare's part of that play, might better be named the romance of Marina, the lost daughter of Pericles. *Cymbeline* (1609) is also a tale of lost children at length recovered, and of a wife separated from her husband but finally reunited to him. *The Tempest* may have been written in 1610; it is believed that a German play by Jacob Ayrer and *The Tempest* must have had some common original. *The Winter's Tale* (1610-11) dramatizes a novel by Robert Greene. Apart from the other historical English plays, both in subject and in date, stands *King Henry VIII.* (1612-13). The play has been attributed in part to Fletcher. It lacks unity; but there is no lack of unity in the king, Wolsey, and Queen Katharine. Whether we have work by Shakespeare in another play partly written by Fletcher — *The Two Noble Kinsmen* — is more doubtful. In parts of *Edward III.* some critics believe that they can trace the handiwork of Shakespeare.

We have far less difficulty in getting at the truth as regards Shakespeare's intellectual and moral attributes than we have in tracing the events of his life or the chronological order of his works. His dramas and his poems furnish all the data necessary respecting his mental endowments. The peculiar quality of his mind has been expressed in three words — *a complete imagination*. His favorite books were those of Plutarch and Montaigne; his hero was Julius Cæsar; his aversion was the Puritan spirit; his greatest creation was Hamlet.

In reality, that which we think of, first and last, in connection with Shakespeare, is his creation of characters. Taine, in his "History of English Literature," groups them into five classes: brutes and idiots, like Caliban, Ajax, Cloten, Polonius, and the Nurse; people of wit, like Mercutio, Beatrice, Rosalind, Benedict, the Clown, and Falstaff; women, Desdemona, Juliet, Miranda, Imogen, Cordelia, Ophelia, Volumnia; villains, Iago, and Richard III.; characters of an excessive or diseased imagination, Lear, Othello, Cleopatra, Coriolanus, Macbeth, Hamlet. All these he finds united in their author. "Go through the groups," Taine says, "and you will only discern in them divers forms and divers states of the same power: here the flock of brutes, dotards, and gossips made up with a mechanical imagination; further on, the company of men of wit, animated by a gay and foolish imagination; elsewhere, the band of villains, hardened by unbridled passions, inspired by the artist's imagination; in the center, the mournful train of grand characters whose excited brain is filled with excited or criminal visions, and whom an inner destiny urges to murder, madness, or death." The whole, "an opera without music — a concert of melancholy and tender sentiment, which bears the mind into the supernatural world, and brings before the mind, on its fairy-wings, the genius which has created it."

A full appreciation of Shakespeare's extraordinary genius was not reached until the century just past. His place in the intellectual development of mankind was even less appreciated. He belonged to what has been called the modern transition — that general movement, which issued out of the decaying feudal society, and led confusedly toward a new era of literary art. It is to the world of art that Shakespeare belongs just as truly as to the world of intellect. For centuries before his time — particularly during the middle ages — whatever there was of art belonged to the feudal world, and its dominant notes were the church and chivalry.

These ideals created by these two forces were sacramental ceremonies, gracious manners, beauty of costume, and worship of women. Catholic worship filled the general imagination, and drew manifold beauty into its service. Book poetry was rare, but almost all art, and especially the arts of form which address the eye, became confessedly religious, and found their chief place in churches. There, but also freely in civic edifices and family dwellings, the artist habitually chose the revered Catholic subjects, and strove to set them forth with loyal and happy energy. His office, essentially a public one, was to glorify with human beauty, and especially beauty of expression, the divine and saintly benefactors, to claim their continued protection, and to represent their adversaries, outward or inward, as vanquished or struggling in vain, like the dragon with Michael's spear-point in his mouth.

Such art, therefore, however limited, was a priestly or parental presence in daily life. The blood of contending citizens might flow in the market place, but the grey church, built by their fathers, with its pleading figures of divine love, was looking down on them and reproving them. As mediæval cities still testify, architecture, sculpture, and painting, all freely given to the public eye, then occupied a far more constant and beloved place than in any modern experience. Religion was the general patroness, and art was the religious adorning of life. Yet it is plain that such religion and such art could not even then qualify the whole field of action, knowledge, or even feeling. Public amusement, for instance, such as the theater, had disappeared hand in hand with worship of the pagan gods, as intolerable in the eyes of the church.

At the beginning of the fourteenth century the system showed signs of giving way. The artistic mind gradually receded from religious themes, and, eagerly seeking secular subjects, treated them for their special attractions, often with surprising skill, but less and less with a moralized aim. Especially significant was the introduction of the nude into painting. At last, when the arts of form were in full-blown splendor, art and the church broke violently asunder. The systematic struggle evoked immense rebellious passion and patriotic ardor, and no less profound meditations and questionings. Architecture, sculpture, and painting, all secularized, were now in decline. Shakespeare was the luminous chief of a band of poets — poets of the secular drama — whose subject was man. His compositions stand out in human history as the first poetic work of the highest rank in which human interest is obviously and avowedly paramount. They do not pretend to be religious, and no religion claims or can claim them but the religion of humanity. His very calling — the stage — was in his time banned alike by Catholic order and by pious Puritanism.

In Shakespeare's own words his "Art made tongue-tied by authority" was forced to beg its bread of spiritual inferiors. Such conditions tried Shakespeare, but did not dismay him. If he had to be silent upon some very great things, on others he was free, and he might have his asides. If he had to please his Blackfriars audience, that he could do with pleasure, and even reverence. Could he not give them of his best, compel their laughter and tears and wonder, and set them all thinking — to their high delight and to his own, and — so time has proved — to the high delight of an ever-welcoming posterity? In choosing to write for the stage, then a new profession, this central figure of modern poetry was enabled to portray human nature in the most living and varied forms that language admits. He took the human soul to be his province, and made it both web and woof of art and worship, without rival and without disguise.

Shakespeare struck with new might and grander meaning the common chord of human fraternity. No poet has shown such a love of generalizing social and moral truths. These commonly appear as findings of mere human experience — not of revelation. Humanity, in fact, though imperfectly conceived, was the true object of Shakespeare's faith and love. The free temper of his work and many particular passages leave little doubt that he largely shared in the theological skepticism then so common behind the stage. Assuredly neither Catholic nor Puritan, he was perhaps not even at heart a Christian; his creed was undetermined. But he also bears interesting witness to deism, such as for centuries after in its uncertain way haunted the mind of thinkers and artists.

And so, now, by the voice of the whole civilized world, Shakespeare's name is the first in all literature; in imagination, in fancy, in knowledge of man, in wisdom, in wit, in humor, in pathos, in strength, in versatility, in felicity of language, in the music of his verse, and in that mysterious power which fuses all these separate powers into one, and makes them a single means to a single end, he stands unapproached, and seemingly unapproachable. His standard is that of a creative genius unique in literature.

JOHN MILTON, after Shakespeare the greatest English poet, was born in Bread street, Cheapside, London, on December 9, 1608 — ten years after the death of Spenser, and eight years before the death of Shakespeare. His life almost exactly coincides with the rise, development, and decline of the great outburst of English Puritanism, which followed the authorized version of the Bible in 1611.

Milton's father was a man of good family in Oxfordshire, had been educated at the university, and was disinherited for embracing Protestantism. He then became a scrivener, and acquired a competent fortune. The son's education, begun under a private tutor of Puritanical opinions, was continued from his fifteenth year at St. Paul's school, London. He has himself related that his love of letters was deeply rooted before he was twelve years old, and sedulously indulged in spite of headaches and weak eyes. He studied languages, both ancient and modern, delighted especially in poetical reading, and cultivated the musical taste which he inherited from his father.

In February, 1625, when he was a little over sixteen, Milton was admitted a pensioner at Christ's college, Cambridge. In the same year he wrote his ode, *On the Death of a Fair Infant,* and in his nineteenth year he produced the verses, *At a Vacation Exercise in College.* In the interval were composed several of those elegies, and other poems, which have gained for him the reputation of being one of the best among modern writers of Latin verse. The *Ode on the Nativity,* one of the noblest of all his works, and perhaps the finest lyric in the English language, was composed about December, 1629, when the poet was twenty-one years old.

The particulars of Milton's life at the university are imperfectly known. The tradition of his having been whipped is ill-vouched and improbable; but the fact would not seem to be irreconcilable with the ideas of academical discipline which were then prevalent. He does appear to have at first excited the displeasure of the authorities, probably for too free expression of opinions, and certainly for no serious moral offense; but he received his degree of bachelor of arts, 1629, in the regular course, and was pressed by the fellows of his college to remain at Cambridge. He could not resolve to comply with the wish of his parents that he should enter the church; and he declined also the profession of the law, for which, indeed, he had always a great contempt.

Mark Pattison, one of the poet's most noted biographers, has very aptly said that, "Milton's life is a drama in three acts. The first discovers him in the calm and peaceful retirement of Horton, of which *L'Allegro, Il Penseroso,* and *Lycidas* are the expression. In the second act he is breathing the foul and heated atmosphere of party passion and religious hate, generating the lurid fires which glare in his prose pamphlets. The three great poems, *Paradise Lost, Paradise Regained,* and *Samson Agonistes,* are the utterance of his final period of solitary and Prometheon grandeur, when, blind, destitute, friendless, he testified of righteousness, temperance, and judgment to come, alone before a fallen world."

It was in 1632, after leaving the university, that he went to the house of his father at Horton, in Buckinghamshire. In this retreat he lived from his twenty-fourth year to his twenty-ninth; a period which was not only very important in the development of his mind, but very fertile in the fruits of his genius. He read the Greek and Roman classics, bestowing particular attention on the historians; and, while his study of Spenser and Shakespeare, and their contemporaries, had probably begun in boyhood, there is, in his own poems of this stage, much to prove that he now became admiringly familiar, too, with Italian poetry. Not long after his retirement to the country, he produced the verses which he contributed to the masque of *Arcades.* His exquisite *Comus,* one of the masterpieces of English poetry, was acted in Ludlow castle at Michaelmas, 1634; and in

1637 was written the monody of *Lycidas*, a refined embodiment of classical fancies in the interwoven melodies of the Italian lyrists. *L'Allegro* and *Il Penseroso*, probably the most beautiful of all descriptive poems, likewise had their birth almost certainly in those "few years of calm and pleasing solitariness, fed with cheerful and confident thoughts."

Milton, in short, had already achieved immortal fame. The mantle of the Elizabethan poet had fallen on him; and, though his brilliant career had now been arrested, he would have been illustrious as the last survivor, and one of the most highly gifted, of that energetic and fruitful age. It is interesting to note how the dramatic turn which had been taken by poetry in the latter part of Elizabeth's reign still affected one whose greatness was to reach its climax in works modeled in another form, and breathing ideas of another cast. The most poetical kind of the old dramas was adopted and ennobled by him in the earliest of his sustained efforts. There is still extant, in his own handwriting, a memorandum of a hundred stories, from scriptural and British history, which had presented themselves to him as fit themes for tragedies, and the treatment of which, in several instances, he lays down in outlines. The same paper contains a plan, the most elaborate of all, for the working up into tragedy or mystery the incidents which, in the end, took an epic shape in *Paradise Lost.*

In 1638 Milton's father furnished him with the means of visiting the continent, where he remained fifteen months. He first spent a few days in Paris, and there made the acquaintance of Grotius, the celebrated founder of international law. He then passed two months at Florence, Italy, finding his way readily into literary society, to which, indeed, he recommended himself by the remarkable skill with which he composed Italian verses; and at Arcetri, near that beautiful city, he visited the illustrious Galileo. Two months more were spent in Rome; and, both there and in Tuscany, his classical predilections, and his sense of beauty in form, were richly nourished by the ruins and the scenery, the Greek sculptures, and the masterpieces of Italian painting. In Latin verses, about this time, addressed to Manso, the patron of Tasso, he hints at a design of celebrating, in an epic poem, King Arthur, the mythical hero of early British history. Naples, where Milton became acquainted with this accomplished person, was the farthest point of his travels.

He had intended to visit Sicily and Greece, but the news reached him of the outbreak of disturbances in England; and his zeal on public questions — which had already shown itself in Rome by somewhat rash talk on matters of religion — made him immediately resolve to retrace his steps. Returning to Rome, and crossing the Apennines to Bologna and Ferrara, he passed along Lombardy from Venice to Milan, and thence crossed the Alps to Geneva, where he remained a considerable time. He reached England about August, 1639, and took up his residence in London.

The next twenty years were the times of the civil war, the commonwealth, and the protectorate, in England. During this stormy and severe period the poet's lyre was mute. On political questions his views passed rapidly into republicanism; and his ecclesiastical opinions, adverse to episcopacy from his youth, were matured by the conflict around him, until he attached himself to the independents. Always deeply impressed with the importance of the great controversies of his time, and naturally far from being disinclined to discussion, he threw himself promptly and fearlessly into the vortex of the struggle. For a short time after his return from the continent, he occupied himself quietly in teaching his nephews, John and Edward Phillips, and other boys whom he received into his house.

Very soon, however, he began that career as a controversialist, which, while it has exposed him to much obloquy from those who dissent from his opinions, has enrolled his name among the noblest and most eloquent of the writers of Old English prose. His polemical writings are keen and sometimes abusive; but they are singularly able. His first work of this sort was a treatise, *Of Reformation*, published in 1641, to aid the attack then made on the English bishops.

He next engaged in the famous controversy, in which the five writers on the Puritanical side wrote under the name of "Smectymnuus." To this he contributed four successive treatises, measuring lances with bishops Gall and Usher. It is interesting to see the poet, in the heat of this fiery contest, looking back with regret on the time when he had lived "in the still and quiet air of delightful studies," and avowing his design of still executing, in his own proper sphere, some work worthy of immortality, some work nourished by observation and reading, and by "devout prayer to the Eternal Spirit, who can enrich with all utterance and all knowledge."

At Whitsuntide, in 1643, being then in his thirty-fifth year, Milton married Mary Powell, the daughter of an Oxfordshire squire, and a debtor of his father's. The courtship seems to have been short; and we know little as to the circumstances which, a few weeks after the marriage, led his wife to visit her father's house, and to refuse to return. Possibly it was the shock due to the sudden transfer of the poor girl from a jovial, cavalier country household to the apartments of an austere Puritan scholar. The husband was vehemently indignant, publicly disowned her, and proceeded to justify the step by the first of four treatises, in which he maintains the lawfulness of divorce for disobedience and other causes short of matrimonial unfaithfulness. The publication of these works is decidedly the most unpopular as well as the most discreditable step in Milton's controversial career.

Before the last two appeared, he gave forth, in 1644, his treatise, *Of Education*, expressing views, which, though tending to Utopianism, are very elevated in tone and couched in a strain of finely ornate eloquence. The same year gave to the public the grandest of his prose works, an appeal against all parties in behalf of the freedom of the press. It was entitled *Areopagitica: a Speech for the Liberty of Unlicensed Printing.* Soon after this his wife contrived to obtain an interview with him by surprise, and entreated his pardon. A reconciliation ensued. She lived with him without further separation, and the three daughters born to him were the fruits of this marriage. Her parents, also, being dispossessed of their house by the parliamentarians, were sheltered by him, and his interest with the ruling party was actively exerted to procure for his father-in-law a restoration of his estates.

In 1645 Milton published a collected edition of his poems, Latin and English, some of which, indeed, *Lycidas* being one, had not until now been acknowledged. Before this publication, Milton's sight had begun to fail. His left eye was almost blind in 1644, or very soon after. His strong feelings, however, made him, instead of sparing himself, enlarge his field of controversy; he passed from ecclesiastical to political questions. In February, 1649, a few weeks after the death of Charles I., he published a treatise, defending the latter's deposition and execution, entitled *The Tenure of Kings and Magistrates.* In March he accepted an appointment as secretary for foreign tongues to the council of state. The extant order-book of the council, and many letters also preserved, give evidence of his activity and usefulness in his office. By the desire of the council, too, though without receiving any payment, beyond his salary, he composed his *Eikonoklastes*, or "Image-breaker," an answer to the *Eikon Basilike*, or "Image of the King," which had been published as a work of the unfortunate king. This was followed by two books, written in Latin, being designed for circulation abroad: the "Defense of the People of England" and the "Second Defense." In 1652, before the latter of these works was completed, he had become totally blind. His first wife died in 1652, and the same fate befell his second wife, Catharine Woodcock, within a year after her marriage, which took place in 1656. To the memory of the latter he dedicated a fine sonnet. His blindness, though it incapacitated him for regular official business, left him able to perform important public duties. In 1655 he drew up the manifesto of Cromwell, then protector, in justification of the war with Spain, and several controversial treatises came from his pen in the last years of the protectorate.

To his literary employments he now returned with redoubled ardor. Some progress was probably made with his *History of England*, of which four books had been written before his appointment to the secretaryship; he collected much material — which was used by Cambridge scholars in 1693 — for a Latin dictionary, in amendment of the *Thesaurus* of Stephens; and there is good reason for believing that, during this period of honored repose, he made considerable progress in the composition of his great epic.

The restoration of 1660 consigned Milton, for the last fourteen years of his life, to an obscurity which, wearing no terrors for his firm soul, gave him full leisure to execute the mighty poetical task he had undertaken. At first he thought it necessary to conceal himself. His friends are said to have made a mock funeral for him; and a proclamation was actually issued for his apprehension and that of Goodwin, the theologian. The most offensive of his books were burned and he was placed under arrest, though soon afterward released; it was even asserted that his former office was offered to him, but, of course, refused. He had in the end inherited but little from his father, had failed in getting the inheritance of his first wife, had lost money loaned, and accidently his house was burned. Accordingly, his circumstances were now indifferent, yet not very low for a man so moderate in his habits.

Paradise Lost was dictated to his daughters, and other amanuenses, and completed about 1665. A sale of thirteen hundred copies within two years seems to show that Milton's claim to a place among the great poets was admitted from the first. This was a large sale for a serious poem in an age like that of the restoration; and, though it could not meet with applause from the fashionable debauchees of the court, the hearty and respectful admiration of Dryden was not the only tribute that was immediately paid, by competent judges, to the extraordinary merit of the only great epic in the English language. Before its publication, the poet's daughters were very impatient at their heavy task as his readers and amanuenses; and the history of his household is one of sordid sadness up to his marriage, in 1663, with Elizabeth Minshull, his third wife. She restored comfort to his house, but failed to conciliate his daughters, who "learned embroidery, left home, and set up for themselves."

The poet next published his *History of England*, down to the Norman conquest; and in 1671 appeared his *Paradise Regained*, to which was subjoined *Samson Agonistes*. His second epic was written with great celerity, perhaps altogether during his retirement of several months at Chalfont, in Buckinghamshire, on the breaking out of the plague in London in 1665.

His literary labors closed with a "Treatise on Logic," very ably written in Latin; a new treatise in controversial theology, *Of True Religion*, directed against the papacy; and a Latin collection of his private letters and academical exercises, published in 1674. To the latest years of his life may have belonged the completion of his Latin treatise, "Of Christian Doctrine," which, left unpublished until it was disinterred from the state papers in 1823, showed him to have become strongly attached to Arianism.

In July, 1674, having long been distressed by gout, and thinking himself near death, he gave his brother directions as to the disposal of his property. These throw some light on his domestic relations. The facts exhibit traces of those infirmities of temper with which the great poet is traditionally charged. They intimated his intention (which his widow unsuccessfully attempted to establish as a completed will) of bequeathing all his property to his wife, leaving to his daughters only, besides what he "had done for them," a claim on their mother's family for her portion still unpaid. He spoke of them as his "unkind children," and said they had been "very undutiful to him." On Sunday, November 8, 1674, he died so calmly that the moment was not perceived, and was buried beside his father in the chancel of St. Giles, in Cripplegate, London.

Milton was not connected with any church, but appears to have favored the independents — a politico-religious party. "He grew old without any visible worship," says Johnson, who also adds that "his studies and meditations were an habitual prayer." His favorite authors among the Greeks were Homer and Euripides, and Shakespeare and Spenser among the English.

His stature was rather below the middle height, and in his youth he was so eminently and delicately beautiful as to be called "the lady" of his college, though his habits were far from effeminate. He had a fair complexion and auburn hair. In his later years he was stately and reserved.

Amidst evil men and evil days Milton discharged the debt which, he proudly asserted, he held himself to owe to posterity. He has enriched the world of poetry with a host of its noblest images and sentiments. His three chief lyrics — *L'Allegro, Il Penseroso,* and *Lycidas* — have almost every quality of poetry in literal perfection. No other five hundred lines in English, perhaps, soar to so lofty and faultless a level, without a jarring note or a feeble phrase.

The *Paradise Lost* has music and conceptions even more sustained and enthralling, such as Shakespeare, Dante, and Homer alone can match. It is evident, however, that the epic has not the incomparable perfection of the lyrics. There are in it incongruities, vagueness, monotony, limitations of human types, which are never felt in the presence of the three supreme masters, and seldom even in Vergil, Ariosto, Calderon, or Goethe. It is plain that Puritanism and an abortive revolution forced this consummate poet to turn away both from past and present, and to search for the subject and scheme of his epic in his own meditations on the Hebrew Bible. He treated this with extreme freedom, and not without a disputatious dogmatism; but even Milton could not shake himself free from its obsolete theology and its barren cosmogony. That a great poet, under such conditions and in such an age, should have done so much with the Hebrew pentateuch as his inspiration is one of the noblest triumphs of human genius.

At the same time, this great citizen and heroic soul, being forced back upon his own heart for his ideal of man in the presence of nature and its Creator, produced from the depths of his pure and rich imagination a marvelous picture of humanity in all its naked essentials, before history had loaded its memories, or civilization had clothed its life with conventions. The aim of Milton is thus analogous to that of Dante; and, in simple majesty and unity of scheme, for a time it seems even superior. But the rigid limits of scripture and inevitable want of varied human interest compel us to admit that the close of *Paradise Lost* is hardly equal to its sublime exordium and the earlier acts in the great drama of man's creation, fall, and salvation. Yet the originality, power, and eternal meaning of Milton's poem gain fresh significance as civilization advances; and we see that since the work of Dante there has been no such approach to the ideal epic of humanity.

Like Dante, like Homer, Milton has given us a *living*, and not a *literary*, epic. It is Dante among the moderns, and Vergil among the ancients, whom, in sustained moral purpose and in religious consciousness of being the inspired voice of his age, Milton most nearly resembles. He also resembles these in lifelong dedication to his task as the prophet of a social regeneration to be. It is to the lasting glory of English Puritanism that it could join in one work such a creative statesman as Cromwell with so supreme a poet as Milton.

"It may be doubted," says Landor, "whether the Creator ever created another altogether as great as Milton — taking into one view his manly virtues, his superhuman genius, his zeal for truth, for true piety, true freedom, his eloquence in displaying it, his contempt of personal power, his glory and exultation in his country's."

MOLIÈRE

1673	*Le Malade Imaginaire*, "The Imaginary Invalid"; died at Paris, . .	51

MOLIÈRE is the stage name of Jean Baptiste Poquelin, greatest of French comic dramatists. The date of Molière's birth and many circumstances of his life rest upon imperfect authority. Accounts of his life, therefore, differ in many details. The more probable facts are herein adhered to.

Molière was born in Paris, January, 1622, son of Jean Poquelin, a well-to-do upholsterer, who ultimately held an appointment in the royal household. His father intended him for the same trade and gave him a suitable training for it; but having been early imbued by his grandfather with a passion for the stage, the young Poquelin entered, at fourteen, the famous Jesuit college at Clermont. Here his fellow pupils were the prince of Conti and other well-known men. He studied philosophy under the famous Gassendi, and his progress was unusually rapid and honorable. He admired much and commenced a translation of Lucretius, a fragment of which is found in his *Le Misanthrope*. He then studied law, and, it is said, became an advocate.

His father becoming infirm, he was compelled to pursue the family trade in the household of Louis XIII., whom he followed in his journey to Narbonne in 1642. The French theater was then beginning to emerge from barbarism and neglect, and to flourish under the great and fostering talents of Corneille, and the patronage of Cardinal Richelieu. Poquelin, destined to become among the French the founder of true legitimate comedy, no longer dissembled his decided preference for the stage. He quitted his employment, and joined a society of young men like himself devoted to theatrical pursuits. It was then that he assumed the surname of Molière, either from regard for his family, or in compliance with a custom which generally prevailed among the actors.

From 1645 Molière's history is lost amidst the wars of the Fronde; but he appears to have wandered in the provinces with his troops, and to have composed slight pieces for them until 1653, when his first regular comedy *L'Étourdi*, "The Giddy-Head," was played at Lyons with great success. The genuine wit of the dialogue, the inexhaustible address of the valet in repairing the blunders of his master, and the interest occasioned by this perpetual contrast, procured the piece considerable success, notwithstanding its numerous defects. In Languedoc, next year, he produced *Le Dépit Amoureux*, "The Loving Spite," and, bent on his favorite pursuits, refused to become the secretary of his old school fellow, Prince de Conti.

In 1658 Molière and his company, finding their way to Paris, received the patronage of the court. He was by this time an actor of reputation. He immediately showed that he possessed both power of observation and of original invention, and a skill in dramatic construction, much exceeding anything that had appeared in his earlier pieces. He was received in Paris with favor by the king, who permitted the company of Molière to call themselves the "king's comedians," and bestowed on their leader a pension of one thousand livres. There, during the remaining fifteen years of his life, he labored incessantly as player and dramatist. His first great success, and that which revealed his genius to the public, was *Les Précieuses Ridicules*, "The Affected Ladies," produced in 1659. Molière played Mascarile, the impudent valet, a name that came often to be applied to himself.

In this original and delightful piece, Molière marked out his own peculiar fort — the satiric comedy of modern manners. He proceeded to point out, analyze, and judge a prevalent type of conduct, bringing it before the judgment seat of good sense and right feeling. At that period people had been accustomed only to plays of the most immoral or insignificant tendency, debased by portraitures of low and improbable intrigues. The art of exhibiting on the national stage characters and manners taken from real life was reserved for the talents of Molière. *Les Précieuses Ridicules* had great simplicity and truth of design. It was a keen and delicate satire on the rage for the *bel esprit*, which then prevailed; on the stiff and bombastic diction of the romances in vogue; the ridiculous pedantry among the women, and the affectation universally observable in their language, their sentiments, and their dress. When represented at Paris, it induced a gradual and general alteration of manners. The spectators laughed at their former follies, and while they applauded the author, reformed themselves.

After the marked success of *Les Précieuses Ridicules*, Molière took up his residence at the Palais Royal in 1660. He is said to have remarked that henceforth he had no need to go to Plautus, Terence, and Meñander for types of character: he had only to study the world before him. He fell back infrequently, however, to please the groundlings, on farces in the Plautan and Italian manner; he wrote ballads and extravaganzas for the court; and he failed in heroic comedy. But these were mere interludes in his career; yet no year passed without at least one of the greatest creations in their own line that the world has seen. Altogether we have nearly thirty of his plays, still extant, produced in the midst of incessant labor as an actor, manager, and court functionary, with intervals of acute domestic troubles, and furious professional intrigues.

His *L'Ecole des Maris*, "The School for Husbands," taken from the *Adelphi* of Terence, but very superior to the original, came out in 1661. It presents a comedy of manners, character, and intrigue developed with art, and great simplicity. While the theater yet resounded with the applause which it so justly merited, *Les Fâcheux*, "The Bores," a piece conceived, written, studied, and represented in the space of a fortnight, was played at Vaux, a house belonging to Fouquet, the celebrated superintendent of the finances, in the presence of the king and court. The scenes of this little comedy are by no means sufficiently connected; but the attention of the spectator is kept alive by the variety in the characters, the spirit of its dialogue, and the elegance of its language. This was followed the next year by *L'École des Femmes,* "The School for Wives." Some crudity in the style excited the censure of the critics, and they overlooked the exquisite art which prevails throughout the inimitable character of Agnes, and the rapid and natural succession of incidents. Molière replied to this decision by an ingenious critique on his own performance, and completely refuted the unjust cavils it had occasioned.

In 1666 Molière produced *Le Misanthrope,* "The Misanthrope," one of his masterpieces. This admirable play was little applauded at first, through ignorance or envy, but is now considered one of the first either in the ancient or modern drama. It must be admitted, however, that it is more generally admired in the closet than on the stage. The satire is conceded to be more keen and delicate than that of Horace, or Boileau; but as a comedy it has less interest than *Le Tartufe,* "The Hypocrite," produced in 1667. The latter is generally considered the greatest effort of his genius, and presents pictures of hypocrisy that have never been equaled. *L'Avare,* "The Miser," which appeared in 1668, was admirably calculated for the amusement of the lower orders, who require satire to be bold and strongly marked. *Le Bourgeois Gentilhomme,* or "The Simple Gentleman" (1670), and *Les Fourberies de Scapin,* "The Cheats of Scapin," are of the same class — extremely diverting, but coarsely drawn.

Molière gave himself more time in the composition of *Les Femmes Savantes,* "The Learned Ladies," in which he ingeniously satirized the ridiculous affectation and pedantic erudition of the Hôtel de Rambouillet. The scene of Trissotin and Vadius was taken from a real dispute which occurred between Cotin and Ménage. *Le Malade Imaginaire,* "The Imaginary Invalid" (1673), is a play of a different description; but it exposes, with the usual sagacity and ingenuity of Molière, the pedantry and quackery of the medical profession of the time. It will be chiefly remembered, however, as the last production of this illustrious man, during the representation of which he was seized with illness of which he died.

He had been indisposed for some time; and his friends in vain exhorted him to repose himself. "But what," said he, "will become of so many poor workmen? I should forever reproach myself for having missed one day in procuring them bread!" The exertions he made while himself performing in *Le Malade Imaginaire* over-powered him, and a convulsion seized him on the stage. It was remarked that as he pronounced the word *juro,* his countenance changed, and the blood immediately began flowing from his mouth. The play was stopped. He was carried home, and died that night in his home in the Rue Richelieu, February, 1673, having lately completed his fifty-first year.

The archbishop of Paris at first refused to permit his body to be interred in consecrated ground — an illiberal and unjust prejudice against comedians, which continued to prevail centuries afterward. The wife of Molière exclaimed, "They refuse a tomb to a man to whom all Greece would have erected altars!" The king, at length, interfered, and desired the prelate to retract his prohibition, and the body was interred in the church of St. Joseph — and ultimately to Père la Chaise, where his dust is now supposed to rest.

As an actor, though respectable, his talents were not so conspicuous as in his writings. Personally, we are told that Molière was of fine and graceful figure; with a serious air, large mouth, thick lips, and heavy nose, large and marked eyebrows, dark complexion — and with wonderful expression as a comic actor. In society he spoke little; he was punctual in all his habits; an indefatigable worker and a most rapid composer. In all his public relations his conduct was honorable and manly. His loyalty and devotion to his professional comrades for a period of nearly thirty years were interrupted only by his death. His friendship with Corneille, Racine, and Boileau was, on his part, at least, sincere and generous; and his country house at Anteuil was the resort of all the wits of his age. The Marechal de Vivonne lived with him in all that intimacy which places genius and talents on a level with affluence and rank. The great Condé often solicited his companionship; and would acknowledge that from his conversation he always derived something new.

His merit as a writer was universally allowed by the men of genius of all classes who adorned that fertile age. When Louis XIV.

once asked Racine whom he conceived to be the first of the authors who had illustrated his reign, he instantly replied, Molière. "I should not have thought so," said the king, "but you are a better judge than I am." So many marks of distinction corrupted neither his heart nor his mind — he was mild, compassionate, and generous.

Louis XIV. remained his firm patron throughout, and ultimately supported Molière in his long struggle against the priest party, to obtain the representation of *Le Tartufe.* Louis made Molière his *valet de chambre* and admitted him to his privacy: the anecdote that the king, to give a lesson to his courtiers, once made the actor sit down and partake of his bedside supper, is not improbable; and it is certain that he stood godfather to Molière's first child.

Molière, although he contributed so largely to the amusement of others, was himself the sport and prey of domestic misfortune and misery. In 1662 he had married Armande Béjart, he being forty and his wife eighteen. She was the daughter of his old love, Madeleine Béjart, a provincial actress, through a private marriage with M. de Modene, a gentleman of Avignon. The disparity of their ages subjected him to ridicule, and gave him fits of jealousy, which were by no means without cause. No sooner had she become his wife than she displayed all the extravagance and caprice of a coquette. The miserable husband lectured, implored, and railed in vain; parted from his giddy wife in wrath; and at last returned to her. She bore him two children, one of whom, a daughter, survived his death. If his pen, in describing the errors and frailties of the sex, had such a glow of nature and truth, it was probably because a living model of vexation was in his own house.

After his death his widow shortly married an obscure comedian named Le Grand. She retained no respect for the memory of her illustrious husband, and was so careless of his manuscripts that none of them have been preserved. This culpable indifference extended even to a daughter who was the fruit of this inauspicious union; and who, neglected by her parent, eloped from her at a very early age, and lived and died in obscurity.

In pure comedy, Molière has no superior, not even Aristophanes. He is marked out, above all the masters of this art, by the wonderfully systematic and profound study that he devoted to every type of folly, affectation, hypocrisy, quackery, foppery, and grossness which beset his age. In the sphere of contemporary manners, he is the zealous *censor morum*, almost as much the moralist as he is the artist. No poet — not Wordsworth, nor even Dante himself — ever worked more consciously with a purpose, as a moral teacher and judge of his contemporaries. But the astonishing quality of Molière's genius is that the purpose never obtrudes itself, never overmasters the poet, or ends in tedium and commonplace. On the contrary, some of Molière's happiest lessons in simplicity and manliness are worked out in wild burlesques and riotous outbursts of quite familiar farce. In this he has been approached among modern writers only by Fielding. But in the exquisitely finished verses of *Les Femmes Savantes*, the same spirit is at work in all the conventional manners of polished society and modern social culture.

In his masterpiece, *Le Tartufe*, he boldly grappled with one of the deepest problems of modern civilization, and the world-wide popularity of this great piece is a proof of his power in the most difficult sphere of social ethics. *Le Misanthrope*, though inferior as a play, is more subtle and profound as a study. It has earned the criticism that it is rather tragic than comic in conception. There can be little doubt that Molière has painted in *Alceste* not a little of his own noble yearnings and profound weariness, as of a free spirit born out of time into a most artificial and degenerate society. It is objected, and with some truth, that Molière is hardly to be classed as a poet, inasmuch as his characters are too typically intense to be individuals, because his portraiture is so sharply cut, and his conceptions entirely without mystery and beauty. It is true that neither in *Psyche*, nor in any of the lyric interludes has he ever shown a trace of the fantastic imagery or exquisite music of Shakespeare, nor again of the phantasmagoric fairyland of Aristophanes. Nor does the dialogue of Molière sparkle with wit and fancy as do those of some English and some Greek comedies.

Molière is always the Frenchman, and the Frenchman of the age of Louis XIV. He is always so measured in his forms as to be something of the comic Racine; his wildest humor is courtly, as of some Rabelais of Versailles. His buffoonery melts into graceful comedy; his polished dialogue is easily extended into practical fun. It is this peculiar gift which places him alone. He has created scores of immortal types of human character. They are not oddities and individualities, but classes of civilized men and women. And if he has never broken into Pindaric heights of fancy, or given us scenes of pathos, beauty, and mystery, he is one of the profoundest masters of human nature, and one of the most original minds in creative art.

Critics compare Molière with Shakespeare, and find them not unlike in position, character, and qualities. No modern poet equals these two in knowledge of men and motives. On the other hand, he is compared with Dante; and here is found a contrast, yet an analogy. Dante is the artistic representative of tradition and dogma; Molière is the artistic representative of something which is opposite. He has seized everywhere the features which serve to form a complete picture of human life.

To know him is to hate hypocrisy, fanaticism, and intolerance, and recognize pedantry and false wit at a glance; to be above the deception of fine-drawn expressions and the painted graces of an artificial style. Hypocrisy he especially detested, and lashed it without mercy in all its varied forms, wherever he found it. It is to Molière, more, perhaps, than to any other writer, that the French language owed its tendency to run into apt sayings — the small change of conversation — which has made it the favorite language of polite society and immortalized it as the language of epigram.

MONTESQUIEU

A. D.		AGE	A. D.		AGE
1689	Born at Château de la Brède, France,	..	1728	Received at French academy,	39
1714	Councilor of the Bordeaux parliament,	25	1729–31	Visited England; elected F. R. S.,	40–42
1715	Married,	26	1734	*Considérations sur les Causes de la Grandeur des Romains*, etc.,	45
1716	President Bordeaux parliament,	27	1748	*Esprit des Lois*, "Spirit of Laws,"	59
1721	*Lettres Persanes*, "Persian Letters,"	32	1755	Died at Paris,	66

MONTESQUIEU, or CHARLES DE SECONDAT, baron of Brède and Montesquieu, the celebrated French writer, was born of a noble family at the Château de la Brède, near Bordeaux, France, January 18, 1689. It was at the crisis of the English revolution. France was suffering from the revocation of the edict of Nantes, effected four years earlier; and five years later Voltaire, and with him potentially a whole new world, was born.

The young noble's great abilities were early apparent, and in his youth he devoted himself passionately to study, efficiently aided by his father. Destined for the profession of law, he accumulated a large mass of extracts from the civil law, which proved to be the first part of his preparation for his great work. He began at the same time to think for himself on some deep and difficult subjects; and at the age of twenty wrote a tract to show that the idolatry of the heathen — he already loved Socrates and Plato, Plutarch and Seneca — did not deserve eternal punishment. From prudential motives this piece was either not published or quickly suppressed.

In 1714 he became a judge in the parliament of Bordeaux, the very court in which a century and a half before Montaigne had held the same office, and in the year following he married Mademoiselle de Lartigues. In 1716 he succeeded his uncle as president. He was an efficient officer, but by preference he devoted himself to certain branches of physical science which at this time was particularly engaging to him — a further step in his necessary culture and training.

In 1721 he astonished his countrymen with a small book entitled *Lettres Persanes*, "Persian Letters," in which, under the guise of a traveled Persian and a mask of mirth, he satirized their follies and vices, their levity, vanity, extravagance, and quarrelsomeness, hitting hard and sparing no one. For the sake of contrast, he held up the example of England, under the guise of a virtuous race of Troglodytes. The book appeared anonymously, but its authorship was not long concealed. Its success was immense. Montesquieu himself records that publishers, eager for other like profitable surprises, would catch hold of authors as they passed, and beg them to write some more "Persian Letters." This sparkling work was translated into English by Ozell in 1730. Its method was adopted by Goldsmith in his *Letters from a Citizen of the World.*

Montesquieu did not relish the law as a profession, his thought moving in a wider sphere. "After leaving college," he says, "they gave me law books, but I was in search of the spirit." Having held his judicial office for ten years, he sold it and retired. In the following year he was candidate for a seat in the French academy; but Cardinal Fleury, then first minister, told him that the king, Louis XV., would never consent to the admission of the writer of the "Persian Letters." Determined not to let slip the honor of election, he altered — so states Voltaire — the offensive passages in the "Letters," had a new edition rapidly printed, and himself presented a copy to the minister, who then took the trouble to read it. The way was now opened, and in January, 1728, Montesquieu was received as one of the forty immortals.

For the enlargement of his knowledge he now spent the years 1729–31 in foreign travel, visiting first the imperial court, then Hungary, Italy, Switzerland, Germany, Holland, and England. At Vienna he met Prince Eugene; at Venice, the notorious Law, projector of the Mississippi scheme; and at Rome he associated with Cardinal Polignac. Accompanying Lord Chesterfield to England, he was presented to Queen Caroline, who delighted in the society of the wise and learned, and was the friend of Butler and Berkeley. He made the acquaintance also of many other eminent men, and was chosen a fellow of the royal society of England. His travels were followed by a studious retirement of two years; and he then, in 1734, gave to the world his important work, *Considérations sur les Causes de la Grandeur des Romains et de leur Decadence*, "Considerations on the Causes of the Grandeur and Decadence of the Romans."

Henceforth he devoted himself to the preparation of the great work upon which he had long meditated, and to the composition of which he gave fourteen years. Like Milton, he was in no hurry to publish, but was content to wait the slow furnishing of his mind and the ripening of his faculties. After entering upon his task, the growing sense of its vastness almost paralyzed him, and he several times dropped and resumed it.

When he had at length completed it, he sought the opinion of his friend Helvetius. This opinion was unfavorable; and Helvetius, supported by another friend, Saurin, strongly advised the author not to publish it. It would, he said, be the ruin of his reputation. He did not, however, alter a word; and in 1748 the *Esprit des Lois*, "Spirit of Laws," appeared in two quarto volumes, printed at Geneva. It found an audience immediately, ran through twenty-two editions within eighteen months, and was translated into all the languages of Europe.

The purpose of the *Esprit des Lois* was not to set forth what governments ought to be; but to find in nature and in history the explanation of existing maxims and institutions of various nations; to show how diversities in physical and moral circumstances have contributed to produce diversities in government and municipal institutions. Its special interest is in its exposition of relations between sets of phenomena apparently unrelated to each other.

The largeness of his conception of law appears in the opening chapters, in which the connection between natural law and human law is distinctly stated. "Laws," he begins, "are the necessary relations following from the nature of things." More explicitly he states afterward: "Between two bodies in movement, the relations of mass and velocity determine the increase or diminution of movement; throughout every variation there is uniformity and constancy. Similar relations are to be found in human affairs. Before the beginning of positive law, there are natural relations of justice to be sought."

To find these fixed conditions was Montesquieu's object. Some were dependent on the form of government; others on the play of passions to which each form, republican, aristocratic, monarchic, or despotic, was specially favorable. His work is divided into thirty-one books. The first eight deal with the various forms of government, the principles of action in each, and the mode in which each underwent corruption and decay. In a republic he considered that virtue was the principle of stability; in a monarchy, honor; in despotism, fear. The ninth and tenth books discuss war, defensive and offensive. In the eleventh, twelfth, and thirteenth books, the conditions of political liberty are explained, and their connection with taxation. In the four following books, Montesquieu passes to the subject of climate as affecting national character, and its bearing on the institution of slavery. Fertility or sterility of soil as affecting civilization is the subject of the eighteenth book. The nineteenth deals with the bearing of national character on law. The twentieth, twenty-first, and twenty-second discuss the relations of law and commerce. In the twenty-third, population is considered; in the three following books, religion; in the twenty-seventh, inheritance. The work concludes with an historical review of the growth of French legislation from its feudal origin.

The observations of fact contained in this comprehensive sociological treatise are numerous and carefully made. The conception of a social organism held together by interdependent forces, and dependent on external conditions, was more systematically put forward than in any work which had appeared since the *Politics* of Aristotle. Montesquieu's conception of biological science was too imperfect, and the possibility of arriving at definite laws of social progress was, as yet, too remote to give his work more than transitory value; but he is to be regarded as one of the principal forerunners of the science of sociology.

Many hostile attacks were made on the *Esprit des Lois;* but only one of these, involving a charge of atheism, provoked any reply. The author published a *Defense de l'Esprit des Lois,* "Defense of the Spirit of Laws"; and the Sorbonne, which had a sharp eye on the original work, refrained from the condemnation which it was about to issue. The influence of the *Esprit des Lois* is believed to have been more powerful in Great Britain than in France. It is distinctly traceable in Adam Smith's epoch-making work, the *Wealth of Nations,* which appeared about thirty years later, and otherwise affected the highest contemporary political thought of the times.

Referring to the *Wealth of Nations*, Gibbon remarked: "The strong ray of philosophic light on this subject which broke over Scotland in our times was but a reflection, though with a far steadier and more concentrated force, from the scattered but brilliant sparks kindled by the genius of Montesquieu." Mackintosh, in his *Discourse on the Study of the Law of Nature and Nations,* pronounces a noble eulogy on the book, and says that he never names the author without reverence. It was a favorite handbook of the lovers of "regulated liberty," as distinguished from the fanatics of the revolution. Voltaire, though no friendly critic, recognized its literary quality, and said: "The human race had lost its titles; Montesquieu found and restored them."

The sudden blaze of reputation did not turn the head of so sober and wise a man as Montesquieu. But he enjoyed his triumph rather at La Brède than at Paris. He was becoming an old man, and, unlike Fontenelle, he does not seem to have preserved in old age the passion for society which had marked his youth. A rather dubious description, published long after his death, represents him as "wandering in his woods from morn to night with a white cotton nightcap on his head, and a vine prop on his shoulder."

This, in the florid language of its time — republican period — is, probably, only an imaginative expression of his known interest in managing his estate. But he certainly spent much of his later years in the country, though he sometimes visited Paris, and on one visit had the opportunity, which he is likely to have enjoyed, of procuring the release of his admirer, La Beaumelle, from an imprisonment which La Beaumelle had suffered at the instance of Voltaire. He is said also to have been instrumental in obtaining a pension for Piron, the famous epigrammatist. Indeed, indigent or unlucky men of letters found in him a constant protector, and that not merely at the royal expense.

Nor did he by any means neglect literary composition. The curious little romance of *Arsace et Ismenie,* a short and unfinished treatise on taste, many of his published *Pensées,* or "Thoughts," and much unpublished matter date from the period subsequent to the *Esprit des Lois.* He did not, however, live many years after the appearance of his great work. At the end of 1754 he visited Paris, with the intention of getting rid of the lease of his house there and finally retiring to La Brède. He was shortly after taken ill with an attack of fever, which seems to have affected the lungs, and in less than a fortnight he died, on February 10, 1755, aged sixty-six. He was buried in the church of Saint Sulpice with little pomp, and the revolution obliterated all trace of his remains.

The death of Montesquieu was considered a general calamity, and excited the regret of other countries as well as his own. "His virtues," said Lord Chesterfield, in announcing his death in Great Britain, "did honor to human nature, his writings to justice. A friend to all mankind, he asserted their undoubted and unalienable rights with freedom, even among his own countrymen, whose prejudices, in matters of religion and government, he had long lamented, and endeavored, not without some success, to remove. He well knew and justly admired the happy constitution of this country, where fixed and known laws equally restrain monarchy from tyranny and freedom from licentiousness. His works will illustrate his name, and survive him as long as right reason, moral obligation, and the true spirit of laws shall be understood, respected, and maintained."

It is on his three principal works that his fame rests — the *Considérations*, the *Lettres Persanes*, and the *Esprit*. It is doubtful whether the *Lettres Persanes* yield at their best either in wit or in giving lively pictures of the times to the best of Voltaire's similar work, though they are more unequal. The *Considérations* are noteworthy not only for a complete change of style, but for the profundity and originality of the views, and for the completeness with which the author carries out his plan. The real importance of the *Esprit des Lois* is that it is an assemblage of the most fertile, original, and inspiring views on legal and political subjects, put in language of singular suggestiveness and vigor. Nor is it less notable for its spirit of temperate and tolerant desire for human improvement and happiness. It has little ornament of style, but its composition is wholly admirable, and the author's wit is freely used to lighten its pages. The genius of the author for generalization is so great, his instinct in political science so sure, that even the falsity of his premises at times fails to vitiate his conclusions.

Montesquieu was an insatiable reader, and declared that he never felt a sorrow which an hour's reading would not dissipate or relieve. His habits of intense application, however, seriously threatened his sight, and at death he was totally blind. Though subject to frequent absence of mind, he was lively and cheerful in society, and his conversation, abounding in wit and keenness of remark, was not inferior to his writings. His expenses were regulated by a wise economy, a certain portion of his income being always reserved for charity, and the numerous acts of benevolence which his death alone revealed.

An anecdote which is related of him has been made the subject of a drama, under the title of *Le Bienfait Anonyme*, "The Nameless Benefactor." Montesquieu, when at Marseilles and sailing round the port in a boat, was struck with the melancholy air of the man who conducted him. Inquiring into the cause of so much dejection, the boatman informed him that his father had been taken by pirates, confined in Algiers, and that he was then struggling to gain money sufficient to ransom him. On the same day, to the inexpressible astonishment of the young boatman, the money that was required for his pious purpose was paid into his hands by persons unknown to him. He made many useless attempts to find out the name of his benefactor; but it was not discovered until after the death of Montesquieu, when the inspection of a paper proved him to be the beneficent doner.

The unaffected modesty of this illustrious man would not permit any painting or bust to be taken of him. His aversion to any such exhibition of himself was long insurmountable. At length Dassier, a celebrated medalist, went from London to Paris to endeavor to procure a likeness of the great author of the *Esprit des Lois*. Montesquieu, unwilling to spare the necessary time for the purpose, constantly resisted the pressing solicitations of the artists, until Dassier, after employing many arguments in vain, said to him, "Do you not think that there is greater vanity in refusing my request than there would be in acceding to it?" This shrewd question disarmed the sage, and he submitted to the demands of the artist.

Montesquieu's favorite writers were Plutarch and, above all, Tacitus, between whom and himself there was a singular coincidence of style — the same energy, precision, and sometimes obscurity of diction. Of Tacitus, Montesquieu was accustomed to say, "He abridged everything, because he saw everything"; and by thus describing the genius of Tacitus, he has exactly defined his own.

The eighteenth century — that of Montesquieu — has often been disparaged by writers as to its character, products, and tendencies. It is true that it has given us no *Hamlet* or *Lear;* no *Paradise Lost*, nor any works of creative imagination to rank with or near these. But one fact is clear: it has left the world the richer by some noble monumental works of human intellect. Its labors were mostly in the region of facts, and its chief literary monuments are to be found in the fields of history, philosophy, science, and politics. Among these Montesquieu's masterpiece, the *Esprit des Lois*, has held, and probably will ever hold, one of the highest places in the literature of law, liberty, and society.

1760	Settled at Ferney,	66
1764	*Dictionaire Philosophique,* "Dictionary of Philosophy,"	70
1778	Visited Paris, where he died,	84

VOLTAIRE, probably the greatest of French writers, and the world's greatest critic, was the literary name adopted by FRANÇOIS MARIE AROUET. He was born February 21, 1694, at Châtenay, near Paris, France, the third son of a successful notary. His mother belonged to a noble family of Poitou, was intelligent, witty, and attractive, and died before her son reached his twentieth year.

The godfather and first teacher of young Arouet was Abbé de Châteauneuf, whose morals like his religion were anything but strict; and it is to his influence that the pupil was early indoctrinated in the skeptical literature which was then becoming the fashion in France. Arouet's further education was obtained in the Jesuit college of Louis-le-Grand, where his proficiency in all studies speedily attracted attention. On leaving the college, he was introduced by his godfather to the friendship of the celebrated Ninon de Lenclos, with whom he soon became a favorite, and who, at her death, left him two thousand livres for the purpose of purchasing books.

Alarmed by the dissipated life to which he was attracted, his father sent him as secretary to the Marquis Châteauneuf, French ambassador to Holland; but, in consequence of an intrigue with the daughter of Madame du Noyer, Arouet was sent home in disgrace. He now attracted the attention of that portion of the nobility which aspired to the honors of authorship, and were wont at all times to patronize genius. But his father had destined him for the bar, and, at the parental command, he entered an attorney's office. His stay in it, however, was short, and he soon obtained notoriety as the author of a satire on his successful rival in the poetic competition for an academy prize. His father now withdrew all countenance or support from him, and he requested permission to depart for America.

While these family troubles were brooding, a friend of the family interceded, and invited him to take up his residence at St. Ange. M. Caumartin, his new protector, had been a courtier in the reign of Louis XIV., and it was due to the literary discussions in his household that Voltaire conceived the idea of *La Henriade* and the *Siècle de Louis XIV*. He began to test his faculties for the task by writing a satire upon the deceased monarch, for which he was sent to the Bastille in 1717, there with leisure to make the most of his "thick-coming fancies." His case was not hopeless, and his spirits, therefore, suffered no diminution, as proofs of which he sketched the plan of *La Henriade* and corrected his poem of *Œdipe*. He was soon after liberated by the regent duke of Orleans, to whom he expressed his gratitude for the food which he had received, but hoped that his royal highness would not, hereafter, trouble himself by providing him with a lodging. It was soon after this event that he assumed the name of Voltaire.

After some difficulty Voltaire's play was accepted at the theater, where its success was instant and great. The liveliness of the dialogue, and the daring freedom of its opinions, attracted the attention not only of literary men, but seemed to point him out to the multitude as the true censor of the time. In some of his after works his attacks upon religion were more open, and the peculiar bent of his genius more strongly defined; but certain lines in the play formed the basis of a warfare which ceased only with the death of their author.

Rank and beauty, however, were now eager to pay him homage. He became the favored guest and companion of the greatest personages in Paris. He was very graciously received by the Marchioness de Villars, with whom, it is said, he fell desperately in love, but she does not appear to have given him the slightest encouragement.

Some political friendships which procured him an order to quit Paris, and the composition of the tragedy of *Artémire*, were the occupations of the intervening period until 1722, when he went to Holland. At Brussels he met Jean Jacques Rousseau; and if the twin celebrities had given the world any occasion to doubt the reality of the esteem which they professed to feel for each other in absence, the manner of their parting left no room to question the sincerity of their hatred. They could not endure the thought of each other's eminence, and, for the remainder of his life, Rousseau lavished upon his rival all the abuse of a mind fertile beyond all others in its capacity of expressing sentiments of dislike. The immediate cause of quarrel is said to have been a jest uttered by Voltaire, upon hearing his friend recite his "Ode to Posterity," which he said would never reach those to whom it was addressed. A less grave offense has ere now been visited by a worse punishment.

The publication of *La Henriade* had attracted all attention to his genius and pursuits; but, as before, the atmosphere of Paris was soon found injurious to his comfort. He had satirized a courtier, who took a very intelligible way of answering the epigram, by sending his servants to inflict personal chastisement upon the writer, which they bestowed on Voltaire in public. Voltaire challenged the author of the outrage, and was once more —1726 — thrown into the Bastille, and liberated only on the condition that he quit Paris. He accordingly proceeded to England where he landed in May, 1726, and continued to reside during the next three years.

This visit was one of the most important events of Voltaire's life. While in that country he was particularly struck with the absolute freedom of thought which prevailed. He was introduced by Lord Bolingbroke to Pope and his circle. He made the acquaintance of Peterborough, Chesterfield, and the duchess of Marlborough, and became intimate with Young, Thomson, and Gay. He acquired some knowledge of Shakespeare and Milton, Dryden and Butler, Addison's *Cato*, and the restoration dramatists. He was strongly attracted to Locke's philosophy, and he mastered the elements of Newton's astronomical physics. Bolingbroke and the English deists furnished him with many of his weapons. Queen Caroline accepted his dedication to her of a new version of *La Henriade*, and, when permitted to return to France, he took with him his "History of Charles XII.," and the material for his "Letters on the English."

On returning to Paris he published the *Histoire de Charles XII.* in 1730, and the *Lettres sur les Anglais*, or "Letters on the English," in 1731, and shortly thereafter his tragedies *Zaïre* and *Brutus*. In the "Letters" he expressed his admiration for English institutions; and drew a long series of comparisons between the state of things in France and in England, in which the advantage was always accorded to the latter nation. The dissolute manners of the French aristocracy were powerfully contrasted with the sober tone of character everywhere displayed in England by both nobility and churchmen. He could not repress his theistical and liberal views. His "Letters" were publicly burned, and he himself was again threatened with arrest and imprisonment.

Meanwhile, the death of his father and brother, the sale of his works, and some fortunate speculations in the proceeds realized for him a considerable fortune; and, with that worldly wisdom which distinguished him, he invested it safely, and retired in 1734 to Cirey, in Lorraine, to the château of the learned Madame du Châtelet, with whom he generally resided until her death in 1749. Many of the best works of Voltaire were composed in this retreat. Here he wrote the dramas *Mérope* and *Mahomet*, his "Treatise on Metaphysics," much of his "Age of Louis XIV.," and his "Elements of the Philosophy of Newton."

After the appearance of his "Letters on the English" he had been out of favor at court. But his *La Princesse de Navarre*, performed on the occasion of the dauphin's marriage, pleased Louis XV. by its adroit adulation, and he returned for some time to Paris. This, and the patronage of Madame de Pompadour, procured him the appointments of royal historiographer and of gentleman-in-ordinary to the king, as well as his election to the French academy in 1746. To this period belong *Zadig* and other oriental tales.

Several years before the last named date, Frederick of Prussia had written to Voltaire and expressed his admiration of the genius which was then dazzling Europe. This led to an intimacy between prince and poet which was kept up by a constant exchange of letters. When Frederick succeeded to the throne in 1740, he invited Voltaire to visit him at Berlin. But the latter was unwilling to separate himself from Madame du Châtelet.

He accepted, however, in 1743, a mission from the government to visit Frederick for the purpose of securing Prussia's alliance with France, in which undertaking he was successful. The death of Madame du Châtelet, in 1749, allowed him at last to accept the repeated invitations of Frederick the Great, and in July, 1750, he found himself at Berlin, as king's chamberlain, with a pension of twenty thousand francs and residence in one of the royal palaces.

Voltaire was received by Frederick with the most flattering demonstrations of regard. He and Frederick studied together two hours every day, and in the evening he was entertained at the king's own table. But this charming life was destined to be of short duration. "Never," says Macaulay, "had there met two persons so exquisitely fitted to plague each other. Each of them had exactly the fault of which the other was most impatient, and they were in different ways the most impatient of mankind."

Voltaire here completed his *Siècle de Louis XIV.*, and Frederick submitted his verses and essays for criticism. It was quite impossible for Voltaire to correct his majesty's verses without ridicule; and their intimacy ended in a violent rupture. In March, 1753, they parted never to meet again. On his way home Voltaire carried some of the king's poems with him, and was arrested at Frankfort under circumstances of considerable annoyance and disgrace. His description of Frederick's court is one of the most striking pictures in literature. About 1755 he wrote the mock-heroic poem *La Pucelle*, of which the history of Joan of Arc forms the subject. This is regarded as the masterpiece of his poetic genius, though a ribald caricature, and otherwise marred.

In 1760 Voltaire established himself at Ferney, near Geneva, in Switzerland. Here he spent perhaps the most tranquil, as well as the most creditable and useful portion of his life. The village or town was greatly improved and enlarged under his auspices; new houses were built, and a small theater established. He farmed, reclaimed waste land, planted, and reared poultry and horses. He also established a watchmaking industry, and, it is said, even erected a church. Certain it is he proved a benefactor to the inhabitants of Ferney and the vicinity.

It was here, too, that he either wrote or finished some of his greatest literary works, among which the most valuable and perhaps the most original was his *Essai sur les Mœurs et l'Esprit des Nations*, "Essay on the Manners and the Spirit of Nations," a philosophy of history. His *Candide*, the most remarkable of his prose fictions, appeared in 1758. Several years later appeared the first of those writings avowedly assailing the Christian faith which flowed from his pen until the end of his life. He had now become, in a sense, the founder of a new sect of thinkers and writers, who, under the lead of Diderot and D'Alembert, embodied their ideas in the great *Encyclopédie*, which was, however, suspended by the French government on account of its violent attacks upon Christianity.

The one aspect of Voltaire's character, which, at this distance, can be viewed with unmingled approbation, was the deep resentment with which he viewed every flagrant act of cruelty or oppression, whatever the motive. In 1762 Jean Calas had been falsely condemned of having, from Protestant zeal, killed one of his sons to keep him from turning Catholic. Voltaire exerted himself successfully to get the sentence annulled, and to rescue the other members of the same family from banishment. This and similar efforts on behalf of victims of French religious fanaticism brought him the admiration of many to whom his attacks on the church were utterly repugnant. He also opposed the atheism of Baron d'Holbach's *Système de la Nature*, and it is only proper to observe that the charge of atheism, which has often been brought against Voltaire himself, is wholly without foundation. On the other hand, he was a decided theist, and he rebuked the philosophy of his age which tried to banish God from the universe.

At the age of eighty-four Voltaire paid a last visit to Paris, ostensibly to present his new play, *Irène*, and was received as the divinity of reason. Incense, such as is rarely offered to mortal man — for be it recollected it was sincere, if really undeserved — was poured upon him, all classes of society holding the glittering urns. At the theater his bust was crowned with laurels and garlands of roses, amid the shouts and tears of the audience. He exclaimed, "You will make me die with pleasure; you will stifle me with roses." The exhaustion produced by this great excitement appears to have been the cause of his death, which took place May 30, 1778. His remains were placed in the

Pantheon in 1791, but were removed at the restoration. In person he was short of stature, and small even to attenuation.

Voltaire's *Zaïre* is called the greatest of French tragedies, and his *La Henriade* may be said to be the only successful epic in the French language. It is a masterpiece of clear, elegant, animated, and rapid narration. His *Siècle de Louis XIV.* holds the second place. Among the most noted of the dramas, besides *Zaïre* and the *Œdipe*, may be named *Brutus*, *Alzire*, *Mérope*, *Sémiramis*, *Oreste*, *Rome Sauvée* or "Catiline," *Artémire*, and *Tancrède*.

Voltaire was the sovereign writer of his century. He has been described as the man "whom the French had long waited for, to produce at once in a single life all that French genius most prized and most excelled in." Never had any nation produced such a terrible opponent of shams, and French existence was full of them. "Open scoundrels rode triumphant, be-crowned, be-coronetted, be-mitred; the race of quacks had grown numerous as the sands of the sea." Monarchy had lost its authority, aristocracy its strength, and religion even its decency. The foundations of rule were undermined, and Voltaire ably pointed out the actual extent of the ravages. To him was assigned the task of pulling down, and he performed his work in a manner which has left no room for cavil.

The eloquent testimony of Victor Hugo is convincing evidence that the true fame of Voltaire was destined to be sustained by the judgment of posterity. "Voltaire, so great in the eighteenth century," he said, "is still greater in the nineteenth. The grave is a crucible. That earth, thrown on a man, sifts his name, and allows that name to pass forth only purified. Voltaire has lost his false glory and retained the true. To lose the false is to gain. Voltaire is neither a lyric poet, nor a comic poet, nor a tragic poet; he is the indignant yet tender critic of the old world; he is the mild reformer of manners; he is the man who softens men. Voltaire, who has lost ground as a poet, has risen as an apostle. He has done what is good, rather than what is beautiful. * * * Voltaire is common sense in a continual stream. Excepting in literature, he is a good judge in everything. Voltaire was, in spite of his insulters, almost adored during his lifetime; he is in our days admired, now that the true facts of the case are known. The eighteenth century saw his mind: we see his soul."

He expressed, in language which no man can rival, the opinions which no man could deny. Every assertion obtained credence; every brilliant faculty found its enthusiastic admirers, for the reason that the public mind had become full, and needed an organ of utterance. Great souls are always specially missioned either directly from heaven as teachers of new truths; or indirectly by universal nature as destroyers of falsehood. It was the lot of Voltaire to be born into the latter class. He saw the false, but failed to discover the true.

But if ever a man was called, not to science, metaphysics, theology, or poetry even, but to literature alone, that man was Voltaire. Literature is really an art form, as distinguished from those efforts of the intellect which strive to increase knowledge. "Voltaire is the very first man in the world," says a contemporary of his day, "at writing down what other people have thought"; and after Euler had borne away the prize at the academy, and death had removed the scientific Madame du Châtelet, Voltaire succumbed to the dictates of his own reason and the advice of friends, and devoted himself to literature alone.

"Voltaire's ascendancy," says Morley, "sprung from no appeal to those parts of human nature in which ascetic practice has its foundation. Full exercise and play for every part was the key of all his teaching. He had not Greek serenity and composure of spirit, but he had Greek exultation in every known form of intellectual activity, and this audacious curiosity he made general. Voltairism was primarily and directly altogether an intellectual movement for this reason, that it was primarily and directly a reaction against the subordination of the intellectual to the moral side of men, carried to an excess that was at length fraught with fatal mischief."

Voltaire's greatest quality, as well as his great fault, is clearly set forth by Taine in "The Ancient Régime," and this judgment may be accepted as the final decision in a difficult case.

"An entire philosophy, ten volumes of theology, an abstract science, a special library, an important branch of erudition, of human experience and invention, is thus reduced in his hands to a phrase or to a stanza. From the enormous mass of riven or compact scoriæ he extracts whatever is essential, a grain of gold or of copper as a specimen of the rest, presenting this to us in its most convenient and most manageable form, in a simile, in a metaphor, in an epigram that becomes a proverb. In this no ancient or modern writer approaches him; in simplification and in popularization he has not his equal in the world. Without departing from the usual conventional tone, and, as if in sport, he puts into little portable phrases the greatest discoveries and hypotheses of the human mind, the theories of Descartes, Malebranche, Leibnitz, Locke, and Newton, the diverse religions of antiquity and of modern times, every known system of physics, physiology, geology, morality, natural law, and political economy, in short, all the generalized conceptions in every order of knowledge to which humanity had attained in the eighteenth century.

"His tendency in this direction is so strong as to carry him too far; he belittles great things by rendering them accessible. Religion, legend, ancient popular poesy, the spontaneous creations of instinct, the vague visions of primitive times, are not thus to be converted into small current coin; they are not subjects of amusing and lively conversation. A piquant witticism is not an expression of all this, but simply a travesty."

This estimate is certainly truer than that of Goethe, who declared that Voltaire was "the greatest literary man of all time, the most astonishing creation of the Author of Nature."

GOTTHOLD EPHRAIM LESSING, celebrated dramatist and critic, may properly be regarded as the founder of modern German literature. The son of a Lutheran pastor, he was born at Kamenz, Saxony, on January 22, 1729. It was intended by his father that he, likewise, should prepare for the ministry, and, accordingly, at the age of seventeen he entered the university at Leipzig. While here his taste for general literature and his fondness for the theater caused him to neglect and ultimately to abandon the study of theology, that he might devote himself wholly to his favorite pursuits. While in his third semester at the university in 1748, he produced his first comedy, *Der Junge Gelehrte,* "The Young Scholar." His father — both a poor man and severely orthodox — was dissatisfied with this course and called his son home. He went to Berlin, however, and finally completed his academic education at Wittenberg, and received his master's degree in 1752.

After graduation Lessing cast himself fairly on the world as a man of letters, and took up his residence at Berlin, where he remained for seven years. Even in this opening stage of his career, he firmly established his position as the earliest and most energetic of the pioneers who prepared the way for an original development of German literature. His chief friends and coadjutors at this time were the philosophical Jew, Moses Mendelssohn, and Nicolai, the author and bookseller. With the former he wrote an essay on *Pope als Metaphysiker* — "Pope as a Metaphysician" — and coöperated in laying the foundation of criticism in Germany, by means of the *Bibliothek der Schönen Wissenschaften,* or "Library of the Beautiful Sciences," a literary journal, and the *Litteraturbriefe,* "Letters on Literature." In these he revolted from the dictatorship of French literary taste — especially in drama — and extolled Shakespeare.

Not to mention several dramas of minor importance, he brought out, in 1755, the prose drama, "Miss Sara Sampson," a tragedy which was received by the German public with extraordinary favor, and was translated into other languages. About this time, too, he partly composed, also in prose, his vigorous and impressive tragedy of *Emilia Galotti,* a modern adaptation of the story of Virginia. To this period likewise belong his fables, which, both metrical and prose, are very striking pieces of reflection, and, like all his other writings, models of clear and symmetrical style.

In 1760 Lessing lived at Breslau, as secretary to the commandant, General von Tauentzien. Here he seems to have been less steadily industrious than before, mixing a good deal in society, and having for a time a strange fondness for the gaming table. But, at Breslau, among his military acquaintances, he planned his spirited drama, *Minna von Barnhelm.* Here also the study of the arts of design, to which, as exhibited in the masterpieces of Greece, Winckelmann was now inviting attention, led him to begin the most valuable of all his works, *Laokoon,* or an "Essay on the Limits of Poetry and Painting," which was completed at Berlin, and published in 1766. The title of this admirable work indicates but imperfectly its commanding scope. The comparison instituted is between poetry on the one hand, and the arts of design on the other; and between the several fine arts (poetry included), as contrasted with each other. The purpose of all these arts being assumed to be substantially the same, those differences of process are indicated which arise between the arts by reason of the differences in their instruments. This, like all Lessing's other philosophical speculations, is merely a fragment, a collection of hints, not the exposition of a system; but the principles, which he has here established, go further toward founding a just theory of literature and art than any other æsthetical work that could be named.

For some years after leaving Breslau, Lessing led a shifting and uncomfortable life. His longest residence was at Hamburg, where he became by necessity, not from choice, director of a theater set on foot by some sanguine lovers of the drama. One satisfactory fruit of this abortive undertaking was the series of masterly criticism on celebrated plays, which he called the *Hamburgische Dramaturgie,* "Hamburg Dramaturgy." By way of diversion he accompanied young Prince Leopold of Brunswick to Italy, where he spent eight months, and upon his return, in 1770, was appointed by the duke of Brunswick librarian of the celebrated library at Wolfenbüttel, near Brunswick.

Here he spent the last eleven years of his troubled life, and completed his *Emilia Galotti.* He was, indeed, meritoriously active and useful in discharging the duties of his office; but he became entangled more hotly than ever in those theological controversies, which he seems to have entered at first only as the champion of literature and the drama, but in which he now, in turn, became the assailant. His deviations from orthodox belief were denounced loudly on his publishing a piece called "Fragments of an Anonymous Writer," on the discrepancies of the gospel narratives, by Reimarus, who, however, at that time was not known as the author.

Shortly before taking up his work at Wolfenbüttel, Lessing had married the widow of a Hamburg merchant. His wife died in giving birth to his first child, who died with her. This terrible blow completely prostrated him; his spirits sank, and he became weary of existence. His theological conflicts alone afforded him a certain amount of relief; and it was in his desperate struggle with what he considered intolerance that he developed his greatest energy, and the richest resources of his intellect. In 1779 he gave his confession of faith in a poetical and dramatic form in his *Nathan der Weise,* "Nathan the Wise," a fine and interesting series of epic pictures and solemn thoughts. His last work was a short treatise on "The Education of the Human Race," the germ of Herder's subsequent work, and of all later works on the education of the human race.

His extraordinary activity and incessant application at length wore out his physical constitution, and after much sickness and vexation he died at Brunswick, February 15, 1781, when but fifty-two years of age. So impoverished was he at his death that his patron, the duke of Brunswick, had to defray the expenses of his funeral.

At the date of Lessing's birth it could hardly be said that a national German literature existed, nor had those peculiar philosophic and critical movements begun which have long inspired its popular life. But the period was auspicious for a revival. Frederick the Great had just burst the limits that restrained the political influence of northern Germany, and, by a series of exploits unparalleled in modern warfare, was evoking the heroic in Teutonic genius, and teaching his people self-respect and self-dependence, by his vigorous compulsion of Europe to recognize Prussia as one of her integrant nations.

Lessing was the Frederick of thought. By nature wholly Teutonic, he, too, sounded a trumpet call; and with a restless energy in nowise inferior to Frederick's, an activity and plentitude of resources that overlooked no opportunity, he dashed, now into this region of dormant literature, now into that unpenetrated department of philosophy, until he had laid the foundation of almost every conquest that has illustrated the recent ever-memorable career of his kindred. The earliest efforts of this remarkable person lay in that direction in which he accomplished one of his latest and greatest triumphs, viz.: literary criticism and æsthetics. His "History of the Theater," "Letters on Literature," his "Life of Sophocles," his "Dramaturgy," his "Fables," perhaps, and his "Theory of the Apologue" belonged to a career which culminated in the *Laokoon* — that great classic treatise on the respective limits and characteristics of painting and poetry.

Without forgetting the immense debt that must ever be held due to Winckelmann, it may be said with justice, that in Lessing's *Laokoon* all those rich thoughts and aspirations concerning art, which so enrich modern Teutonic speculation, find their natural root. Striking at once at the principle of distinction, he establishes that as the arts of design labor for the gratification of the outward sense, their proper sphere is within the beautiful; whereas poetry and written thought appeal to the imagination, which can reconcile itself even to deformity. "The consequences," says Goethe, "of this splendid thought were illumined to us as by a lightning flash; all the criticism that had hitherto passed sentence was thrown away like a wornout garment; we thought ourselves redeemed from all evil, and fancied that we might venture to look down with some compassion upon the otherwise so splendid sixteenth century, when, in German sculptures and poems, they knew how to represent life only under the form of a well-bedizened fool, death under the misformed shape of a rattling skeleton, and the necessary and accredited evils of the world under the image of a devil in caricature."

Lessing, however, did not confine himself to precepts, to the practical revival of that highest and profoundest art. Beginning with a drama of common life, "Miss Sara Sampson," he entered a vigorous protest against the frivolities of the super-classic school, and asserted the true function of the drama. Next and far more perfect, *Minna von Barnhelm;* then his still greater work, *Emilia Galotti;* and he crowned his triumph by the incomparable *Nathan der Weise.* Incapable of their reach of imagination, and by no means gifted with the amazing penetrating power of Shakespeare or Goethe, nevertheless, Lessing has been surpassed by few in that species of drama named the moral drama — that one, which, in the largest sense, aims at manifesting systematically, through the dramatic form, the sphere and aspect of some great principle.

His analytic faculty was of the first order; his conceptions rarely equaled in definiteness; and his mode of expression especially excelled in chastity, energy, and precision. Who has read *Nathan,* and can again lose sight of him? Few creations surpass this hero in the qualities of repose and elevation; nor do some of the inferior characters fail to attract corresponding admiration. It was Lessing's last great work; but its accents have provoked more than an empty and dying echo: they have raised many hearts to the highest conception we can form of the virtues of charity and tolerance.

The intellect and influence of Lessing extended far beyond the range of æsthetics and the drama. Nor has his sway over Germany, or rather his profound appreciation of its tendencies, and foresight of their effects, more striking illustration than in the celebrated Wolfenbüttel "Fragments" beforementioned — the work of Reimarus, although shaped and annotated by Lessing. These remarkable writings first stirred that spirit, which issued in the memorable critical and rational schools of Germany. In these "Fragments" appears the first formal attack on the then unquestioned tenet of Protestant churches — the absolute authority of the scriptures. These writings are declared to be mere historical documents, which, like all other such documents, must be subjected to the test of criticism. It is asserted that the foundations of Christianity are not solely in the gospels — which may be modified by inquiry, their text altered, and much of it repudiated as spurious; but that Christianity is in the heart of the reason of man.

It is, of course, quite out of place to criticise here, favorably or unfavorably, these Wolfenbüttel propositions. The important point is, that under the conduct of Lessing they foreshadowed, for good or for evil, so much of the future of German theological thought, and laid the foundation of modern biblical criticism. Lessing followed these up with his tract on *Die Erziehung des Menschengeschlechts*, in which he attempted to shadow out more definitely the probable future relation of humanity to the Christian revelation.

There are few departments of thought into which he did not penetrate, and none into which he penetrated without leaving the impress of his genius behind him. So varied and catholic were his interests that to many he is known only as a theologian, to others as an æsthetician, to others again as a dramatist, poet, critic, or philologist. He polished his mother tongue and made it classical; and, as we have seen, he initiated several of the more remarkable movements for which German thought is still famous. His life was that of a brave, unbending, literary man. He was not exempt from all its errors, but even amidst error he possessed himself — he did not resign the freedom, or compromise the dignity of the thinker.

Lessing was rather above the middle height, and during the greater part of his life maintained an appearance of vigor and elasticity. Luther himself was not of a more fearless and independent character. In an age when men of letters were fond of grouping themselves in sects and coteries, Lessing pursued his own way, unmoved by clamor, and indifferent to popular favor. Yet no man was ever more warmly loved by friends, and he had the satisfaction of knowing that the younger generation of writers looked up to him with confidence and reverence.

Johann Jacobi wished for many years to make his acquaintance, but was deterred from addressing him, as he explained to Lessing, by a profound consciousness of the difference between himself and one whom he regarded as "a king among minds." It may be questioned whether there is any other writer to whom the Germans owe a deeper debt of gratitude. He was succeeded by poets and philosophers who for a time gave Germany the first place in the intellectual life of the world, and it was Lessing, as they always acknowledged, who prepared the way for their achievements. Without attaching himself to any particular system of philosophical doctrine, he fought incessantly against error, and, in regard to art, poetry, the drama, and religion, suggested ideas which kindled the enthusiasm of aspiring minds, and stimulated their highest energies.

While his work was thus effective in its own day, it has lost little of its value for later ages. His great dramas have imaginative qualities which appeal to every generation, and an unfading charm is conferred on his critical and theological writings by the power and classical purity of his style.

GIBBON

EDWARD GIBBON, greatest of English historians, was the son of an English country gentleman in easy circumstances, who for some years was a member of the British parliament. He was born at Putney, in Surrey, England, April 27, 1737, and was the first and only surviving child out of a family of seven, the others having died in infancy. In early years his constitution was so delicate that his life repeatedly trembled in the balance; but, due to the tender nursing of a maiden aunt, he safely passed into manhood.

When nine years old he was placed in a school at Kingston-on-Thames, but his delicate health prevented his deriving much instruction during the period he resided there. On the death of his mother in 1747 he returned home, where he remained for two years, after which he entered Westminster school. His studies were so frequently interrupted by illness that he made but slow progress; and after two years his father removed him to Bath, where the full restoration of his health was eventually attained.

In 1752 Gibbon matriculated at Magdalen college, Oxford. In his autobiographic memoirs he describes himself at this time to have had "a stock of erudition that might have puzzled a doctor, and a degree of ignorance of which a schoolboy might have been ashamed"; nor does his residence at the university appear to have greatly replenished his imperfect scholastic attainments. During his second year at Oxford his reading took a religious turn, and the study of Bossuet's "Variations of Protestantism," and "Exposition of Catholic Doctrine," effected his conversion to the Roman Catholic religion. The consequence of this change was his expulsion from the university.

His father was indignant at his son's change of religion, and placed him under the care of M. Pavilliard, a Calvinist minister at Lausanne, in Switzerland, in the hope of reclaiming him from Roman Catholicism. In this his new tutor was speedily successful; and Gibbon publicly renounced, in 1754, the faith which he had adopted but twelve months before. He here began and carried out those studies in French literature and the Latin classics which, aided by his prodigious memory, made him a master of erudition without a superior, and with hardly an equal.

Here, also, he fell in love with Susanne Curchod, daughter of the minister of Crassy, but he was obliged to submit to his father's disapproval of a marriage with her. She subsequently became the wife of the great French minister, M. Necker, and mother of Madame de Staël. This disappointment impelled him to redouble his attention to his literary pursuits; and he returned to England in 1758, with the first pages of a little book written in French, entitled *Essai sur l'Étude de la Littérature*, "Essay on the Study of Literature." This was not published, however, until some three years afterward. It received but slight notice in England, though on the continent it was favorably viewed.

Gibbon now conceived a taste for the army, and in 1760 obtained a commission as captain in the Hampshire militia. For two years and a half he spent what he describes as "a wandering life of military servitude, which terminated in the disbanding of the regiment in 1763." According to the custom of the times, it was considered essential to the education of an English gentleman to make the tour of the continent, and accordingly Gibbon started on his travels, furnished with letters of recommendation to persons of influence in France and elsewhere. At Paris he found that the fame of his "Essays" had preceded him, and he was cordially received by the great French *litterateurs*. After a residence of some months in Paris, he revisited Lausanne, and afterward went to Rome. While there, he says in his memoirs, it was "on the 15th of October, 1764, as I sat musing amidst the ruins of the capital, while the barefooted friars were singing vespers in the temple of Jupiter, that the idea of writing the decline and fall of the city first started to my mind."

In the following year Gibbon returned home to England, and the next five years he describes as having been the least satisfactory of his life, affording few incidents worthy of record.

A portion of each year he spent with his regiment, in which he had risen to the rank of lieutenant colonel, though he observes that he was disgusted with "the inn, the wine, and the company." In 1767 he published a work entitled *Memoires Litteraires de la Grand Bretagne*, "Literary Memoirs of Great Britain," in the preparation of which he was associated with M. Deyverdun, a young Swiss gentleman with whom he had become acquainted at Lausanne. The book, however, received but little approval. His next production, *Critical Observations on the Sixth Book of the Æneid*, was more successful. His father died in 1770, and left him in comparatively easy circumstances. For the next few years he settled in London, and employed himself in preparing for his great historical account of the decline and fall of the Roman empire.

In 1774 Gibbon was elected to parliament for the borough of Liskeard, through the influence of a kinsman; but he did not let his parliamentary duties interfere with his literary labors. He afterward, also, was elected for Lymington — altogether for eight sessions, without ever summoning courage to speak. According to his own account, he had entered upon a public career "without patriotism and without ambition," and consequently proved but an indifferent politician.

Meanwhile, after the labors of seven years, the first volume of the *Decline and Fall* had appeared on February 17, 1776, and was received with unbounded admiration. Its literary success was immediate; but the public was not slow to discern, nor tardy to censure, the sceptical tendency of certain chapters in which the historian shadowed forth his ironical scruples as to the truths of Christianity. The whole of the first edition was sold in a few days, and others followed in rapid succession.

The publication of the volume created a great sensation, and Gibbon found his reputation established amidst universal applause. Its vast plan, so well conceived, and executed in polished and elegant style, gave the work a rapid and brilliant success. Even those who might with justice be considered his rivals — Robertson, Ferguson, and Hume — sent him warm congratulations.

Two more volumes of his great work were ready in 1781. In 1783, finding it difficult to live in London upon his income, he settled down again at Lausanne. Here, in a charming house on the borders of Lake Geneva, he terminated his great history in 1787, and immediately started for England to arrange for its publication. The last two volumes were issued in May, 1788. His profits from the entire work are said to have been about six thousand pounds, and that of the publishers sixty thousand pounds. The spring of 1788 saw him again settled at Lausanne, where he resided until 1793, when he resolved on another visit to England, this time to comfort his old friend Holroyd, who had lost his wife.

Though Gibbon was now feeble in health and corpulent to an extraordinary degree, the fatigue and dangers even of the journey were nothing to the affection he felt for his bereaved friends, and he hastened to mingle his tears with theirs. He arrived after a rapid journey in his usual health, but at the end of six months Edward Gibbon was no more. He died January 16, 1794, at the age of fifty-seven, of a disease from which he had suffered for thirty-two years.

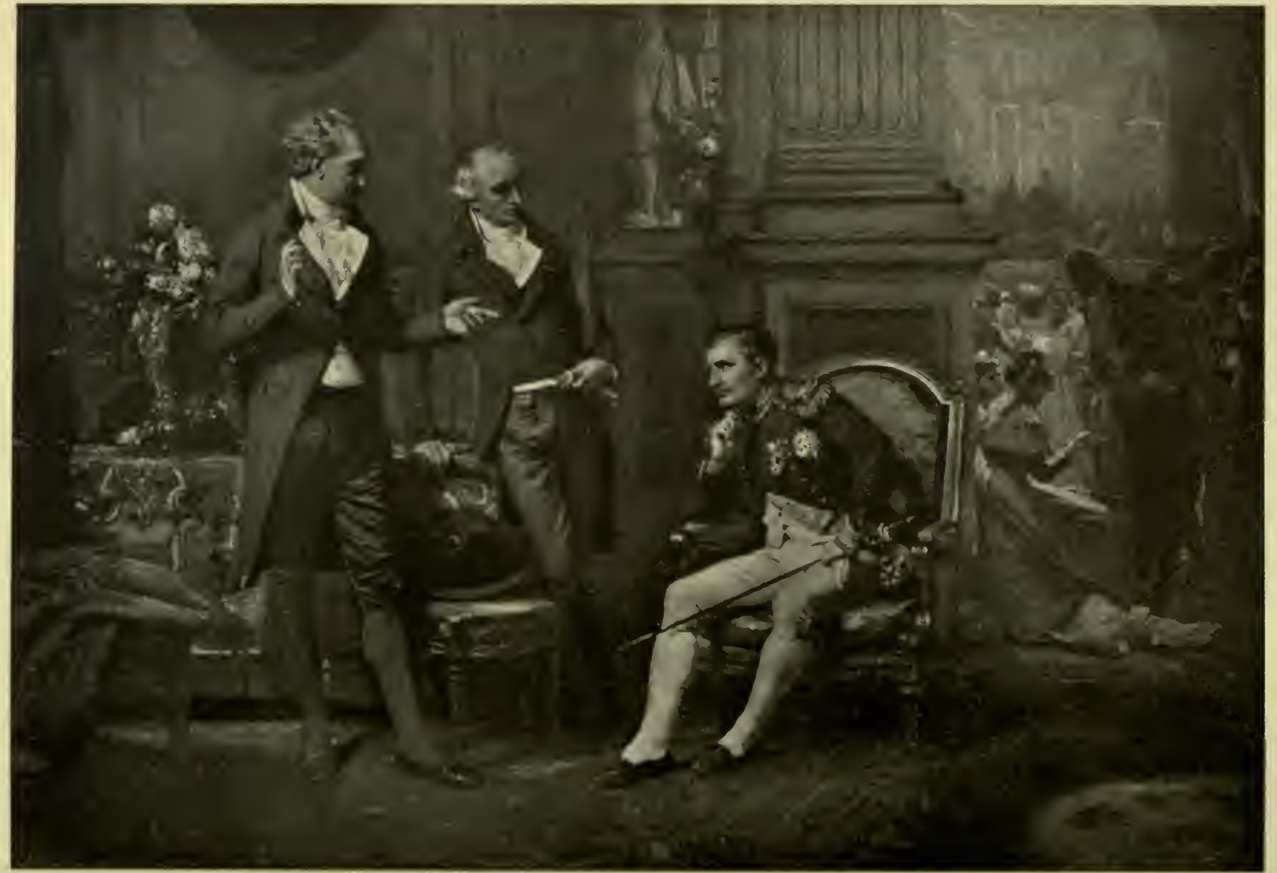
In personal appearance Gibbon was heavy and dull, his countenance showed little trace of intellect, and his features were unattractive. He possessed a short Silenus-like figure — not more than fifty-six inches in height — slim legs, large turn-in feet, and a shrill, piercing voice. He was fond of fine dress, and his manner was somewhat pompous. His brain was exceptionally vigorous, and he had a vast capacity alike for work and for enjoyment. This capacity he never abused so as to burden his conscience or depress his spirits. "The madness of superfluous health I have never known," he says.

To illustrate the intensity of the pleasure he found alike in the solitude of his study and in the relaxations of genial social intercourse, almost any page taken at random, either from his memoirs or from his letters, would suffice. Many incidental touches show that he was not a stranger to the delights of quiet contemplation of the beauties and grandeurs of nature. His conversation, when he felt himself at home, was interesting and unaffected; and that he was capable alike of feeling and inspiring a very constant friendship, there are many witnesses to show. His temperament was frigid and comparatively passionless, and his most ardent admirers are constrained to admit that he was deficient in large-hearted benevolences. He possessed little of the "enthusiasm of humanity," and, as far as every sort of religious yearning or aspiration is concerned, his poverty was almost unique. Gibbon was such a man as Horace might have been, had the Roman epicurean been fonder of hard intellectual work, and less prone than he was to the indulgence of emotion.

The magnitude of Gibbon's work — his *Decline and Fall of the Roman Empire* — has been attested by the centuries. In it he proposed "to connect the ancient and modern history of the world." He divided it into three periods: (1) from Trajan to the fall of the Western empire; (2) from Justinian to the revival of the empire under Charlemagne; (3) from Charlemagne to the capture of Constantinople by the Turks. It is virtually a history of the civilized world for thirteen centuries, during which paganism was breaking down, and Christianity was superseding it.

His review of Roman jurisprudence has received the highest praise of lawyers and jurists. Of his account of the Christian church, Cardinal Newman said that in spite of its Voltairian sneers, no church history so adequate has been written; for Gibbon has created Catholicism, not as a body of doctrine, but as a social force.

The history of Constantinople is his greatest effort — his treatment of Julian, of Justinian, of the Arabs, and of the crusades, the most splendid single episodes in all historical literature. He has painted in gorgeous colors all the splendors of the ancient paganism, and portrayed with matchless force every figure



GOETHE
NAPOLEON

GOETHE AND NAPOLEON I.

From the painting by Hillemacher

that crossed the stage of history for a thousand years. For the moral beauty of Christianity alone, Gibbon has no enthusiasm — the heroism of its martyr-witnesses and its saints does not touch his imagination nor warm his dramatic sense to life.

This elemental defect set aside, few faults of detail have been discovered in his work, the enduring merit of which it may be permitted to summarize in the words of a great modern master of history, whose own studies have followed closely in his track:

"That Gibbon should ever be displaced," says E. A. Freeman, "seems impossible. That wonderful man monopolized, so to speak, the historical genius and the historical learning of a whole generation, and left little, indeed, of either for his contemporaries. He remains the one historian of the eighteenth century whom modern research has neither set aside nor threatened to set aside. We may correct and improve from the stores which have been opened since Gibbon's time; we may write again large parts of his story from other and often truer and more wholesome points of view; but the work of Gibbon as a whole, as the encyclopedic history of thirteen hundred years, as the grandest of historical designs, carried out alike with wonderful power and with wonderful accuracy, must ever keep its place. Whatever else is read, Gibbon must be read, too."

Perhaps the most unique merit of Gibbon is his supreme and almost epic power of moulding into a lucid unity a bewildering multitude of details, and giving life and sequence to the whole. His prodigious memory moved freely under a ponderous weight of learning, which his quickening imagination fused into a glowing stream of continuous narrative, which is yet, with all its detail, a marvel of condensation. On the whole, his monumental work is probably the greatest achievement of human thought and erudition in the department of history, and one of the greatest creations of any single intellect.

GOETHE

A. D.		AGE
1749	Born at Frankfort-on-the-Main,	..
1765	Studied at Leipzig,	16
1770	Entered Strassburg university,	21
1773	*Götz von Berlichingen,*	24
1774	*Die Leiden des Jungen Werther,* "The Sorrows of Young Werther"; visited Switzerland,	25
1775	Settled at Weimar,	26
1779	Privy councilor,	30
1786–88	Traveled in Italy; *Egmont,*	37–39
1787	*Iphigenie auf Taurus,*	38
1788	Met Schiller,	39
1790	Again visited Italy; *Tasso,*	41
1792	Accompanied the German invasion of France,	43
1796	*Wilhelm Meister's Lehrjahre,* "Wilhelm Meister's Apprenticeship,"	47
1797	*Hermann und Dorothea,*	48
1806	Married,	57
1808	First part of *Faust* completed,	59
1811	*Dichtung und Wahrheit,* "Poetry and Truth,"	62
1821	*Wilhelm Meister's Wanderjahre,* "Wilhelm Meister's Traveling Years,"	72
1832	Died at Weimar,	83

JOHANN WOLFGANG VON GOETHE, the most celebrated of German writers, and one of the most gifted of men, was born at Frankfort-on-the-Main, Prussia, August 28, 1749. His father, the son and grandson of craftsmen, achieved distinction in the university, became a doctor of laws, traveled much, collected works of art, and finally settled in his native city, where he held the rank of imperial councilor. His mother, Catharine Textor, daughter of the chief magistrate of the city, was a woman of noble and wide sympathies, and of a singularly bright and happy disposition. He was the eldest child, precocious, handsome, lively, and sensitive. Before he was ten years of age he wrote several languages and had a considerable familiarity with works of art. Indeed, the circumstances with which the poet was surrounded in early life were eminently favorable to the development of his great and varied powers, and undoubtedly contributed in no small degree to cultivate that many-sidedness for which he was afterward so distinguished. His boyhood and youth came in the period when Germany was excited by the seven years' war; and when, in literature, the clear and energetic Lessing was laying the foundation of philosophical criticism, inculcating intelligent respect and affection for the arts of design, and protesting against that slavish subservience to French taste which had long prevailed among German men of letters.

Sickness in childhood cherished Goethe's native precocity; and his mind was developed with remarkable rapidity. Besides the common branches of education, he busied himself with drawing, music, and natural history; and a boyish poem on the scriptural history of Joseph indicated at once his poetical inclinations, and the serious direction which his thoughts then took. After the breaking off of a youthful love affair, which gave a name to the heroine of *Faust*, and some features to *Wilhelm Meister*, he was sent to the university of Leipzig in 1765 to prepare himself for the legal profession. Law, however, was little attended to; and for speculative philosophy the young poet contracted a disgust, which he did not seek to overcome in mature life, even when Kant had become the guide of almost all the finer minds of his country. To classical studies, under the teaching of the correct and tasteful Ernesti, he paid more attention. To his early French reading was now added some acquaintance with English literature.

The discrepancies, however, between the different poetical schools, which he was unable to reconcile by any critical theory that had yet been presented to him, almost gave him a distaste even for poetry. His inquisitive and doubting temper found not less food in the contemplation of the relations of society, presented to him in no clearer light than that which he derived from the French encyclopedists; and his mind had already taken its earliest steps in that course of thought and feeling, which, breaking out at first in a rebellion against all existing systems, led him by degrees to care little as to the truth or falsehood of any. He made some attempts at play-writing; and the uneasy state of mind, which he thus endeavored to remove by giving vent to it, was allayed more effectually by the diversion of his thoughts to the study of the fine arts, in the works of Winckelmann and other philosophical antiquaries.

In 1768 Goethe left Leipzig, and resided for a while in the country, where he studied alchemy and chemistry, Paracelsus and Boerhaave, and sketched for himself a new religion, resting on a basis of mysticism or neo-Platonism. A couple of years later he went to the university at Strassburg to complete his studies, and earnestly devoted himself to chemistry, anatomy, literature, and antiquities, and, as far as was necessary, to law. Strassburg cathedral singularly interested him, so did the town, the Rhine, the Black Forest, and, indeed, the whole neighborhood, which became, in his youthful imagination, a "poetic paradise." At Strassburg he formed the acquaintance of Herder, who was already distinguished among the great men of Germany. The friendship thus formed had an important influence upon Goethe's mind. By Herder his attention was directed to the Hebrew poets, to Ossian, Homer, and Shakespeare. Goldsmith's *Vicar of Wakefield* especially delighted him.

At this time he met Friederike Brion, daughter of a Protestant pastor, with whom he fell passionately in love, and who returned his love. This attachment lasted for eighteen months, and was the inspiration of some of his loveliest lyrics. But finally he tore himself away from it, driven like Dante's Ulysses by the still stronger passion for experience of life which an early and obscure marriage would have narrowed. Of other ties formed and broken by Goethe during the years that followed, it is probably better to say little than to seek, with his extravagant adorers, a special code of morals for his failings. Certain it is that they will always tarnish to some extent the otherwise fair reputation of the poet.

In the year 1771 Goethe took his degree of doctor of laws, and went for a short time to Wetzlar, on the Lahn, the seat of the imperial chamber of the German empire, which afforded peculiar facilities for young men engaged in the study of public law. Here, however, knowledge of the human heart and of human character appealed to him much stronger than his profession; and Wetzlar became to him the scene of the famous "Sorrows of Young Werther," which has been described as "a glowing leaf from the life of the human soul, full of interest and beauty at all times, but which, in the state of European thought and feeling at that time, stirred the whole literary mind of Europe like a breeze sweeping over a forest." The book was not published until 1774.

In 1772 he returned to Frankfort, and remained at home four years. It was during this interval that he began the publication of his earliest successful works. His first dramatic effort, *Götz von Berlichingen*, published in 1773, drew instant attention by its grand ideas, profound sentiments, natural vigor, and its bold defiance of French criticism and the three unities. It was cast in the flexible and irregular mould of Shakespeare's dramatic histories. The novelty of the undertaking was as attractive as the force of imagination with which it was performed; and, while everyone was moved by the character and fate of the true-hearted Götz, there was for reflective minds a deep significance in the picture which was presented under the symbolic forms of feudalism, the destruction of the reign of force, and the rise of a new world ruled by reason and established order. Here, too, the poet, in the tumultuous excitement of youth, poured forth his emotions with an unrepressed and infectious enthusiasm.

In its design, "The Sorrows of Young Werther" was nothing more than a sentimental novel, and, thus bidding for a popularity much wider than *Götz,* displayed domestic scenes so interesting, and described these with a pathos so profound and an eloquence so flowing, that the hollowness of the morality was overlooked, and the real significance of the events forgotten. The German language possessed as yet nothing comparable to either of these two works. Their author himself never surpassed the *Götz;* and, after the appearance of *Werther,* Goethe was not only the most popular writer of his day, but also the writer from whom competent judges most confidently expected great performances in his maturity.

His fame immediately gained for him a position which enabled him to devote his energies, without interruption or anxiety, to literary study and invention. The opportunities were used with zealous industry throughout the remainder of his long life; and his skill of art was developed with a success atoning in some degree for that narrowing of his sympathies, which was caused by the artificial atmosphere of a petty court.

The duchess of Saxe-Weimar, left a widow during her son's infancy, the duke Karl August, not only administered wisely the civil affairs of his little sovereignty, but conceived the idea of making her miniature capital the intellectual center of Germany. In 1774, in the course of his travels, the young duke made the acquaintance of Goethe; and, on his assuming the government in 1775, the poet accepted the invitation he received to attach himself to the court of Weimar. The dowager duchess from the first had confidence in him, and by degrees he won the esteem of the young wife of Karl August. At Wiemar Goethe met Charlotte von Stein, who became his dearest friend, and for ten years was his confidante, his directress, and the object of his homage. Wieland, whose mental history was in some points not unlike that of Goethe, was already there, having been the prince's tutor. Herder was added to the band in 1776. Schiller was afterward one of its members for a few years; and other poets, critics, and novelists were gathered round these chiefs.

Goethe was the leading spirit of the group, even during the last quarter of the eighteenth century, when these men and others were constructing and guiding the literature of all Germany; and his supremacy became yet more absolute afterward, when for another generation he stood alone, the last survivor of a race greater than the greatest of their successors. He was ennobled, made privy councilor in 1779, and received other honored appointments, and had even some share in the statesmanship demanded by the small state. But, in the most active period of his life, his most important office was that of theatrical director.

In 1786 a visit to Italy gave fresh impetus to Goethe's literary and poetic instincts. He visited Rome, Naples, Florence, and Sicily, drawing inspiration from all he saw. The influence of this voyage seems impressed on all his after labors, and colored, measurably, his opinions and sentiments. He visited Italy again in 1790. At Rome he finished his play, *Iphigenie auf Taurus,* in 1787, that "marriage between the religious philosophy of Germany and the ancient Greek tragedy." *Egmont* followed *Iphigenie,* and *Tasso* appeared in 1790. *Egmont* and also another tragedy, *Clavigo,* were produced at Weimar. Many plays of Voltaire, Racine, Shakespeare, and Calderon were also represented. His *Tasso* is a realization of the fluttering spirit of romance which lingered in the courts and society of Italy when the realities of the middle ages had passed away. None of Goethe's works are so admirable as the *Tasso* and *Iphigenie* for skill of art; none are more exquisite in ideal beauty and imagery; none are so characteristically illustrative of the desire he always felt to attain, though it were by the sacrifice of sternly solemn truths, a placid and meditative harmony of feeling.

Goethe had returned to Weimar in 1788, and at that time met Schiller. In the autumn of that year he first became acquainted with Christiane Vulpius, a young woman in humble life, whom he afterward married. She had presented him with a petition entreating him to procure some position for her brother, a young author, then living at Jena. Goethe was greatly smitten with her beauty, simplicity, and sprightliness. His *liaison* with her gave rise to much scandal on account of the disparity of their station and the scandal was not lessened when, many years later — 1806 — he performed a tardy act of justice in marrying her. She had, in 1789, borne him a son, August von Goethe, to whom the duke of Saxe-Weimar stood godfather. After this event Goethe took Christiane, with her mother and sister, to live with him in his own house; and he appears always to have regarded the connection as a marriage. His conduct in relation to this affair was, however, a source of mortification and deep regret to many of his admirers.

In 1792 he accompanied the duke of Saxe-Weimar when the Prussian army invaded France. In that campaign he showed that he was not wanting in courage of the most reckless kind; but he returned to Weimar thoroughly disgusted with the war and with military life.

Perhaps the most interesting period in Goethe's life is between 1794 and 1805, during his intimacy with Schiller, the poet. This friendship proved very useful to both — it gave a stimulus to their literary activity. While Goethe, without wholly renouncing the drama, applied himself especially to romances and epic compositions, Schiller, during these eleven years, composed his finest tragedies. *Wilhelm Meister's Lehrjahre*, a work Goethe had commenced long before, was now completed in 1796. In the years 1796-97, the charming epic idyl, *Hermann und Dorothea*, was written; so was much of the first part of *Faust*, which, however, still lingered in his hands until 1808. In this Goethe attempted, as others had before him, to naturalize the classical hexameter in his native tongue, and to give epic form to a narrative of familiar life. The poet's fame now rose to its zenith, on the publication of the latter. For more than thirty years this work had been growing in the author's mind. It is easy to feel, or rather it is impossible not to feel, the singular poetic beauty of this wonderful poem, its unsurpassed felicities of imagery and diction, and the impressiveness of the despondent melancholy which is the ruling temper of the whole. Philosophically considered, *Faust* is a propounding of the enigma of human life, with a refusal to accept from religion its only possible solution. A willing victim of limitless desire, he is led, through grievous failure and sorrow, by large experience of human destiny lit up by glimpses of a nether and a higher world, to rest satisfied at the close of life with a little useful work honestly done. The Marguerite whom he betrays, soars, like the heavenly powers with whose choral song the poem begins, in glorified penitence above and beyond him.

There now occurred a long interval in Goethe's career, marked by nothing of distinguished note. When the French occupied Weimar, he took refuge in his books and scientific experiments, and exhibited such impassiveness amid the political disturbances as to incur the reproach of a want of patriotism. He afterward accepted Napoleon's invitation to visit Paris, and again met the great emperor, in 1808, at the congress of Erfurt. The appearance, in 1809, of the notorious novel, "Elective Affinities," while assuredly it denoted a falling off in creative genius, betrayed as clearly a settled declension of moral sentiment. The epicureanism, in which the poet now found repose, was worse than the sceptical spirit of resistance which had disturbed his aspiring youth.

In 1811 he published his interesting autobiography, *Dichtung und Wahrheit*, "Poetry and Truth," and a collection of lyrics appeared in 1819, but seem to have been written much earlier. In 1821 *Wilhelm Meister's Wanderjahre*, "Wilhelm Meister's Traveling Years," was completed, and after this Goethe's only sustained effort in poetry was the second part of *Faust*, which was finished near the close of his life.

A deep grief came to Goethe in 1816, in the death of his wife. The Goethe house would have been desolate but that in the following year his son, August, brought a bright and sweet-tempered wife to dwell there, and Goethe erelong found much joy in his three grandchildren. His daughter-in-law, Ottilie, presided over his household during the remainder of his life, and a beautiful picture of his old age is preserved for us in the conversations recorded by his friend Eckermann.

About a year after the completion of *Faust*, Goethe contracted a severe cold, which turned into a fatal fever; but he still continued to work. His last writing was an essay on the dispute between Saint-Hilaire and Cuvier, on the question of the unity of composition in the animal kingdom.

He worked until the last hour, and died sitting in his chair. Ottilie sat beside him, holding his hand in both hers. It was now observed that his thoughts began to wander incoherently. "See!" he exclaimed, "the lovely woman's head, with black curls in splendid colors, a dark background." Presently he saw a piece of paper on the floor, and asked how they could leave Schiller's letters so carelessly lying about. Then he slept softly. The last words audible were, "MORE LIGHT!" The final darkness grew apace, and he, whose eternal longings had been for more light, gave a parting cry for it as he was passing under the shadow of death. He died March 22, 1832, and was buried near Schiller in the ducal vault at Weimar.

In person, Goethe was eminently handsome — tall, graceful, and well proportioned. "That accordance of personal appearance with genius," says Heine, "which we ever desire to see in distinguished men, was found in perfection in Goethe. His outward appearance was just as imposing as the word that lives in his writings. Even his form was symmetrical, expressive of joy, nobly proportioned; and one might study the Grecian art upon it as well as upon an antique." The same writer continues in a more extravagant strain, "His eyes were calm as those of a god; and they remained in his latest age just as divine as in youth."

Many varying and contradictory opinions have been entertained about Goethe. But summed up in a word, the aim of his life was *culture* — in the widest and deepest sense. The distinctive characteristic of his genius was his insatiable curiosity in every branch of human knowledge. His life was equally divided between science and art — between the poetry of the heart and the keenly observant spirit of an enthusiastic lover of nature. He was so versatile, so many-sided, he did so many things well, and initiated so much, that it is difficult to say in what he was greatest. His *Götz* founded the romantic school; *Werther* founded the sentimental school; *Die Metamorphose der Pflanzen*, "Metamorphosis of Plants," is one of the pillars of Darwinism; and in the third act of *Faust* critics have discovered the foundation of a creed. It is not possible to read one of his works without learning a lesson of life.

Goethe was a born poet. To feel, to realize what he felt by idealizing it, and then to express it in verse, this was the natural bent of the man, and the actual history of his poems. This realistic foundation in personal experience, while assuring to his poetry sincerity and human interest, marks him off from Schiller and the idealistic school. But what confers on Goethe a royal rank among poets was the range and harmony of his spiritual faculties. To a unique personality and a boundless force of self-expansion, he joined a marvelous sensibility to impressions from all without him, from men and women, whether old or young; from society, solitude, and external nature; from books and from life; from the ancient world and the modern world; from art, but also from philosophy and physical science. His comic description of himself as *Das Weltkind* — "The World's Child" — was a true one.

His audacity of youthful passion was but the prelude to an all-embracing wisdom strenuously built up by thought, self-culture, and self-control; his judgment of his fellow men, while measured and penetrating, was eminently sympathetic. And so it came about that even in early life his personal feelings were typical feelings, and his poems representative poems. Most representative of all is *Faust*. Whether as a secluded student eager to discover the *summum bonum* in absolute knowledge, or as a man of flesh and blood turning his back in disgust on this barren pursuit and plunging into sensual pleasures in the vain hope of there finding life and happiness, *Faust* is but a mystical impersonation of a transition age — an age where science has sapped the ancient faith but is itself capable neither of regulating nor of being regulated: where religion has become a universal doubt having no practical relation to human affairs, the elementary laws of social conduct are obscured, and the individual is abandoned to himself, his good and his bad instincts alike running riot.

Of prose and style Goethe was a consummate master. In the fascinating melody of his verse, in the exquisite fitness and lucid beauty of his expressions, in his presentations so vividly realistic, yet so subtly suggestive of what is mysterious and ideal — everywhere we feel the magic hand of the poet. The sunny pastoral of *Hermann und Dorothea* and many of his ballads and minor poems are gems of art and most precious records of human feeling. In the masterpiece of *Faust* the story of the heroine is told anew in its simple beauty and with unsurpassable pathos.

From the creeds he stood aside, neither professing nor denouncing any, equally removed from negativism and hypocrisy. For religion he worshiped art and preached social wisdom. But his art was a self-culture earnestly addressing itself to important elements of human life which theology proscribed and materialism disparaged. And so, though not a religion, it served as a transition from the old to the new. It announced that to which the faith of humanity can alone give complete significance — the identity of the beautiful with the good and the true.

"Goethe," observes Madame de Staël, "should not be criticised as an author good in one kind of composition and bad in another. He rather resembles nature, which produces all and *of* all; and we can prefer in him his climate of the South to his climate of the North, without disregarding in him the talents which harmonize with these different regions of the soul." So, in whichever of these regions we encounter him, we recognize a master mind; and are compelled to agree with Carlyle that "he was the master spirit, the spokesman of his age."

SCHILLER

A. D.		AGE
1759	Born at Marbach, Württemberg,	..
1780	Surgeon in army,	21
1781	*Die Räuber*, "The Robbers,"	22
1783	Connected with Mannheim theater,	24
1787	Finished *Don Carlos* at Dresden; resided at Weimar,	28
1789	Professor of history at Jena,	30
1790	Married,	31
1792	"History of the Thirty Years' War,"	33
1799	*Wallenstein*,	40
1799–1801	*Maria Stuart; Die Jungfrau von Orleans*, "The Maid of Orleans,"	40–42
1804	*Wilhelm Tell*,	45
1805	Died at Weimar,	46

JOHANN CHRISTOPH FRIEDRICH VON SCHILLER, the great German national poet and dramatist, was born at Marbach, Württemberg, Germany, November 10, 1759, and died at Weimar, May 9, 1805. His father had been a surgeon, and afterward an ensign and captain in the Bavarian army. Before the poet was born his father had retired from the service, but was still retained in the pay of the duke of Württemberg as the inspector and superintendent of his pleasure grounds at Ludwigsburg, his principal country residence. Both the father and the mother of Schiller were persons of great probity and good sense; but it was from his mother, who was a woman of warm affection and deep piety, more particularly that he seems to have derived his poetical sensibility and taste.

Schiller's early education was subject to frequent interruption, owing to the migratory habits which the occupation of his father entailed upon the family. In his ninth year he was sent to school at Ludwigsburg, where the family were now settled; and whatever progress he may have made in scholarship, the following anecdote shows that he had begun even this early, "to muse on nature with a poet's eye." In his seventh year, having disappeared during a tremendous thunderstorm, he was found, after an anxious search, perched high on the bough of a tree, gazing at the tempestuous sky, in raptures with the beauty of the lightning, and eager "to see where it was coming from." He was at first destined for the clerical profession; but on account of the offer of the duke of Württemberg to enrol him in the ducal school which he had established at Stuttgart, and from which theology was excluded, the design was abandoned, although not without reluctance on the part both of Schiller and his parents.

At the Karlsschule at Stuttgart, which Schiller entered in his fourteenth year, the troubles of his life began. As each pupil had to choose some special study with a view to his future profession, Schiller entered first upon the study of law, which he soon afterward changed for that of medicine. Neither of these was a very congenial calling; but he might, perhaps, have reconciled himself to them, had it not been for the chilling and repulsive formalism which pervaded the whole establishment. The school was regulated on principles of the most inflexible martinetism. "The process of teaching and living," says Carlyle, "was conducted with the stiff formality of military drilling; everything went on by statute and ordinance, there was no scope for the exercise of free will, no allowance for the varieties of original structure." Here Schiller spent six cheerless and vexatious years, fretting against a system which must have been irksome to all the inmates of this house of bondage, and irksome in a tenfold degree to a youth of his ardent, impetuous, sensitive, and independent temperament.

He acquired, however, a sufficient knowledge of his profession, for in 1780 he was appointed by the duke of Württemberg to the position of surgeon in a regiment. But the whole bent of his inclinations was toward literature, so that it is probable that even his regimental practice was little more than nominal. "Schiller," says Jean Paul, "was educated for a surgeon; but fate said to him — 'No, there are deeper sores than those of the body — heal thou the deeper!' So he became a poet and author." In fact, two years before this time and while still a school boy, he had prepared a drama, in which he poured forth the pent-up passions of his life, and which ere long was to burst upon the world like a thunderbolt. This was his celebrated tragedy *Die Räuber*, "The Robbers," brought out in 1781. "In that play," says Carlyle, "he wrenched asunder his fetters with a force which was felt at the extremities of Europe"; the sensation it excited spread through the mind of Germany, as Bulwer says, "like fire through flax."

Symptoms which portended revolution had already appeared in the political atmosphere of nations; in many quarters a feeling prevailed that society and its institutions had become hollow, conventional, and antiquated. To these symptoms and feelings, "The Robbers" gave a shape and a voice, crude, indeed, and exaggerated, but vivid, impassioned, and sympathetic. The piece was in the highest degree revolutionary; not that it was directly political, but it was a daring defiance of the artificial restraints of civilization — a glowing picture of free and wild life in the woods, led by a gang of young desperadoes who had thrown off the conventions of society, and were determined to live according to the good old plan, that they should take who have the power, and they should keep who can. In a literary sense, also, it was highly revolutionary, inasmuch as it was founded on no foreign models, but was a genuine product of native German genius. As such it was hailed with very general acclamation.

The inspiration of "The Robbers" is to be found, doubtless, in the restrictions by which Schiller was hampered in the Karlsschule at Stuttgart. This work was the rebound of his mind — the form in which his elastic spirit reacted against the cramping influences of the plan. But if the drama gave him fame, it also brought him into serious trouble. Though free from the trammels of school, he was not yet beyond the ducal jurisdiction. His play was published in 1781. It gave great offense to his patron, the duke, as inconsistent both with good taste and with the duties of a regimental surgeon. It was soon afterward acted at Mannheim, and Schiller was naturally present at the performance, although without leave. The duke caused him to be arrested, and he was imprisoned for fourteen days.

How far this persecution might have been carried, it is impossible to say. But Schiller, fearing that he might be doomed to perpetual imprisonment, and having before his eyes the fate of the poet Schubart, who for offenses as venial had pined for eight years in an Austrian dungeon, resolved to escape from the dominions of Württemberg. He was invited by an old school fellow, Wilhelm von Wolzogen, to pay him a visit at Bauerbach, near Meiningen, where his mother, an admirer of the poet, resided. Here he fell in love with the daughter of his hostess, Charlotte von Wolzogen, who, however, did not reciprocate his passion; and here, too, he commenced the composition of two new dramas, *Fiesco* and *Kabale und Liebe*, "Cabal and Love." He then went to Mannheim. But Mannheim was too near Württemberg to be a safe city of refuge, so he proceeded to Frankfort and Oggersheim. His faithful companion in these wanderings was a musical friend named Streicher, whose good humor and accomplishments helped to cheer the gloom of their situation. They could muster between them at the start only about fifty florins — equal to about twenty-five dollars — and when these were expended, they were reduced to sore straits.

Meanwhile, the anger of the duke of Württemberg had subsided. Though quick tempered, he was not vindictive. He may have felt, too, that it would ill become him to persecute a man whom all Germany was uniting to honor. Accordingly, an intimation was conveyed to Schiller that he might henceforth reside where he pleased. So he returned to

Mannheim where he was appointed poet to the theater, then the most celebrated in Germany.

He settled at Mannheim in 1783. During this period he acquired, through his connection with the theater and intimacy with Meier and Dalberg, much insight into the means by which plays are best adapted for effective representation. He completed his tragedy of *Fiesco*, which, although at first not so successful as "The Robbers," obtained, after a time, a large share of popularity. This was followed by "Cabal and Love," which was also very favorably received. Both of these tragedies are deeply impressive, and eminently original. They show a marked improvement in the author's taste and knowledge of human nature since the date of "The Robbers." Though they still somewhat overstep the propriety of nature, their exaggerations are less prominent than those of his earlier composition. The first of these plays has the advantage of being historical. It represents the conspiracy by which Fiesco, a man with many noble qualities, aims at the possession of the supreme power in Genoa, and how he falls by the hand of the bigoted patriot in Verrina. The other drama, "Cabal and Love," is a tragedy of domestic life.

Schiller's fame was now assured. But his was one of those minds which are ever struggling toward perfection, and ever animated by the desire to be serviceable to their fellow creatures. He strove incessantly to improve himself in dramatic art, and to render the theater at Mannheim the instrument of a high moral purpose. He may have overestimated the power and the influence of theatrical representation; but he thought that, like the school and the pulpit, it might be made an effectual agent in the work of national instruction and civilization. To this noble end he bent all his powers during his residence at Mannheim.

Here he commenced *Don Carlos*, an historical subject of the deepest tragical interest, and one on which he has expended the finest resources of his genius. In this play there are no traces of the immaturity which marked his earlier efforts. At this time he was raised to the rank of councilor to the duchy of Weimar. In obtaining this title, which was a mere nominal dignity, his purpose, no doubt, was to strengthen his chance of securing some office, diplomatic, legal, or medical, which might yield him a less precarious livelihood than that which he was earning in the service of the muses. With this practical object in view, and being embroiled with the actors, who frequently refused to adopt his suggestions, he resolved to leave Mannheim.

Then followed another period of wandering. He first took up his abode at Leipzig, then the great meeting place of all the forces of the empire, intellectual, moral, and material. Here he made the acquaintance of Huber, the famous literary critic, and Gottfried Körner, and wrote the beautiful "Ode to Joy." His hope that he might receive some appointment in law or in medicine at Leipzig, through the influence of the duke of Weimar, was never fulfilled; and he accompanied Körner to the latter's villa near Dresden. Probably the chief motive which urged him to accompany Körner was a second unhappy love affair. While residing at Mannheim, Schiller had fallen in love with Margaret Schwann, the daughter of a bookseller. Margaret seems to have been a very attractive person, and in all respects worthy of the poet's affection and admiration. But the uncertainty of his position and prospects interposed, at the time, an insuperable bar to their union. "A bookseller," as Bulwer remarks, "is generally the last person to choose, as his son-in-law, an author. He has seen too much of the vicissitudes of an author's life, and of the airy basis of an author's hopes in the future, to be flattered by the proposals of a suitor, who finds it easier to charm the world than to pay the butcher." Hence the elder Schwann had looked rather coldly on the growing intimacy between Margaret and Schiller; and it was to overcome his scruples that the poet had bethought him of turning his abilities into a more practical channel. At this juncture he explained his intentions and prospects to Margaret's father, and made a formal proposal for her hand. But whether it was that the bookseller distrusted the business talents of the poet, or had misgivings on some other score, he refused his consent, and all intercourse between them was broken off. They met at Heidelberg many years afterward, after Margaret had married, and their emotion showed how deep and intense their early attachment had been. After this disappointment, at any rate, Schiller gave up his intention of devoting himself to a professional calling, and removed to Dresden.

At Dresden he completed *Don Carlos* in 1787, wrote "Philosophical letters between Julius and Raphael," and most of the poems which in his collected works are entitled "Poems of the second period." The "Poems of the first period" had been written some time before.

After two years in Dresden he shifted his residence to Weimar, which, though politically insignificant, was at this time the intellectual capital of Germany. Goethe, Wieland, and Herder, and many minor celebrities, were here assembled under the friendly patronage of the reigning duke and his amiable mother, the princess Amelia. In the adjacent town of Jena there were professors strong in philosophy and the sciences. Schiller came to Weimar in 1787; at first he was rather shy and constrained in his new position, but ere long he felt quite at home in a society which was polished without being stiff, and courtly without ceasing to be cordial.

While at Weimar, he met his future wife, Charlotte von Lengefeld, a woman of fine intellect and culture, whom he married in 1790 after a courtship of three years .

In the preceding year he had been appointed to the position of professor of history at the university of Jena, following the publication of his "Revolt of the Netherlands." The "History of the Thirty Years' War" was published in 1792. Both of these works show that Schiller had a genius for fact, not much inferior to his genius for fiction. Carlyle pronounced the latter the best historical performance of which Germany could boast. How he might have acquitted himself as an historical lecturer, we are not in a position to decide. His room was crowded, but his success seems to have been doubtful. His health broke down, and he had to remit the active duties of his calling before he had a sufficient trial, and even before his preparations were complete. He became seriously ill in 1791, and his health was never afterward restored, although he continued during the remaining years of his life to work out his literary projects with an unabated ardor which, not disease, but only death, could subdue.

From 1791 to 1799 Schiller resided principally at Jena, although incapacitated for the active duties of his professorship. The generous tribute of admiration which came to him from far Denmark during this period must not be passed over without notice. Two Danish nobles, the count Ernest von Schimmelmann, and the prince Christian von Holstein Augustenburg, having heard of his illness, tendered to him, with expressions of enthusiastic esteem, a pension of a thousand dollars to last for three years, in order that no means which could bring back his health might be left untried. Such munificence, so kindly offered, the poet, of course, gratefully accepted. It enabled him to face work before which even he, with all his heroism, might otherwise have succumbed. The summer house at Jena in which, during the watches of the night, and with a flask of Rhenish wine beside him "to cheer, but not inebriate," some of his finest tragedies were composed, continued long to be shown as an object of interest to travelers.

It was, indeed, during these years of pain that his genius soared to its noblest flights, and he executed his grandest achievements. In 1799 he completed *Wallenstein*, perhaps his greatest work, and regarded by many as the finest tragedy in the German language. From 1799 to 1801 — after his return to Weimar — his intimacy with Goethe exercised a most happy influence upon the productions of his genius. "The Maid of Orleans," "Mary Stuart," and "The Bride of Messina," as well as some minor poems, belong to that period. His "Song of the Bell," though properly classed as a minor poem, has never been surpassed. In it the three great events of human life — birth, marriage, and death, all marked by the ringing of the bell — are touched upon with an exquisite beauty and pathos which, had the author composed nothing else, would have secured him a place among the rare poets of the human race.

In 1804 Schiller produced *Wilhelm Tell*, the most popular of all his dramas. The same year his fatal malady — pulmonary consumption — began to tighten its grip on his frail life, and he died on May 9th of the following year.

Ever since his death the fame of Schiller has increased. He has long been recognized as next to Goethe in German literature, if not in some respects his superior. Surely as a dramatist he stands foremost among German, and among the highest of all dramatic writers. As a poet he is characterized by strong feeling and intense idealism. He possessed true nobility of soul — proof against poverty, dependence, ill health. If, indeed, the poet's mission is to present pure and elevating ideals of life, Schiller may take high rank. Freedom from oppression, temporal and spiritual; freedom from sloth, ignorance, and vice; love of the family, unity in the state, feeling for the race, benevolence in the sovereign, loyalty in the statesman, the citizen, and the friend; the courage of the warrior, the blessings of peace and ordered life; the self-sacrificing aspirations of youth, of lovers, and all ingenuous souls; the nobility of woman — these are the themes which Schiller sang with glorious vehemence, and revived for the depressed generation in which his lot was cast. Schiller's dramas were a trumpet-call to what was best and noblest around him. His verses stirred the spirit which, when the time came, was to achieve the liberation of his country, and they have justly found a lasting home in the German heart.

"The love of liberty," says Madame de Staël, "respect for the female sex, enthusiastic admiration of the fine arts, inspired his mind. Schiller was the best of friends — the best of fathers — the best of husbands; no quality was wanting to complete that gentle and peaceful character which was animated by the fire of genius alone."

SIR WALTER SCOTT, famous Scottish poet and novelist, was born in Edinburgh, Scotland, August 15, 1771. His father was a writer to the signet, or solicitor, and was descended from an old family of border freebooters. His mother, Anne Rutherford, was the daughter of one of the medical professors in the university of Edinburgh. Walter was the seventh of a family of twelve, six of whom lived to maturity, but only two, the poet and his brother Thomas, left any descendants. Before he had completed his second year Walter was attacked by a fever, which seriously impaired his health, and caused a lameness which proved permanent. He was removed soon afterward to Sandy Knowe, the farmhouse of his paternal grandfather.

At this place, close beside the ruined fortalice of Smailholm, overlooking the course of the Tweed, and an extensive tract of country studded with spots famous in border history, Scott lived until his eighth year with the exception of a few months spent at Bath. These romantic localities, and the old stories of his marauding ancestors to which he listened, produced a deep and indelible impression upon his mind. He returned to Edinburgh in 1779, with health partially restored, and was sent to the high school of that city, where he became distinguished for his courage, extraordinary memory, vast store of miscellaneous information, and his skill in storytelling, rather than for accurate scholarship.

"I left the high school," he says, "with a great quantity of general information, ill arranged, indeed, and collected without system, yet deeply impressed upon my mind, readily assorted by my power of connection and memory, and guided, if I may be permitted to say so, by a vivid and active imagination."

In the winter of 1783 he entered the university of his native city, attending only one session, with little or no apparent profit. He never understood Greek beyond the elements, and had but a loose scholarship in Latin; and the acquaintance, which he obtained in early manhood, with French, Italian, Spanish, and German, was very superficial. When he was nearly fifteen years old, he entered his father's office and studied law sedulously. For literary avocations he was making, undesignedly, full preparation, by devouring romances, novels, histories, and old plays; while he continued to distinguish himself by inventing and telling stories.

His father's intention, as well as his own, was that he should become an advocate; and

his attendance in the debating club, called the speculative society, was one of his steps of training, while it gave occasion for writing essays, exhibiting his turn for antiquarian and poetical studies. In 1792 he was admitted as a member of the Scottish faculty of advocates. In 1796 he published translations in verse of Bürger's German ballads, "Lenora," and the "Wild Huntsman"; and he contributed to Lewis's *Tales of Wonder*. In 1799 appeared his translation of Goethe's prose drama, *Götz von Berlichingen;* and in the same year he wrote, and made known to his friends, the earliest of his considerable efforts in original poetry, the ballads of *Glenfinlas, The Eve of St. John*, and *The Grey Brother*. Still he had gained no high literary reputation; nor was literary composition more than an occasional employment for him. He paid an average amount of attention to his profession, and was desirous of securing an independent livelihood from some source other than literature.

In the latter part of 1797 he married Charlotte Margaret Carpenter, the daughter of a French emigrant, whose small fortune added something to his income. His father's death next gave him a moderate patrimony; and, in 1799, the patronage of the duke of Buccleuch and Lord Melville, to whose politics he steadily and warmly adhered, bestowed on him the shrievalty of Selkirkshire, an easy office, with an annual salary of three hundred pounds. In the same year his poetical taste, both in rhyme and in diction (if not in more important matters), received a new impulse and direction from hearing unpublished poems of Wordsworth and Coleridge, especially *Christabel.*

Now, easy in circumstances and occupying a good position in society, Scott was sufficiently independent of professional labor to devote himself more and more to less uncongenial pursuits; and he gradually made authorship the main business of his life.

The brilliant period of Scott's literary career extends from 1802, when he was in his thirty-first year, to 1825, when he was in his fifty-fourth. In the first of those years he published the first and second volumes, and in the next year the third volume of the *Minstrelsy of the Scottish Border*. This publication gave him at once a distinguished reputation. The old ballads were excellently edited; the annotations showed great sagacity, good sense, and varied knowledge; and there was undeniable promise in the few ballads of his own that were inserted in the collection.

In 1802, likewise, he had begun to write what he called "a kind of romance of border-chivalry, in a light-horse-man sort of stanza." This piece, insensibly swelling in dimensions, soon became too bulky for the "minstrelsy," and was reserved to be the foundation stone of Scott's celebrity as an original poet. It was circulated among his friends, and warmly approved. It appeared at length in 1805, under the title of *The Lay of the Last Minstrel.* Its success was immediate and unexampled. The poem appeared when genuine poetry had long been unheard by the public, and it was also the first vigorous poetical narrative that had been produced in Great Britain for more than a century. But, further, it was the earliest poem which was inspired by the animation and eagerness of the age which gave it birth. The *Lay* was not, any more than its successors, the effort of a poet aiming at the highest effects of his art; but it was a work of great genius and originality; and, if inferior to some of Scott's latest poems in mechanism, and less rich in strikingly poetical passages, it was more faithful than any of them to his design, of reconstructing the chivalrous romance in a shape accommodated to modern sympathies.

Marmion, containing in its description of the battle one of the most spirited passages in the whole range of English poetry, appeared in 1808; the beautiful metrical romance of *The Lady of the Lake* in 1810; in 1811 came *The Vision of Don Roderick*, indicating a decrease of strength, which also showed itself two years later in *Rokeby;* in 1815 was published *The Lord of the Isles;* and the list of the metrical romances closed with *The Bridal of Triermain*, and *Harold the Dauntless*, published respectively in 1813 and 1817, and both of them anonymously.

In the course of this period, also, Scott edited the works of Dryden and Swift, contributed for a time to the *Edinburgh Review*, and in 1808 assisted zealously in establishing its formidable rival the *Quarterly*. He wrote also biographical and critical prefaces, and performed much other miscellaneous labor. To such work he was led by those commercial engagements which he now formed, and which exercised in the end so disastrous an influence upon his fortune.

His school fellow, James Ballantyne, having been the editor and printer of a newspaper in Roxburgshire, was assisted by Scott in setting up a printing house in Edinburgh; and the poet, after having loaned money to the firm, became really a partner in it in 1805. Not long afterward his connection with the business became yet closer. He quarreled with his publisher, Constable. He desired to obtain facilities for giving to the world literature of a higher stamp than that on which publishers are likely to venture; and, not very consistently with his desire, he entertained sanguine hopes of profit from a publishing business guided by a man of knowledge and influence like himself. Accordingly, in 1808, John Ballantyne, a brother of James, was placed at the head of a new publishing firm; but here, as in the former case, Scott was a partner to the extent of a third. All these arrangements were kept profoundly secret; in the eyes of the public, and even of his most intimate associates, Scott was merely the patron and friend of the Messrs. Ballantyne.

A few years after the formation of these partnerships, Scott entered on the second stage of his literary progress. He was one of the first to discover the waning popularity of his poetry; and he cheerfully set himself at work to regain his laurels in a new field. He wished for fame; he wished also for gain. He had long cherished the ambition of territorial possession; and this ambition he could not hope to gratify speedily from his ordinary means, though his appointment as one of the principal clerks of the court of sessions in Scotland added, from 1812, more than a thousand pounds annually to his income.

But what was ample for all prosaic needs seemed poor to his imagination with its fond and glittering dreams. Already some such vision, as at Abbotsford was afterward realized, flitted before his mind's eye, and it was the darling ambition of his heart to recreate and leave behind him in the founding of a family some image of the olden glories which were the life of his literary inspirations.

From this passion arose many of the rash adventures which finally ruined the publishing firm; hence, also, in no small degree, arose the eager industry with which, when his prose works proved so profitable, he poured forth volume after volume. In 1805, while he was engaged on *Marmion*, he had begun to write a novel. In three weeks, during the summer of 1814, he added two volumes to it, and it was published anonymously in July of that year, bearing the name of *Waverley, or 'Tis Sixty Years Since. Guy Mannering, The Antiquary, The Black Dwarf, Old Mortality, Rob Roy*, and *The Heart of Midlothian* rapidly followed. From this time onward, for some years, Scott stood on a pinnacle of fame and brilliant social distinction such as no other British man of letters had ever reached.

In 1817 he had a violent illness, which again endangered his life in 1819; but in paroxysms of agony he dictated *The Bride of Lammermoor.* His health then took a turn for the better, and *Ivanhoe* was produced. Novels continued to pour from his pen — *Kenilworth, The Pirate, St. Ronan's Well,* and others — apparently without effort, and his brilliant and fascinating romances spread his fame to the utmost limits of the civilized world.

He purchased, in 1811, a farm on the banks of the Tweed, near Melrose, built a cottage on it, and acquired land around it until he possessed a large estate, naming it Abbotsford. Here he erected a baronial castle, filled it with antiquarian relics and ornaments, planted and improved the grounds, and dispensed hospitalities of which the most distinguished men in Europe were proud to partake. In 1820 he was created a baronet; and in the following year he directed the reception to George IV. in Edinburgh.

Even before this time both firms of Ballantynes were tottering; and they were brought to the ground in the beginning of 1826, by the failure of Constable's house, with which they were deeply involved. The mortifying disclosure of Sir Walter's concealed partnership followed, of course; and his liabilities were found to amount to a sum not short of one hundred fifty thousand pounds. He acted like a man of courage, and refused to offer to the creditors any composition, or to accept from them any discharge. He pledged himself to devote the whole labor of his subsequent life to the payment of the debt.

Breaking up his establishment at Abbotsford, where the wife whom he loved lay dying, he hired a lodging in Edinburgh, and there for some years, with stern and unfaltering resolution, he toiled at his prodigious task. In 1826 he published the novel *Woodstock,* written while his pecuniary anxieties and humiliations were at their height. Afterward appeared the *Life of Napoleon,* in eight volumes, and *The Fair Maid of Perth,* with much other miscellaneous work. Within the space of two years, Scott had realized for his creditors the amazing sum of nearly forty thousand pounds. A new and annotated edition of the novels was issued with immense success, and there seemed every prospect that, within a reasonable period, Scott might again front the world, as he had pledged himself to do, not owing any man a penny. In this hope he toiled on; but the limits of endurance had been reached, and the springs of the wornout brain broke in that stress of cruel and long-continued effort. In the year 1830 he was smitten with paralysis, from which he never thoroughly rallied. It was hoped that the climate of Italy might benefit him; and by the government of the day a frigate was placed at his disposal in which to proceed thither. But in Italy he pined for the home to which he returned only to die. At Abbotsford, on the 21st of September, 1832, he died with his children around him and the murmur of the Tweed in his ears. On the 26th, he was buried beside his wife in the old abbey of Dryburgh.

Sir Walter Scott had two sons and two daughters. His eldest daughter, Sophia, married, in 1820, J. G. Lockhart, Scott's famous biographer. The eldest son, Walter, entered the British army, and on the death of his father inherited his title.

It is one of the most melancholy thoughts in the history of English literature that Scott was prematurely sacrificed. With his splendid constitution and amazing fertility, the world might have possessed another series of romances from his brain not less inimitable than those we have. Some of his happiest creations have not been surpassed in their own vein by Shakespeare himself; some of his truest scenes have Homeric simplicity and charm; his best tales have refashioned the historic judgment of our age. No writer ever exercised a greater influence over the public mind, or led to so much conscious or unconscious imitation. His writings never foster a bad or throw ridicule on a good or generous feeling.

If we look at the variety and richness of his gallery, at his command over pathos and terror, the laughter, and the tears; at the many large interests besides those of romance which he realizes to us; at the way in which he paints the whole life of men — not their humors and passions alone; at his unfailing wholesomeness and freshness, like the sea and the air and the elementary forces of nature; it may be pronounced a just estimate which places Scott second only to Shakespeare in English creative and imaginative literature. "All is great in the Waverley novels," says Goethe, in 1831, "material, effect, characters, execution!"

These inexhaustible prose epics paint in everlasting hues the best types of mediæval chivalry, and those late echoes of it which linger in the northern hills. And Scott does this with a systematic completeness and a passionate enthusiasm which have not been reached by the greatest masters of the historical drama.

But Scott's name does not rest on his fiction. He was the poet as well as the chronicler of his native land. He revived the scenes of history, gave life to the departed of earlier times, and threw over all the mantle of natural reality. The following stanzas from *The Lady of the Lake* might even pass as his own requiem:

Harp of the North, farewell! the hills grow dark,
  On purple peaks a deeper shade descending;
In twilight copse the glowworm lights her spark,
  The deer, half seen, are to the covert wending —
Yet, once again, farewell, thou minstrel harp!

Receding now the dying numbers ring
  Fainter and fainter down the rugged dell,
And now the mountain breezes scarcely bring
  A wandering witch-note of the distant spell —
  And now 'tis silent all! — enchanter, fare thee well.

"Scott," says Lord John Russell, "is the other wonder of this age. Picturesque, interesting, and bardlike as are his narrative poems, the pathos, humor, description, character, and, above all, the marvelous fertility displayed in the novels, show far greater power: a whole region of the territory of the imagination is occupied by this extraordinary man alone and unapproachable."

The greatness of Scott's heart, the loyal affection and kindness of his nature, are at least as remarkable as his astonishing genius. Nor was he less sagacious, in all affairs but his own, than he was sympathetic. As a man of letters he was more than generous. Far from being envious, he admired contemporaries in whom the judgment of posterity has seen little to approve. He cared for the poor with a wise beneficence. In his writings there is no private scandal, no personal satire, no bribe to human frailty, no libel upon human nature. And, in an important sense, he was the greatest of peaceful and beneficent conquerors in the world of letters.

WILLIAM WORDSWORTH, an illustrious English poet, was born at Cockermouth, in Cumberland, England, April 7, 1770. He was the second son of John Wordsworth, an attorney, and agent of the estates of Lord Lonsdale and Anne Cookson. There were five children in his father's family, and Dorothy, the only daughter, was his most cherished friend and confidant during his life. His mother died in William's ninth year; and his father died five years afterward, leaving his children little fortune beyond a claim on Sir James Lowther, afterward earl of Lonsdale. This debt remained unsatisfied until 1802, when, on the accession of the next earl, eighty-five hundred pounds were paid to the Wordsworth heirs.

William was first sent to school at Penrith, where his parents had gone to reside, and subsequently he was transferred to the endowed school at Hawkshead, in Lancashire, where he remained until 1787, when he was sent by his uncles to St. John's college, Cambridge. He had read much in boyhood, especially poetry, and had written English verses in imitation of Pope's versification, and a little in his style. One of these compositions presaged two of the most prominent features in the character of his mind. "It was," says he, "a long poem, running upon my own adventures, and the scenery of the country in which I was brought up." The only considerable poem which he wrote while at the university was *An Evening Walk*. His vacations were devoted to wanderings in the country; and in the autumn of 1790 he spent nearly three months in a tour on the continent, visiting France, Switzerland, some of the Italian lakes, and the Rhine.

He disliked the system of the university, and attended little to the studies of the place. Indeed, it is to be observed that through life Wordsworth was as little a student of books as any literary man of his eminence ever was. Except in poetical literature, his knowledge of books seems always to have been very slight. And if he was disinclined to read, he was quite as much disinclined to writing; he had weak eyes and great indolence. He has himself said that, if he had been free to choose his course of life, he would have spent his days in traveling. To the adoption of a profession he was never able to make up his mind. The church was proposed to him, but speedily rejected. His religious belief was never such as to prevent his taking clerical orders; but his opinions on the state of society, during his early manhood, would not easily have been reconcilable with the position of a clergyman in the church of England. For several years after the outbreak of the French revolution, he was an ardent republican. In 1791 he took his degree of B. A., and quitted Cambridge.

At the close of the year Wordsworth again went to France, where he spent nearly twelve months. France was then in the early fervors of the great revolution, and its aims seem to have won his sympathetic and passionate support. He cultivated relations of a somewhat intimate kind with the Girondist party, which in the end might have seriously compromised him had not his pecuniary circumstances compelled him to return to England some little time before his French friends were sent in a body to the scaffold. In 1793 he found his way to London.

While in France he wrote the poem called *Descriptive Sketches*, which betrays, yet more than *An Evening Walk*, the poetic strength with which he was endowed. These pieces were published in 1793. In that year, also, *The Female Vagrant* was written. His pecuniary circumstances at this period were distressing. For some years he wandered about, gradually satisfying himself that he was justified in regarding poetry as his true vocation. He planned a monthly miscellany, which was to have been "republican but not revolutionary"; and he attempted to find employment in writing his particular political views for the London newspapers.

In 1795 he received a legacy from his friend and contemporary, Raisley Calvert. An intimate friend of the poet, the latter had formed a high opinion of his genius; and at his early death in the year mentioned, he was found to have bequeathed to Wordsworth the sum of nine hundred pounds, expressly that leisure might for some years be allowed for the undisturbed development of his powers. Seldom has money been better bestowed; and small as the sum may seem, to a man of the poet's simple tastes and entire singleness of aim, it enabled him to devote himself to study until the settlement of his father's affairs.

In the autumn of that year Wordsworth took a house with his sister, their first residence being at Racedown, in Dorsetshire. He commenced, but abandoned, a poetical imitation of Juvenal; and in this year and the following he made his first and last attempt at a kind of poetry very uncongenial to the cast of his genius, by writing the tragedy of *The Borderers.* Refused at Covent Garden, this piece remained in manuscript for nearly half a century. About this time, likewise, were written a number of the earliest of those fine passages, which were afterward dovetailed into *The Excursion.* This is a fact particularly deserving attention. The poet's blank verse compositions, with their solemn tone of meditation, their purely dignified action, and their sweep of rotund melody, were known to the world only when he had passed middle age; and they were treated by his critics as the fruits of improved skill and enlarged experience and purified taste. But he actually had at his command, and continued to give expression to this highest mood of his poetry, from his twenty-fifth year.

In 1797 he moved to Alfoxden, in Somersetshire, in order to be near Coleridge, whose acquaintance he had made in Dorsetshire. Out of the intimacy thus begun came the famous *Lyrical Ballads,* published as a joint venture of the two poets. These were but coldly received; but probably no man ever lived more serenely self-appreciated than Wordsworth, and he did not allow himself to be disheartened by the seeming neglect of the world, or the hostility of critics. "Possibly from some want of judgment in punishments inflicted," he says, "I had become perverse and obstinate in defying chastisement, and rather proud of it than otherwise."

At this time, indeed, as it has been remarked by his nephew, the whole tenor of his opinions led him to dissatisfaction with things existing; and his political creed — perhaps in part through the shock which events on the continent were beginning to give to it — affected his creed in literature. He perceived with great clearness two or three deep-rooted faults in the recent poets of England; the artificial stamp of their diction; their general inattention to external nature; their want of sympathy with ordinary events and with the feelings of mankind at large. He felt that he possessed the power of producing poetry in which these faults should be avoided. It was but natural, then, that the poems with which he chose to make his first efforts toward the reformation of the public taste should contain some false canons that could be easily turned into hostile criticism.

The poet was now in his twenty-ninth year; and with his sister and Coleridge he went to Germany. The party separating, Miss Wordsworth and her brother spent the winter of 1798-99 very uncomfortably, and seemingly with little advantage of any kind, at Goslar, in Hanover. Here were written several beautiful pieces, among which were *Lucy Gray,* and the fragments of blank verse beginning "There was a boy" and "Wisdom and Spirit of the Universe." A beginning was also made with that first part of the great poem which Wordsworth's friends entitled *The Prelude.*

He now returned to his native Cumberland which he never again permanently left. In the end of 1799 he settled with his sister in a small house at Grasmere, which he continued to occupy for eight years. In 1800 were written *The Brothers, The Pet Lamb, Ruth, Michael,* and *Hart-leap Well;* and, in the close of the year, these and other poems made up a second volume of the *Lyrical Ballads,* which appeared with a reprint of the first. To 1802 belong, among other pieces, *The Rainbow, The Leechgatherer, Alice Fell, Intimations of Immortality,* and the two sonnets on *Buonaparte.* Then, also, Wordsworth was working on *The Excursion,* which at that time bore the name of *The Pedlar.* In that year he married Mary Hutchinson of Penrith, to whose amiability his poems pay warm and beautiful tributes. In 1803 he made a tour of some weeks in

Scotland and was received at Melrose by Sir Walter Scott; and he now became acquainted with Sir George Beaumont, whose name appears often in his writings.

In 1805 he suffered the grief of losing his brother, Captain Wordsworth, who perished by shipwreck. In this year were written *The Waggoner* and the *Ode to Duty;* and *The Prelude* was finished and consigned to the poet's desk for forty-five years. In 1807 two volumes of poems were printed, composed since 1800. They contain, besides several very fine ballads and many other small poems, *Sonnets Dedicated to Liberty,* and the *Memorials of a Tour in Scotland.* These volumes were severely criticised by Lord Jeffrey and other critics, who designated Wordsworth, Coleridge, and Southey as the "lake school of poets," because they lived in the English lake district and described the scenery of that beautiful region.

In 1808 he removed to Allan Bank at the head of Grasmere lake where he lived for three years. In 1809 he contributed to the *Friend* of Coleridge, who was then living with him; and published his indignant and very eloquent pamphlet on the convention of Cintra. His political opinions had now settled pretty much into the form in which they were afterward held, a kind of speculative toryism, heightened by his church opinions, but balanced by many notions really dramatic. In 1810 he printed, as an introduction to a set of views of the English lake district, his *Observations on the Scenery of the Lakes,* the most interesting of all things of that sort. In the spring of 1813, after one temporary change of dwelling, he removed with his wife, sister, and three children, to Rydal Mount, two miles from Grasmere, which was his home for thirty-seven years, and the scene of his death. Then, too, by the interest of Lord Lonsdale, he was appointed distributor of stamps for Westmoreland — an office which was executed by a clerk, and yielded about five hundred pounds a year.

A second tour in Scotland early in 1814 gave birth to a few poems; and in the summer was published *The Excursion,* one of his most famous poems, the greater part of which had been written at Allan Bank. This didactic poem contains episodes of great beauty, pathos, and grandeur; and, if judged by its best passages, hardly any poem in the English language is equal to it. Some of its scenes, extending through hundreds of lines; many passages of smaller extent, but yet considerable; and innumerable verses, phrases, and words — are among the most exquisite things to which any poetic mind ever gave expression. In 1815 appeared *The White Doe of Rylstone,* a work instinct with a dreamy loveliness and estimated by its author very highly.

Within a year or two before and after the publication of this work, the poet, in his usual fashion, proved his power of poetizing in a different key, by composing several of those small pieces, whose elaborate refinement, both of sentiment and of diction, has drawn forth the lively admiration of readers the most adverse to the peculiarities of his system. Such were *Laodamia*, *Dion*, the *Ode to Lycoris*, and *Artegal* and *Elidure*. In 1816 was composed the *Thanksgiving Ode,* and a rhymed translation of three books of the *Æneid.* In 1819 appeared in print *Peter Bell,* which was fairly popular, and *The Waggoner,* which was much the reverse. To that year belong the series of sonnets on the river Duddon. In 1820 Wordsworth, with his wife and sister, made a tour of four months on the continent, of which *Memorials* were published some time afterward. In that year, too, a visit to Sir George Beaumont gave occasion to the very fine series of sonnets called *Ecclesiastical Sketches.*

Wordsworth was now fifty years old, had written all his best works, and had laid most of them before the world. But, though the thirty years during which his life was still prolonged were unprolific of great performances, they witnessed very extraordinary changes in the reputation of the author. Poets were already familiar with his works, and acknowledged him as the chief in a new development of the art; but ordinary readers, taking what they found in the periodicals, knew as yet only a few of his best passages and a great many of his worst. For a good many years before his death, Wordsworth was not only acknowledged, and justly, to be really the greatest English poet of his time, but was regarded with a reverence allowing no possibility of faults. Symptoms of a wiser and more discriminating judgment have shown themselves since; and the world has estimated justly and correctly the works of one of the greatest, as well as the purest and most blameless, of the poets who have enriched and enlarged the domain of English literature.

The period extending from Wordsworth's fiftieth year to his eightieth requires no minute notice. He lived among his beloved mountains, traveled much, suffered a good deal, and wrote little. Two visits to Scotland, during the former of which, in 1831, he saw Sir Walter Scott just before he left Abbotsford for the last time, provided many of the materials for a volume, published in 1835, *Yarrow Revisited, and other Poems*. The finest of these are the meditative pieces entitled *Evening Voluntaries*.

About this time the poet was deeply affected by political events; and he felt yet more keenly the declining health of his sister, who became a confirmed invalid. In 1837 he made for nearly six months a tour in Italy, which suggested several pieces printed in 1842 in a volume called *Poems, chiefly of Early and Late Years*. In it was inserted the tragedy of *The Borderers*. In 1839 the university of Oxford conferred upon him its honorary degree of D. C. L. Three years later, being now seventy-two years of age, he received from the government, under Sir Robert Peel, a pension of three hundred pounds a year. In 1843, on the death of Southey, the same ministry appointed Wordsworth to be poet laureate, an office which he accepted only on the assurance that it was to be entirely honorary and nominal.

Two years later he met Tennyson whom he characterized as "the first of living English poets." In 1847 he had to witness the death of his only daughter, Dora — the accomplished Mrs. Quillinan — and he himself, in great tranquillity, died on April 23, 1850. His remains rest in the churchyard at Grasmere.

Wordsworth has been characterized by some as the "high priest of nature," and by others as the "poet of humanity." There is abundant evidence that he was both. By remanding it to truth and simplicity of natural feeling as its basis, he did more than any other writer of his time to forward the great revival of English poetry which distinguished the opening of the nineteenth century. But he was scarcely the originator of the movement. The influence was, so to speak, "in the air." Already Cowper in England, as in Scotland Burns, had preluded to the melodious outburst which was to follow; and to the last of these more particularly, as his early guide and exemplar, Wordsworth had expressly recorded his obligations in a stanza which for a long time escaped notice:

> "I mourned with thousands, but as one
> More deeply grieved, for *he* was gone
> Whose light I hailed when first it shone,
> And shewed my youth
> How verse may build a princely throne
> On humble truth."

With the charm of natural simplicity of manner, which he shared in common with these his predecessors, Wordsworth, however, combined a depth of philosophic meditation peculiarly his own. There was born with him, moreover, a passionate susceptibility to effects of beauty in the material world, such as few men can ever have been gifted with; and out of these blended elements arose that mystical communion with nature which pervades the whole body of his poetry, and constitutes its truest claim to originality. By diffusion of this, and otherwise, his influence on subsequent English poetry has perhaps been as profound as any of the kind ever exercised, and it has been almost wholly beneficial.

William Ellery Channing, in his fine appreciation of Wordsworth, speaks as follows:

"The great poet of our times, Wordsworth — one of the few who are to live — has gone to common life, to the feelings of our universal nature, to the obscure and neglected portions of society, for beautiful and touching themes. Nor ought it to be said that he has shed over these the charms of his genius, as if in themselves they had nothing grand or lovely. Genius is not a creator, in the sense of fancying or feigning what does not exist. Its distinction is to discern more of truth than common minds. It sees under disguises and humble forms everlasting beauty.

"This it is the prerogative of Wordsworth to discern and reveal in the ordinary walks of life, in the common human heart. He has revealed the loveliness of the primitive feelings, of the universal affections of the human soul. The grand truth which pervades his poetry is that the beautiful is not confined to the rare, the new, the distant — to scenery and modes of life open only to the few; but that it is poured forth profusely on the common earth and sky, that it gleams from the loneliest flower, that it lights up the humblest sphere, that the sweetest affections lodge in lowly hearts, that there is sacredness, dignity, and loveliness in lives which few eyes rest on — that, even in the absence of all intellectual culture, the domestic relations can quietly nourish that disinterestedness which is the element of all greatness, and without which intellectual power is a splendid deformity.

"Wordsworth is the poet of humanity; he teaches reverence for our universal nature; he breaks down the factitious barriers between human hearts."

What Wordsworth does is to assuage, to reconcile, to fortify. He has not Shakespeare's richness and vast compass, nor Milton's sublime and unflagging strength, nor Dante's severe, vivid, ardent force of vision. Probably he is too deficient in clear beauty of form and in concentrated power to be classed among these great giants. We can not be sure. We may leave it to the ages to decide. But Wordsworth, at any rate, by his secret of bringing the infinite into common life, as he evokes it out of common life, has the skill to lead us, so long as we yield ourselves to his influence, into inner moods of settled peace, to touch "the depth and not the tumult of the soul"; to give us quietness, strength, steadfastness, and purpose, whether to do or to endure. All art or poetry that has the effect of settled peace, and strongly confirming their judgment and their will for good — whatever limitations may be found besides, however prosaic may be some or much of the detail — is great art and noble poetry, and the creator of it will always hold, as Wordsworth holds, a sovereign title to the reverence and gratitude of mankind.

BALZAC

A. D.		AGE

1845–50	*Les Parents Pauvres (La Cousine Bette; Le Cousin Pons;* and *Les Paysans*),	46–51
1850	Married; died at Paris,	51

HONORÉ DE BALZAC, celebrated French novelist, and founder of the realistic school of fiction, was born at Tours, France, May 16, 1799, where his father held a civil office. His private history, which may be traced through many pages of his novels, was a strange and not a happy one.

When but twelve years of age he was sent from his home in Tours to the college of Vendôme, about a score of miles from Blois. Here he neglected the studies and sports of childhood to bury himself in mystic books and mystic reveries. In *Louis Lambert* he tells the story of his school life — among other things, how he composed an essay on aviation, in which he proposed a theory to complete the works of Mesmer, Lavater, Gall, and Bichat. His promising treatise was burned by one of the masters of the school; and Balzac, falling into ill health, returned home.

The next stage in his education was a course of study at the Sorbonne, Paris, consisting of lectures on law. Then his father placed him with a notary to whom he acted as clerk. In such offices he picked up his knowledge of the byways of chicanery, which he uses only too freely in his romances. Nature did not mean Balzac for an advocate. His occupation proved intolerably irksome; and he was constant in his belief in his own genius — a belief which for many years he had all to himself — and his family left him to work and starve, on the scantiest pittance, in a garret of the Rue Lesdiguieres. From about 1819 there followed ten years of hard toil, poverty, experiments in this and that way of getting a living. These struggles are described in *Facino Cane*, in *La Peau de Chagrin*, and in a series of letters to the author's sister, Madame de Surville. Balzac found "three sous for bread, two for milk, and three for firing" sufficient to keep him alive, while he devoured books in the library of the arsenal, copied out his notes at night, and then wandered for hours among the scenes of nocturnal Paris. "Your brother," he writes to Madame de Surville, "is already nourished like a great man — he is dying of hunger."

He tried to make money by scribbling many volumes of novels without promise, under assumed names, and borrowed funds to speculate in the business of printing. In the year 1826 he formed a partnership with the printer Barbier, and published various works; but the business in general turned out ill, and he contracted a heavy burden of debt that harassed him until the end of his career. But his perseverance was admirable. Although long utterly unsuccessful, he continued to write on until at last he opened a path for himself by his novel, *Les Derniers Chouans*, "The Last Chouans," in which he abandoned, for the first time, the manner of treatment which characterized his former writings. This novel was published in 1829. He was now appreciated, and with the appreciation ought to have come wealth. His next works, *La Physiologie du Mariage*, "The Physiology of Marriage," and *La Peau de Chagrin*, "The Ass's Skin," produced in 1830, were also very successful. The latter was a marvelous interweaving of the supernatural into modern life, and it was followed by a series of novels and tales entitled *La Comédie Humaine*, intended as a complete picture of modern civilization.

All ranks, professions, arts, trades, all phases of manners in town and country, were to be represented in his imaginary system of things. In attempting to carry out this immense, if not impossible design, he produced what is almost a literature in itself. The stories composing *La Comédie Humaine* are classified as *Scènes de la Vie Privée, de la Vie Parisienne, de la Vie Politique, de la Vie Militaire*, etc. (Scenes from private life, Parisian life, political life, military life.) These were produced between the years 1831 and 1850 — the period of Balzac's most intense application — and the masterpieces among them are probably *Le Père Goriot*, and *César Birotteau*, published in 1835 and 1838, respectively.

Balzac's later productions, which also took the form of a series under the title of *Les Parents Pauvres*, were among his best. *La Cousine Bette*, *Le Cousin Pons*, and *Les Paysans* have in our day reached a popularity scarcely second to *Le Père Goriot*, and *Eugénie Grandet*. The dramatic pieces of Balzac were not received with favor, and are far inferior to the novels of the second and third periods of his career. The *Contes Drôlatiques*, a series of gross stories in the vein of Rabelais, stand by themselves, and are not to be classed with his more pretentious efforts.

One of the chief things to be noted in connection with Balzac is his phenomenal industry and productiveness. He represents himself as working regularly fifteen and even eighteen hours a day. He wrote eighty-five novels in twenty years, and the whole of his work was that of a fastidious writer. He was prodigal of his money as of his labor, though his yearly income rarely exceeded twelve thousand francs. He would shut himself up for months and see no one but his printer; and then for months he would disappear and dissipate his gains in some mysterious hiding-place of his own, or in hurried traveling to Venice, Vienna, or St. Petersburg. As a child he had been a man in thought and learning; as a man he was a child in caprice and extravagance. His imagination, the intense power with which he constructed new combinations of the literal facts which he observed, was like the demon which tormented the magician with incessant demands for more tasks to do.

When he was not working at *La Comédie Humaine*, his fancy was still busy with its characters; he existed in an ideal world, where some accident was always to put him in possession of riches beyond the dream of avarice. Meantime, he squandered all the money that could be rescued from his creditors on sumptuous apparel, jewels, porcelain, and pictures. His excesses of labor, his sleepless nights, his abuse of coffee undermined his seemingly indestructible health. At length, in 1849, he traveled to Poland to visit Countess Hanska, a rich Polish lady, with whom he had corresponded for more than fifteen years, and to whom he had dedicated his novel, *Seraphita*. In 1850 she became his wife, the famous debts were paid, the visionary house was built and furnished, and then, "when the house was ready, death entered." Three months after his marriage, August 18, 1850, he died of hypertrophy of the heart. He was then at the height of his fame, and at the beginning, as it seemed, of the period of rest to which he had always looked forward.

During his later years he had lived principally in his villa at Sèvres; but almost the whole of literary Paris was present at his funeral. Victor Hugo pronounced a glowing eulogy over his grave.

The name of Balzac is perhaps the greatest in the literature of France since the era of the revolution. His life corresponds with the period of the rise, zenith, and decline of the French romantic school. He was inspired by many of the influences that animated Victor Hugo and his followers. Like them he was occupied by the study of the fantastic element in mediæval art; and like them he reproduced the remoter phases of life and passion, and thought that few subjects were so base or obscure as to be unworthy of artistic treatment. His creations scale every height and sound every depth of human character — from the purity of the mysterious Seraphitus Serphita, cold and strange, like the peaks of her northern Alps, to the loathsome sins of the Marnefs, whose deeds should find no calendar but that of everlasting execration.

He was never successful in reproducing the past. He was essentially the man of his own day, and *La Comédie Humaine* is as much the picture of the nineteenth, as the *Divina Commedia* is of the thirteenth century. The passions that move his characters are the intense desire of boundless wealth, of luxury, of social distinction; and though his financiers, his journalists, his political intriguers, his sordid peasantry, are relieved by the introduction of pure figures, like Eugénie Grandet, or David, or Eve, there are many elaborate studies of creatures sunk below the surface of humanity, the embodiments of infinite meanness and nameless sin. He was merely "the secretary of society," he said, and "drew up the inventory of vices and virtues." His ambition was "by infinite patience and courage, to compose for the France of the nineteenth century that history of morals which the old civilizations of Rome, Athens, Memphis, and India have left untold."

In consequence of this aim, and its execution in his *Comédie*, both Balzac and his works have often been misjudged. In person, as, indeed, in most ways, he was a typical Frenchman. From his portraits there would seem to have been more force and address than distinction or refinement in his appearance. But it must be remembered that his period was one ungrateful to the iconographer. In private life he has been held up as a self-centered egotist, who cared for nothing but himself and his own work, in which he took the foibles and vices of mankind for his subjects, and who either left goodness and virtue out of sight altogether, or represented them as the qualities of fools.

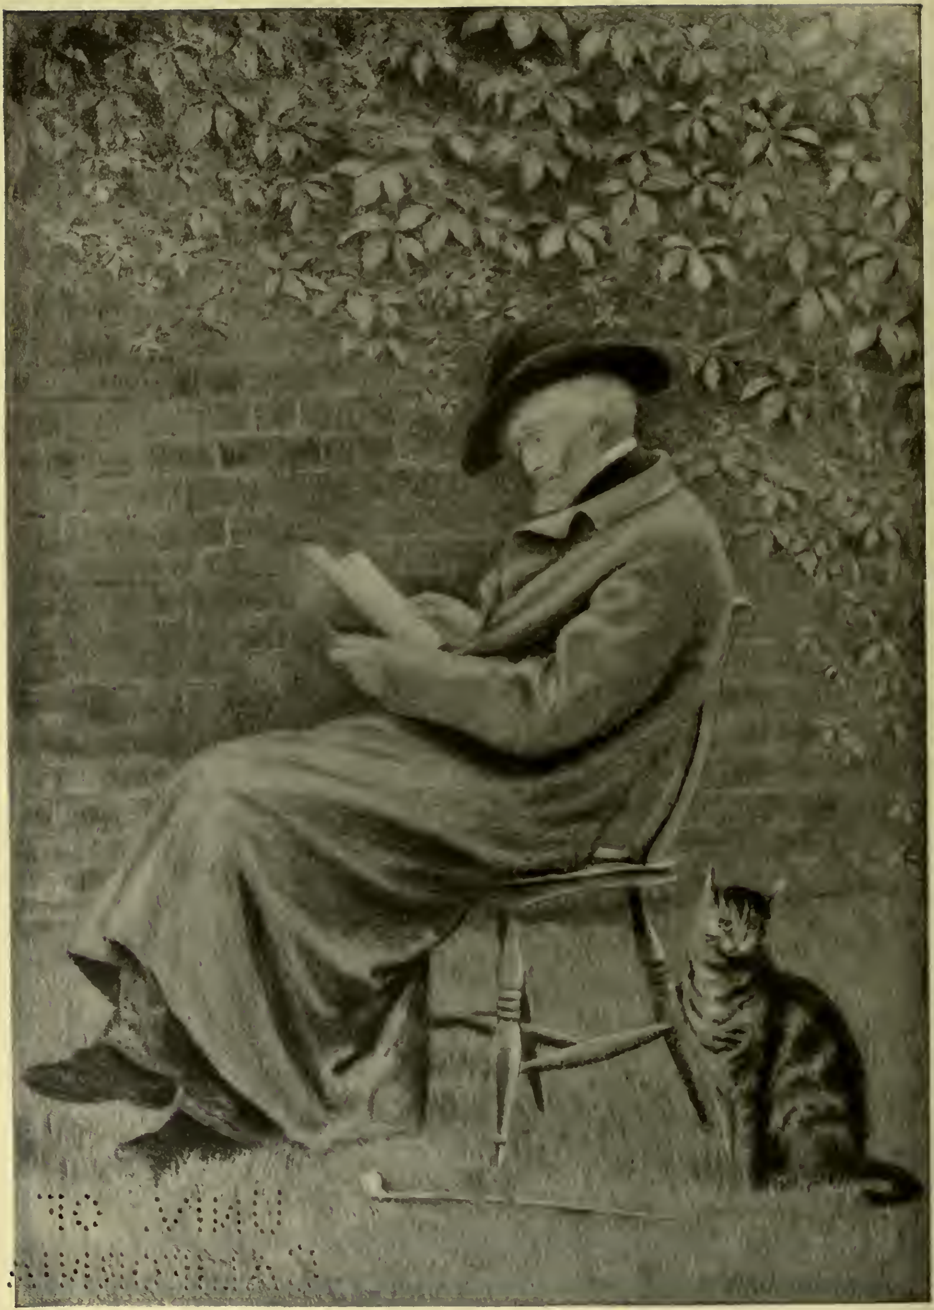
The fact is that the charge is not worth answering, although Balzac, on different occasions, rather vainly endeavored to grapple with it, once drawing up an elaborate list of his virtuous and vicious women, and showing that the former outnumbered the latter; and, again, laboring (with that curious lack of humor which distinguishes all Frenchmen but a very few, and distinguished him eminently) to show that though no doubt it is very difficult to make virtuous persons interesting, he, Honoré de Balzac, had attempted it, and succeeded in it, on a quite surprising number of occasions. The simple truth is that Balzac is not, indeed, a Shakespeare, or a Dante, or even a Scott in his analysis of mankind; but we may be very well satisfied with him as a Fielding, a Thackeray, a Dickens, or a Balzac.

Self-centered and self-absorbed Balzac no doubt was; he could not have lived his life or produced his work if he had not had the independence as well as the isolation of the self-centered. But he never sponged or fawned on a great man, or wronged others of what was due them. The only really unpleasant thing about him, perhaps due to ignorance of all sides of the matter, is a slight touch of snobbishness now and then, especially in those late letters from Vierzschovnia to Madame de Balzac and Madame de Surville, in which, while inundating his mother and sister with commissions and requests for service, he points out to them what great people the Hanskas and Mniszechs are, what infinite honor and profit it will be to be connected with them, and how desirable it is to keep struggling engineer brothers-in-law and ne'er-do-well brothers in the colonies out of sight lest they should disgust the magnates.

But these petty personal blemishes, whatever they may have to do with Balzac the man, have nothing to do with Balzac the writer. With him as with some others, but not as with the larger number, the sense of greatness increases the longer and the more fully he is studied. He resembles Goethe more than any other man of letters — certainly more than any other of the present century — in having done work which is very frequently, if not even commonly, faulty, and in yet requiring that his work shall be known as a whole. His appeal is cumulative; it repeats itself on each occasion with a slight difference, and though there may now and then be the same faults to be noticed, they are almost invariably accompanied, not merely by the same, but by fresh merits.

But the greatest thing about Balzac is the immensity of his imaginative achievements, the huge space that he has filled for us with vivid creation, the range of amusement, of instruction, of (after a fashion) edification, which he has thrown open for us to walk in.

UNIV. OF
CALIFORNIA



THOMAS CARLYLE
From the painting by Mrs. Allingham

In mere bulk the *Comédie* probably, if not certainly, exceeds the production of any novelist of the first class in any kind of fiction except Dumas, and with Dumas, for various and well-known reasons, there is no possibility of comparing it. All others yield in bulk; all in a certain concentration and intensity; none even aims at anything like the same system and completeness. In its dimensions, Balzac has built up a work of art which answers to a mediæval cathedral. There are subterranean places, haunted by the Vautrins and *filles aux yeux d'or;* there are the seats of money changers, where the Nucingens sit at the receipt of custom; there is the broad platform of everyday life, where the journalists intrigue, where life is sold for hire, where splendors and miseries abound, where the peasants cheat their lords; where women betray their husbands; there are the shrines where pious ladies pass saintly days; there are the dizzy heights of thought and rapture, whence falls a ray from the supernal light of the *Contes Drôlatiques.* Through all swells, like the organ tone, the ground note and mingled murmur of Parisian life. The qualities of Balzac are his extraordinary range of knowledge, observation, sympathy, his steadfast determination to drag every line and shadow of his subject, his keen analysis of character and conduct. His defects are an over-insistence on detail, which hampers and bewilders rather than aids the imagination of his readers; and his fondness for dwelling on the morbid pathology of human nature.

It must be remembered that, owing to shortness of life, lateness of beginning, and the diversion of the author to other work, the *Comédie* is the production, and not the sole production, of some seventeen or eighteen years at most. Not a volume of it, for all that, failed to reach the completest perfection in form and style, or can be accused of thinness, of scamped work, of mere repetition, of mere cobbling up. Every one bears the marks of steady and ferocious labor, as well as of the genius which had at last come where it had been so earnestly called and had never gone away again.

It is possible to overpraise Balzac in parts or to mispraise him as a whole. But as long as inappropriate and superfluous comparisons are avoided and his own excellence recognized and appreciated, it is hardly possible to overestimate that excellence in itself and for itself. It is impossible to judge justly any one of his tales separately, because each is only a fragment in the development of the immense *La Comédie Humaine.* Balzac holds a more distinct and supreme place in French fiction than perhaps any other author holds in the same field of art.

1874	Received the Prussian order of merit,	79
1881	Died at London,	86

THOMAS CARLYLE, eminent British essayist, historian, and philosopher, was born at Ecclefechan, a small village in Dumfriesshire, Scotland, December 4, 1795. He was the son of a stonemason, of independent character and excellent mental powers, and in prosperous circumstances. His mother was Margaret Aitken, who, according to her son's opinion, was "a woman of the fairest descent — that of the pious, the just, and the wise." These parents of a large family — ten children in all, five sons and five daughters — gave such of their sons as showed an aptitude for culture an excellent Scottish education.

Thomas seems to have been taught his letters and elementary reading by his mother, and arithmetic by his father. His home teaching was supplemented by attendance at the Ecclefechan school, where he was "reported complete in English" at about seven, made satisfactory progress in arithmetic, and took to Latin with enthusiasm. Thence he proceeded in 1805 to Annan academy, where he learned to read Latin and French fluently, "some geometry, algebra, arithmetic thoroughly well, vague outlines of geography, Greek to the extent of the alphabet mainly." His first two years at Annan academy were among the most miserable in his life, from his being bullied by some of his fellow pupils, whom he describes as "coarse, unguided, tyrannous cubs." But he "revolted against them and gave them shake for shake."

In his third year Carlyle had his first glimpse of Edward Irving, who was five years his senior, and had been a pupil at Annan academy, but was then attending Edinburgh university. In November, 1809, Carlyle himself entered that university — traveling on foot all the way, one hundred miles, between Ecclefechan and the Scottish capital. Except in one department, Carlyle's college record was not remarkable. In "the classical field," he describes himself, "truly as nothing"; and he learned to read Homer in the original with difficulty. He preferred Homer and Æschylus to all other classical authors, found Tacitus and Vergil "really interesting," Horace "egotistical," and Cicero "a windy person and a weariness." Nor did he take much to metaphysics or moral philosophy. In geometry, however, he excelled, perhaps because his professor in that subject "alone of my professors had some genius in his business, and awoke a certain enthusiasm in me." But even in the mathematical class he took no prize.

In 1813 Carlyle's academic course in Edinburgh university came to an end, and he began formal though fitful preparation for the ministry of the church of Scotland by enrolling himself, in the same year, as a student at its Divinity hall. In the summer of 1814 he competed successfully at Dumfries for the mathematical mastership of Annan academy. The post was worth only between sixty and seventy pounds a year; but it enabled Carlyle, who was as frugal as his parents, to relieve his father of the expense of his support and to save a few pounds.

Meanwhile he had read widely, and wrote of his reading at great length, and with considerable power of satiric characterization, to some of his college friends. But he found himself "abundantly lonesome, uncomfortable, and out of place" in Annan, and from the first disliked teaching; while his "sentiments on the clerical profession" were "mostly of the unfavorable kind."

In 1816 he accepted a place as assistant at the parish school of Kirkcaldy; but before long the work of teaching became intolerable, and at the end of 1818 he removed to Edinburgh. By this time he had entirely abandoned his intention of entering the ministry, and his prospects for some time were very much beclouded. He even entertained the thought of coming to America. Ultimately, however, he turned to private teaching which yielded him a fairly regular income. He also wrote some articles, chiefly biographical and geographical, for the *Edinburgh Encyclopædia*, and subsequently translated Legendre's *Elements de Géométrie* from the French.

In 1819 he began the study of law in the university, but soon found it as uncongenial as theology. Until 1822 he lived in various lodgings in Edinburgh, finding his chief relief from tutorial drudgery in visits to his parents in Dumfriesshire. His health, which had suffered from too close application to study, was at times "most miserable"; he "was in a low fever for two weeks," was harassed by sleeplessness, and began to be tortured by his lifelong foe, dyspepsia. At the same time his mind was perplexed with doubt on religious matters, regarding which he seems to have unburdened himself solely to his friend Irving. For a period he was "totally irreligious," he says. This struggle terminated in June, 1821, "all at once," when he was walking along Leith Walk, Edinburgh, in what he regarded as his "spiritual new birth." He was now absorbed in German literature, especially the writings of Schiller and Goethe; and the latter, indeed, had a more abiding influence on him than any other author.

In June, 1821, occurred his introduction, through Edward Irving, to Jane Baillie Welsh, only daughter of Dr. John Welsh, a physician of Haddington, who had died two years before, leaving his daughter sole heiress of the small estate of Craigenputtoch, some sixteen miles from the town of Dumfries. Miss Welsh, who was descended through her father from John Knox, was then living in Haddington with her mother, who claimed kindred with the patriot Wallace, and, according to Carlyle, "narrowly missed being a woman of genius." Miss Welsh had been the private pupil of Irving when he was a teacher in Haddington, and the result of the acquaintance thus brought about was a passionate attachment. They would, indeed, have been married, but for Irving's engagement to Miss Martin. The introduction of Carlyle to Miss Welsh, then twenty years of age, led to a correspondence between them on literary matters. After a time Carlyle attempted to adopt the tone of a lover, but received very indifferent encouragement.

Carlyle had now formed a fairly settled intention of making literature his life work. He made some plans for a history of the British commonwealth, and for a novel association with Miss Welsh, as well as arranged to write a life of Schiller, and a translation of Goethe's *Wilhelm Meister*. These two enterprises fully occupied his leisure while he was engaged as a tutor of the Bullers, whose parents, after spending the winter of 1822 at Edinburgh, removed in the following spring to Kinnaird House, near Dunkeld, on the Tay.

Carlyle paid his first visit to London in 1824, and remained there until March, 1825, superintending the publication, in book form, of his *Life of Schiller*. At this time he received the first of a series of letters from Goethe, and made the acquaintance of Coleridge, Thomas Campbell, Allan Cunningham, Procter, and other literary notables. On March 26, 1825, he removed to the farm of Hoddam Hill, which he had leased, his brother Alexander doing the practical work of farming, while he himself translated German romances.

Miss Welsh now consented to become his wife, after a long correspondence. In 1826 he quarreled with his landlord; his father gave up his farm; and both removed to Scotsbrig, another farm in the vicinity of Ecclefechan. The marriage between Carlyle and Miss Welsh took place in October, 1826, at her grandfather's house at Templand, Dumfriesshire, and they at once settled in Edinburgh. Here Carlyle completed four volumes of translations from Tieck, Musæus, and Richter, which were published under the title of *German Romance*, and commenced a didactic novel but burned his manuscript. An introduction from Procter to Jeffrey led to his becoming a contributor to the *Edinburgh Review*, his first article, on Jean Paul Richter, appearing in June, 1827. The same year he failed in his candidature for the chair of moral philosophy in the university of St. Andrews in succession to Dr. Chalmers. Various subsequent attempts to obtain an academic position for Carlyle met with no better success.

In May, 1828, the Carlyles removed to Mrs. Carlyle's little property of Craigenputtoch, which, in a letter to Goethe, he described as "the loneliest nook in Britain, six miles removed from any one likely to visit me," and there they lived for about six years. Meanwhile, Carlyle wrote magazine articles on Burns, Samuel Johnson, Goethe, Voltaire, Diderot, Schiller, and others. He also wrote a *History of German Literature*, the best parts of which were subsequently published in the form of essays.

There is ample evidence that it was here that he revolved in his mind the great questions in philosophy, literature, social life, and politics, to the elucidation of which — after his own unique fashion — he earnestly dedicated his whole life. His critical and biographical essays written here, too, were the first to open the riches of modern German thought to the English reading world. For this work he was incomparably better fitted than any man then living in Great Britain. Possessing a knowledge of the German tongue such as no foreigner ever surpassed, he was also inspired by the conviction that the literature of Germany in depth, truthfulness, sincerity, and earnestness of purpose was greatly superior to what was admired and relished at home. Gifted, moreover, in a degree altogether unexampled, with a talent for portraiture, he soon painted in ineffaceable colors the images of Schiller, Fichte, Jean Paul Richter, and other foreign magnates, until then almost unheard of.

Gradually educated circles awoke to the fact that a literary Columbus had appeared among them, who had discovered a "new world" of letters, the freshness and grandeur of which were sure to attract, sooner or later, multitudes of adventurous spirits. One of his most beautiful, eloquent, and solid essays, written at Craigenputtoch, was that on Burns. It gave the keynote to all subsequent criticism on the Scottish poet.

But Carlyle's chief work, written on his moorland farm, was *Sartor Resartus*, or "The Tailor Done Over" (the title of an old Scottish song), which occupied him in 1833-34. This work is notable in the literary history of Carlyle as revealing the strong German influence on his mind, and his abandonment of the comparatively simple diction of his earlier essays for the thoroughly individual style of his later works — eruptive, ejaculatory, but always powerful, and often rising to an epic sublimity. It was offered to various

London publishers, and rejected; and at length published in *Fraser's Magazine.* It professes to be a history or biography of a certain Herr Teufelsdröckh ("Devil's Dirt"), professor in the university of Weissnichtwo ("Kennaquhair"), and contains the manifold opinions, speculations, inward agonies, and trials of that strange personage — or rather of Carlyle himself. The whole book quivers with tragic pathos, solemn aspiration, or riotous humor.

Life at Craigenputtoch was varied on the part of Carlyle by occasional visits to Edinburgh, in one of which the idea of writing his *French Revolution* occurred to him; by a residence of six months in London, during which he made the acquaintance of John Stuart Mill and John Sterling; and by visits from old friends like Jeffrey and new admirers like Emerson. In 1830 Carlyle was reduced to great straits; and he had to borrow fifty pounds from Jeffrey for the expenses of his journey to London, although he declined to accept an annuity of one hundred pounds from the same source.

Having by 1834 again saved two hundred pounds, Carlyle resolved to try his fortune in London, and in June established himself in the house, 5 Cheyne Row, Chelsea, in which he lived until the day of his death. Here he settled down to the writing of his *French Revolution.* This enterprise was almost put to an end in 1835, owing to the destruction by a servant of all but four or five leaves of the manuscript of the first volume, which had been lent to John Stuart Mill. Carlyle accepted one hundred pounds from Mill as compensation for his loss.

The work appeared in 1837, and was the first which bore the author's name. Nothing can be more gorgeous than the style of this "prose epic." A fiery enthusiasm pervades it, now softened with tenderness, and again darkened with grim mockery, making it throughout the most wonderful image of that wild epoch. Carlyle looks on the explosion of national wrath as a work of the divine Nemesis, who "in the fulness of times," destroys, with sacred fury, the accumulated falsehoods of centuries. To him, therefore, the revolution was a "truth clad in hell-fire."

In the years from 1837 to 1840 Carlyle lectured to fair, yet select audiences in London, on German literature, the history of European culture, heroes and hero-worship, and other historical subjects, which took form in his later publications. His yearly earnings from these lectures, though varying considerably, maintained him and his wife until the *French Revolution* not only established his reputation as a literary genius of the highest order, and as in Goethe's phrase "a new moral force," but placed him beyond the possibility of want. Yet, until late in life, his annual income from literature was not more than four hundred pounds. In 1838 appeared *Sartor Resartus* in book form, and the first edition of his *Miscellanies.* The following year Carlyle, who at one time was not averse to the idea of becoming a personal force in politics, published the first of a series of attacks on the shams and corruptions of modern society under the title of *Chartism.* This he followed in 1843 with *Past and Present,* and in 1850 with *Latter-day Pamphlets,* which proved among other things that, if he did not quite approve of slavery, he disapproved of the manner in which it had been abolished in the British dominions. In 1845 appeared *Cromwell's Letters and Speeches,* perhaps the most successful of all his works, inasmuch as it completely revolutionized the public estimate of its subject.

From this time Carlyle gave himself up entirely to his largest work, *History of Frederick II. of Prussia, called Frederick the Great,* the first two volumes of which were published in 1858, and which was concluded in 1865. The preparation of this book led him to make two excursions to the continent, which, with a yachting trip to Ostend, two tours in Ireland, and regular visits to his kindred and friends in Scotland, formed the chief distractions from his literary labors. Among the few public movements with which Carlyle identified himself was that which resulted in the establishment of the London library in 1839. In August, 1866, he also allowed himself to be elected chairman of the committee for the defense of Eyre, who had been recalled from his post of governor of the island of Jamaica on the ground of his having shown severity in suppressing a negro insurrection which had broken out in October of the previous year, or as Carlyle put it, for having "saved the West Indies and hanged one incendiary mulatto, well worth the gallows."

During November, 1865, Carlyle was elected lord rector of Edinburgh university by a majority of six hundred fifty-seven votes over three hundred ten recorded for his rival, Disraeli. On April 2, 1866, the ceremony of his installation took place amidst extraordinary demonstrations of enthusiasm, when he delivered an address in which he embodied his moral experiences in the form of advices to the younger members of his audience. The success attending this visit to Edinburgh was quite obliterated by the news which reached him in Dumfries of the death, on April 21st, of Mrs. Carlyle, as she was driving in her carriage in Hyde Park, London. Carlyle's grief developed into remorse when he discovered from certain of her letters, and from a journal which she kept, that during a period of their married life his irritability of temper and unconscious want of consideration for her wishes had caused her much misery and even ill-health, which she studiously concealed from him.

It has also been demonstrated by the *Letters and memorials of Jane Welsh Carlyle* that in the years 1855 and 1856 they were somewhat estranged, owing to Carlyle's liking for the society of Lady Ashburton. After the death of Lady Ashburton there were no differences between them, except such as might be expected in the case of two persons of irritable and high-strung natures, and of uncompromising veracity. These *Memorials* are also of note as proving Mrs. Carlyle to have been one of the keenest critics, most brilliant letter-writers, and most accomplished women, of her time.

Carlyle wrote no important work after his wife's death, although after a visit to Mentone, France, in 1867, where he partially composed his personal *Reminiscences*, he settled down to his old life in London. In August, 1867, there appeared in *Macmillan's Magazine* his view of British democracy, under the title of *Shooting Niagara*. He prepared a special edition of his collected works, and added to them in 1875 a fresh volume containing *The Early Kings of Norway*, and an *Essay on the Portraits of John Knox*. On November 18, 1870, he wrote a letter to the London *Times* on the Franco-German question, defending the attitude of Germany. He expressed privately strong opposition to the Irish policy of Gladstone. In February, 1874, he was offered and accepted the Prussian order of merit in recognition of his having written the life of Frederick the Great, who founded the order. Toward the end of the same year, Premier Disraeli offered him the grand cross of the bath (with the alternative of a baronetcy) and a pension to "an amount equal to a good fellowship," but he declined both.

His eightieth birthday, December 4, 1875, brought Carlyle many tributes of respect, including a gold medal from a number of Scottish admirers, and "a noble and most unexpected" note from Prince Bismarck. On May 5, 1877, he published a short letter in the London *Times*, referring to a rumor that Lord Beaconsfield, as premier, meditated forcing on a "Philo-Turk war against Russia," and protesting against any such design. This was his last public act. On February 5, 1881, he died at his house in Chelsea. A burial in Westminster abbey was offered; but, in accordance with his own wish, he was laid in the churchyard of Ecclefechan beside his kindred. His wife is buried beside her father in the ruined abbey church of Haddington.

As a prophet in the guise of a man of letters, Carlyle exerted a greater influence on British literature during the middle of the nineteenth century, and on the moral, religious, and political beliefs of his time, than any of his contemporaries. As a humorist, using humor seriously, and as a weapon for the enforcement of his opinions, he has no superior; and as a master of the graphic in style he has no rival and no second. He shows an equal facility in photographing nature and in grasping and presenting in appropriate phraseology the salient points of personal character as exhibited in expression, habits, features, build, and dress.

Carlyle, as a man, was irritable, impatient, intolerant, fiercely proud, occasionally hasty in his judgments, and preserved to the last certain Scottish rusticities of manner and mental attitude. But no one ever faced the real misfortunes of life with a calmer courage. He was as incapable of conscious injustice, unkindliness, or vindictiveness, as he was of insincerity or impurity. When in pecuniary straits, even in despair, he never wrote a line that he did not believe, never swerved by a hair's breadth from the noble purposes which dominated his life and extinguished all selfish ambition. He adopted the sane and dignified hypothesis that the working of the universe is informed with purpose, and that, come what may, good in the end must be the final goal of ill.

Moncure D. Conway says, "In one sense, Carlyle was as a city set upon a hill, that cannot be hid; in another, he was an 'open secret,' hid by the very simplicity of his unconscious disguises, the frank perversities whose meaning could be known only by those close enough to hear the heartbeat beneath them; and many, who have fancied that they had him rightly labelled with some moody utterance, or safely pigeonholed in some outbreak of a soul acquainted with grief, will be found to have measured the oak by its mistletoe.

"Graduation from 'Carlyle Close,' now a shamble, to the highest intellectual distinction of the nineteenth century implies the realization of several worlds dim to others. Out of a depth like this his voice will always go forth, and to it the deeps will always answer. The influence of Carlyle will never 'stop'; wherever shams are falling, his sturdy blows will still be heard; generations of the free will recognize that they are offspring of the fire in his heart, burning all fetters; and when the morning stars sing together of dawning days, when heroes of humanity replace nobles without nobility and bauble-crowned kings, his voice, so long a burden of pain, will be heard again rising into song."

VICTOR MARIE HUGO, the greatest of French poets, and a celebrated novelist and orator, was born at Besançon, France, February 26, 1802. He was the third son of General Joseph L. S. Hugo, a soldier of the empire, and Sophie Trebuchet, daughter of a Vendean royalist.

Though a weakling, as a child he was carried, with his boy-brothers, in the train of their father through the south of France, in pursuit of Fra Diavolo, the Italian brigand, and finally into Spain. Subsequently his father was made governor over three provinces, was lord high steward at King Joseph's court, where his eldest son was installed as page. The other two, including Victor, were educated for similar posts among hostile young Spaniards, under stern priestly tutors in the Noble's college at Madrid, a palace become a monastery. Upon the English advance to free Spain of the invaders, the general and his eldest son remained at bay, while the mother and other children hastened to Paris.

In Paris, Victor and his brother Eugene were taught by priests until, by the accident of their roof sheltering a comrade of their father's, a change of tutor was afforded them. This was General Lahorie, a man of superior education, main supporter of Malet in his daring plot to take the government into the republican's hands during the absence of Napoleon I. in Russia. Lahorie read old French and Latin with Victor until the police scented him out and led him to execution, October, 1812. After this tragic episode, Victor entered the college of Louis-le-Grand at Paris, where, at fourteen, he wrote the tragedy, *Irtamène*, and scribbled on the ephemeral politics of those stirring times. In 1817 the French academy mentioned honorably his poem, "On the Advantages of Study," with a misgiving, even, that some older hand was masked under the line ascribing "scant fifteen years" to the author. But when his "Odes" were collected in a volume, Louis XVIII. granted the boy-poet a pension of fifteen hundred francs.

This unexpected munificence on the part of the king enabled Hugo to gratify his first love. In his childhood his father and M. Foucher, head of the war office department, had jokingly betrothed a son of the one to a daughter of the other. General Hugo's eldest son, Abel, had loftier views than alliance with a civil servant's child; Eugene was in love elsewhere; but Victor had fallen enamored with Adele Foucher. It is true, when poverty beclouded the Hugos, the Fouchers had shrunk into their mantle of dignity, and the girl had been strictly forbidden to correspond with her child-sweetheart. But Victor, finding his letters barred out, wrote a love story, "Hans of Iceland," in two weeks, wherein were recited his hopes, fears, and constancy, and this book he hoped she might read.

It pleased the public no less, and its sale, together with that of the odes and a West Indian romance, *Bug Jargal*, together with the royal pension, emboldened the poet to renew his love-suit. To refuse the recipient of court funds being impossible to a public functionary, M. Foucher consented to the betrothal in the summer of 1821, and in October, 1822, they were wed, the bride nineteen, the bridegroom one year older.

In 1826 Hugo published a second set of "Odes and Ballads," and had been introduced by the president of the French academy as "the most promising of our young lyrists." Romanticism was now in full career in France. This movement was initiated by a band of young men, imaginative, ardent, and confident, who sought to renovate French literature by departing from classic rules and models, substituting a varied and very flexible verse for the monotonous Alexandrines of the old school, and making art precisely conform to nature, which they carried so far as even to bring into prominence things which nature herself teaches us to keep out of sight. The new school, *la jeune France*, as they called themselves, formed the romanticists, and their opponents the classicists. The literary war lasted several years.

With the appearance, in 1827, of his tragedy *Cromwell*, Hugo instantly took his place at the head of the romanticists. This tragedy broke lances upon the royalists and upholders of the still reigning style of tragedy. *Cromwell* was not actable, however, and his "Amy Robsart," translated from Sir Walter Scott, in collaboration with his brother-in-law, Foucher, also miserably failed with it, notwithstanding the fact that it possesses a finale superior to Scott's *Kenilworth.*

Hugo now wrote his "Ode to the Napoleon Column in the Place Vendôme"; his satire *Marion Delorme* (1829), and *Hernani* (1830), two plays which were immediately suppressed by the censor, because they had very much irritated the court. *Les Orientales*, published in 1829, had also laid him open to censure. Though written in a Parisian suburb by one who had not traveled, they appealed for Grecian liberty, and depicted sultans and pashas as tyrants, many a line being deemed applicable to personages nearer the Seine than Stamboul. In a number of instances, indeed, his political views had become more than apparent before the seething revolutionary eruption in 1830; and when in the following summer a civil ceremony was performed over the insurgents killed in the previous year, Hugo was constituted poet laureate of the revolution by having his hymn sung in the Pantheon over their biers.

Under Louis Philippe, *Marion Delorme*, probably his best play, could be produced, but livelier attention was turned to *Notre Dame de Paris* written in 1831, the historical romance in which Hugo vied with Sir Walter Scott. It was to have been followed by others, but the publisher unfortunately secured a contract to monopolize all the new novelist's prose fictions for a term of years, and the author revenged himself by publishing poems and plays alone. Hence *Notre Dame* long stood unique. It was translated into all languages, and plays and operas were founded on it.

Heine, even, professed to see in the prominence of the hunchback a personal appeal of the author, who was slightly deformed by one shoulder being a trifle higher than the other. This malicious suggestion reposed also on the fact that the quasi-hero of *Rigoletto*, or *Le Roi s' Amuse* (1832) — a tragedy which was suppressed after one representation, for its reflections on royalty — was also a contorted piece of humanity. The latter was superbly written, and has gone the round of the world as *Rigoletto.* This play was followed by *Lucrèce Borgia*, *Marie Tudor*, and *Angelo*, written in a singular poetic prose. These were well received, and their action alone was sufficiently dramatic to make them successes. They have all been arranged since as operas, and Hugo himself, to oblige the father of Louise Bertin, a magazine publisher of note, also wrote the opera *La Esmeralda*, in 1836, for her music.

In 1837 Louis Philippe made Hugo an officer of the legion of honor, and in 1841 the French academy, having rejected him several times, elected him among the forty immortals. In the year 1838 *Ruy Blas*, for which he had gone to Spanish sources, had been successfully acted. Then, after the imperative Rhine tour, came an unendurable trilogy, *Les Burgraves*, played one long, long night in 1843. A real tragedy, also, was to mark that year, his daughter Leopoldine being drowned in the Seine with her husband, who would not save himself when he found that her death-grasp on the sinking boat was not to be loosed.

For distraction, Hugo plunged into politics. He was created a peer in 1845, and sat in the constituent assembly of France for Paris, between Marshal Soult and Pontecoulant, the regicide-judge of Louis XVI. His maiden speech bore upon artistic copyright; but he rapidly became a power in much graver matters. In 1849 he joined the party of advanced democrats of whom he became a leader and distinguished orator.

As fate would have it, his speech on the Bonapartes induced King Louis Philippe to allow Prince Louis Napoleon Bonaparte to return, and, there being no gratitude in politics, the emancipated outlaw rose as a rival candidate for the presidency, for which Hugo had nominated himself in his newspaper *L'Événement*. The story of the *coup d'état* of 1851, by which Louis Napoleon broke up the national assembly by force, and reëstablished the monarchy, is well known; the republican's side is graphically presented in Hugo's own *L'Histoire d'un Crime*, "The History of a Crime," published in 1877.

Hugo, banished from France by Louis Napoleon, betook himself to Brussels, London, and the Channel islands, waiting to "return with right when the usurper should be expelled." Meanwhile, he satirized the third Napoleon and his congeners with ceaseless shafts, the principal being the famous "Napoleon the Little," based on the analogical reasoning that as the earth has moons, the lion the jackal, man himself his simian double, a minor Napoleon was inevitable as a standard of estimation — the grain, as it were, by which a pyramid is measured. From 1853 to 1859 these flings were collected in *Les Châtiments*, a volume preceded by *Les Contemplations* (mostly written in the '40's), and followed by *Les Chansons des Rues et des Bois*.

Hugo refused to avail himself of the amnesty proclaimed in 1859 to political exiles, and shortly thereafter began the period in which he gave to the world his greatest creations in fiction. In 1862 *Les Misérables*, "Ye Wretched," the most celebrated of his novels, appeared, and was almost simultaneously translated into many languages. In 1866 *Les Travailleurs de la Mer*, "The Toilers of the Sea," whose scenes are laid among the Channel islands, was given to the publisher, and in 1869 *L'Homme qui Rit*, "The Man who Gives," a novel of a fanciful England, made its appearance. It was while writing the final chapters of the latter work that Hugo's wife died, and under the conditions of his exile he could accompany her remains back to France only as far as the Belgian frontier.

All this while, in his Paris daily paper, he and his sons and son-in-law's family were reiterating their blows at the throne; and on the fall of the empire in 1870, and the reëstablishment of the republic, he hastened back to his native country. Upon his return, he again joined the republican movement, and was returned to the national assembly in 1871, which, however, he soon quitted in disgust. He stayed through the commune, and denounced with great vehemence the treaty of peace with Germany.

After the commune he again fled to Brussels where he was too aggressive in sheltering and aiding French fugitives, with the consequence that the Belgian government expelled him from the country, and he had to seek refuge in Vianden, a village of Luxemburg. His poems, written during the war and siege of Paris, 1870-71, collected under the title of *L'Année Terrible*, "The Terrible Year," betray the long-tried exile, "almost alone in his gloom."

In 1874 his novel *Quatre-Vingt-Treize*, "Ninety-three," pleased the general public of France, mainly for the adventures of three charming little children during the prevalence of an internecine war. These phases of a bounteously paternal mood reappeared in *L'Art d'être Grandpère*, "The Art of being a Grandfather," published in 1877, when he had become a life-senator. *Hernani* was in the regular "stock" of the Théâtre Français, *Rigoletto* always at the Italian opera house, while the same subject, under the title of "The Fool's Revenge," held, as it still holds, a high position on the Anglo-American stage. Finally, the poetic romance of *Torquemada*, promised for over thirty years, came forth in 1882 to prove that the wizard-wand had not lost its cunning.

After grief, fêtes were come. On one birthday his compatriots would crown his bust in the chief theater; on another, all notable Paris would parade under his window, where he sat with his grandchildren at his knee, in the shadow of the triumphal arch of Napoleon's star. It is given to few men thus to see their own apothesis.

Victor Hugo died on May 22, 1885. Paris was but the first mourner for all France. A magnificent funeral pageant conducted his coffin, enshrining the remains considered worthy of the highest possible reverence and honors, from the Champs Élysées to the Pantheon. This was the more memorable because the foremost personages in French art and letters marched in his train, and laid a leaf or flower in the tomb of the protégé of Châteaubriand, the brother-in-arms of Dumas, the inspirer of Mars, Dorval, Lemaitre, Rachel, and Bernhardt, and, above all, the Nemesis of the third empire.

Victor Hugo's place in the world's literature is secure. His relation to French literature is something analogous to that of Shakespeare to English and Goethe to German literature. No other author while living — not even Petrarch, or Voltaire, or Goethe — achieved such unbounded national popularity as his. In romance he stood first, although his rivals were George Sand and Balzac; in lyrical poetry he stood first, in spite of Lamartine and Alfred de Musset; in the drama he had no near competitor. He gave to French rhythm a strength and variety it had never known, and invented a prose style which is singularly effective when used by him. His range of character-creation is very broad. He depicts the immensity of the ocean, the battle of Waterloo, the horrors of the Vendée, the innocent prattle of children, with equal mastery. He possessed the genius of emotion to the highest degree; but of reflection, of wisdom, he was much less endowed. Hence, there is often found a strange unevenness in his works, marred by frequent inaccuracy and exaggeration. Controlled wholly by impulse, he lacked a corrective sense of humor, which might have dissipated an evident egotism. He seems the supreme embodiment of the Gallic type; versatile, mercurial, enthusiastic, delighting in the half-truths of the epigram, demanding brilliance at any cost, readily imbibing new ideas and embarking on new schemes, sympathizing with those who suffer, and sincerely rhetorical.

But Hugo was always a master spirit; always the eloquent and fearless advocate pleading in behalf of the down-trodden — the champion of the outcast against society which has cast them out. He has the brilliance and eloquence and sometimes the sophistry of the special pleader. A true orator, he knows the magic which sways the heart, if not the head. Whatever may be the value of this power as compared with the impersonal majesty of Shakespeare or Sophocles, Victor Hugo's endowment of it is unmatched. His impulses were ever noble: he refused pensions from Bourbons and soft promises of amnesty from Napoleon III. rather than sell his freedom of speech; he succored the distressed; and forgave all enemies except those of liberty. And in an age when his ablest contemporaries treated chastity and the ties of family with contempt, he was steadfastly on the side of morality. His creed was deistic — he believed in immortality.

The English poet, Swinburne, who was one of Hugo's most appreciative interpreters, declared that he is "above all things a poet. Throughout," he says, "all the various and ambitious attempts of his marvelous boyhood — criticism, drama, satire, elegy, epigram, and romance — the dominant vein is poetic. His example will stand forever as the crowning disproof of the doubtless more than plausible opinion that the most amazing precocity of power is a sign of ensuing impotence and premature decay. There was never a more brilliant boy than Victor Hugo; but there has never been a greater man. * * * But from the first, without knowing it, he was on the road to Damascus; if not to be struck down by sudden miracle, yet by no less inevitable a process to undergo a no less unquestionable conversion.

"Hugo, for all his dramatic and narrative mastery of effect, will always probably remind men rather of such poets as Dante or Isaiah than of such poets as Sophocles or Shakespeare. We cannot, of course, imagine the Florentine or the Hebrew endowed with his infinite variety of sympathies, of interests, and of powers; but as little can we imagine in the Athenian such height and depth of passion, in the Englishman such unquenchable and sleepless fire of moral and prophetic faith." If he did not equal his great rival, Balzac, in the latter's field, he surpassed him in poetic genius and expression.

RALPH WALDO EMERSON, essayist, speculative philosopher, and poet, is the most representative, if not the greatest name in American literature. He was born at Boston, Massachusetts, May 25, 1803, and was descended from a long line of ministers, among whom was the Rev. Peter Bulkeley, the founder of Concord, Massachusetts, and its first minister. His father, Rev. William Emerson, was pastor of the First Unitarian church, Boston, but died when his son was in his eighth year. After this event Ralph Waldo's education was continued under the supervision of his mother, a woman of very superior qualities, and he also came much under the influence of his father's sister, Miss Mary Moody Emerson, whose extant writings are said to resemble those of her distinguished nephew in style and thought.

In 1817 Emerson entered Harvard college — after having attended the Boston Latin school — and received his degree in arts in 1821. While at college he does not seem to have made any great impression upon his classmates, and his honors were confined to a second prize in composition and his selection as class poet. He spent much time in the library, and was superior to most of his classmates in his knowledge of general literature. After graduation he taught in his elder brother's school at Boston for a while, and in 1823 began to study for the ministry with William Ellery Channing, at the same time attending lectures at the Harvard divinity school. His health failing in 1826, he spent the ensuing winter in Florida. In 1829 he was elected assistant and afterward sole minister of the Second church, Boston, a Unitarian congregation, as colleague of Rev. Henry Ware; and in the same year he married his first wife, Ellen Louisa Tucker, who died in 1832. In 1832 he resigned for conscientious reasons, declaring in a farewell sermon his scruples against administering the ordinance of the Lord's supper, and, in Dr. Holmes's words, "the grounds upon which those scruples were founded." He continued to preach at various churches, however, with some regularity until 1838, and occasionally as late as 1847, although always declining a regular call.

In December, 1832, he sailed for Europe, where he made the acquaintance of Landor, Coleridge, and Wordsworth, and visited Carlyle at Craigenputtoch. Between Carlyle and himself a lifelong friendship sprang up, and Emerson edited the first American edition of *Sartor Resartus* in 1836. Indeed, each acted generally as literary agent for the other in their respective countries. Neither, however, quite sympathized with the other's philosophical position.

Emerson returned to America in 1833. He took up his permanent residence in Concord, Mass., in 1834, married his second wife, Lydia Jackson, the year after and led a quiet, retired, meditative life. He prepared there the lectures which he delivered in Boston and vicinity shortly thereafter, and wrote essays. The year 1836 was signalized by the publication of the earliest and perhaps most important of his works, the tractate on *Nature,* and by those meetings at Emerson's house of a few like-minded thinkers who became known as the transcendental school of philosophy. In this year, also, he wrote the memorable *Concord Hymn* for the dedication of the monument raised in commemoration of the battle of Concord.

Emerson's name was next brought into public notice by his oration before the Phi Beta Kappa society in 1837, on *The American Scholar,* which Dr. Holmes afterward described as "the intellectual declaration of independence" of America, and by a discourse delivered to the graduating divinity class at Cambridge in 1838.

RALPH WALDO EMERSON

From a photograph

These two productions strike the keynote of his philosophical, poetical, and moral teachings. The latter was a plea for the individual consciousness as against all historical creeds, bibles, and churches, and in behalf of the soul of each man as the supreme judge in spiritual matters. His pronouncements created a great sensation, especially among Unitarians, and much controversy followed, in which, however, Emerson took no part.

His first series of *Essays* appeared in 1841, and, by their freshness, originality of thought, and sparkling beauty of expression, compelled much attention. In the previous year he had assisted in the founding of *The Dial*, the organ of New England transcendentalism, contributing to its pages more than forty prose and metrical pieces, including *The Transcendentalist* and *The Conservative*, and such poems as *The Problem*, *Woodnotes*, *The Sphinx*, and *Fate.* The publication was first edited by Margaret Fuller, and included among its contributors William Henry Channing, A. Bronson Alcott, Theodore Parker, George Ripley, James Freeman Clarke, and others of the transcendental school. On Miss Fuller's retirement, at the end of the second volume, Emerson took up the editorship, and conducted the periodical until its discontinuation in 1844. He was also at this time a curious observer of the Brook Farm experiment, in which he did not take part. He characterized it as "a noble and generous movement in the projectors to try an experiment of better living," but gently ridiculed the methods of the colony in his *Historic Notes.*

A second volume (or series) of *Essays* made its appearance in 1844. It was characterized by the same striking peculiarities of thought and expression that had previously attracted so many readers, and soon procured for him a multitude of admirers on both sides of the Atlantic. A collection of his poems was published in 1846; and in the following year he paid his second visit to England in the form of a lecturing tour — a visit whose chief result was the publication in 1856 of the volume *English Traits* — one of his most popular and attractive books.

In 1850 he issued a volume on *Representative Men*, one of the most important of all his publications. It consists of a series of studies or portraits, typical of various classes of mind, in which are treated Plato, Shakespeare, Montaigne, Goethe, Swedenborg, and Napoleon. A decade later appeared *The Conduct of Life*, a series of essays on *Power*, *Culture*, *Behavior*, and like topics, which served as a guide to manners for more than one generation of Emerson's disciples. This work brings clearly into view the exalted moral and ethical principles which underlie and pervade all that he has written. Harvard university gave him the degree of doctor of laws in 1866.

On the conclusion of the civil war he published his *Mayday and Other Pieces*, followed in 1870 by a prose volume, *Society and Solitude.* In 1874 he published *Parnassus*, an anthology on English verse; while a final volume of essays, *Letters and Social Aims*, prepared from his earlier lectures, appeared in 1875. He contributed to the *North American Review* in 1878 a paper on the *Sovereignty of Ethics*, which contained the ripest fruit of his broad culture; and his address of 1879 before the Harvard divinity school at Cambridge was published in 1880 under the title of *The Preacher.* His last years were spent in revising his unpublished manuscripts and preparing a complete edition of his works. He died at Concord, Massachusetts, April 27, 1882.

In his personal appearance Emerson was a typical New Englander of college-bred ancestry. Tall, spare, slender, with sloping shoulders, slightly stooping in his later years, with light hair and eyes, the scholar's complexion, the prominent, somewhat arched nose which belongs to many of the New England subspecies, thin lips, suggestive of delicacy, but having nothing like primness, still less of the rigidity which is often noticeable in the generation succeeding next to that of the men in their shirt-sleeves, he would have been noticed anywhere as one evidently a scholarly thinker astray from the alcove or the study, which were his natural habitats. His voice was very sweet and penetrating without any loudness or mark of effort. His enunciation was beautifully clear, but he often hesitated as if waiting for the right word to present itself. His manner was very quiet, his smile was pleasant, but he did not like explosive laughter any better than Hawthorne did. None who ever met him failed to recall that serene and kindly presence, in which there was mingled a certain spiritual remoteness with the most benignant human welcome to all who were privileged to enjoy his companionship.

The key to Emerson's mental position is to be found in his intense individualism. Whatever interferes with the full development of the individual, whether it be the political organization of the state or the authority exerted by venerated names in religion and letters, is to be regarded in his conception as more or less an evil. In the midst of his literary labors Emerson found time to manifest his interest in great public questions as they arose. Some of his letters upon passing events in the newspaper press of his day exerted a wide influence. While he was a pastor in Boston he opened his pulpit to an earnest protest against American slavery, and during the whole period of the anti-slavery agitation he constantly manifested his sympathy with those who sought to deliver the land from human bondage. In 1844 he gave emphatic expression to his views in the British West Indies. Though not in the technical sense of the word a reformer, his habits and tastes being rather those of a scholar and man of letters, every earnest movement for the welfare of humanity had his sympathy. He gave his name to the call issued in 1850 for the first convention ever held in Massachusetts to secure for women equal rights with men as citizens and voters.

As a writer, Emerson is eminently distinguished for a singular union of poetic imagination with practical acuteness. His observations on society, on manners, on character, on institutions, are stamped with rare sagacity. To some he is untrammeled by the rules of the versifier; to others the prophet; and again he is by turns a visionary, and the shrewdest of guides in the ways of the world. His style is in the nicest harmony with the character of his thought; and, though marked by an ethical and spiritual vitality of the highest order, is utterly devoid of system, and pervaded by a certain mystical quality, charming to some but bewildering to others. His intellectual gems are profusely sown throughout his pages according to no visible or conscious method, and with settings that seem quite accidental; but they glow with a genuine luster wherever found. To the arts and processes of the logician he pays no regard, evidently thinking that they tend to belittle, rather than exalt, the truth. He simply affirms what he believes, making his appeal at every step to the moral institutions of the reader, in the faith that the "spirit of man is the candle of the Lord," with a power of illumination adapted to every emergency. He knows that an idea is more forcible and attractive, and can be clothed in more brilliant and picturesque phraseology when it is not qualified, and, as it were, dragged down from its elevation by the influence of other ideas. He loves to watch the play of thought, and to dream and muse about it, borne up on the wing of a pure and delicate imagination, rather than to weigh its significance, or to build it up into an "intellectual system" or a creed. Emerson thus belongs to the class of minds which are intuitional rather than reflective, and subtle rather than sagacious. His thinking charms, animates, and vividly excites the mental faculty of his reader, but it does not settle any question conclusively. Hence his speculations on religion, philosophy, literature, and life, though intensely stimulating to the young, are sometimes coldly regarded by men of mature and sage understanding.

Emerson can no more be measured for any regulation uniform worn by the army of writers than the rolling clouds that veil and reveal the summer sky can be condensed into a valise. In an age of unlovely materialism, in a land where progress is too much measured by profits, he dared to play the part of the youth with the banner "Excelsior," even if the nobility of the unpractical climb won only smiles in the market place. His pure and expansive soul mirrored the aspirations of all great souls in all ages and countries, and, if the rays reflected were confusing to the average eye that would separate them, the intense force of the sunbeam of his intellect will cause it to shine the brighter and penetrate further into the dim future.

Emerson has nowhere defined the fundamental basis of his philosophy; but his general attitude toward science throughout his writings is that of the poet and Platonist who views the phenomena of nature as so many adumbrations of ideal truths. He insists on the identity of physical and moral law; the same laws govern a state and an acid. He was known at one time as a transcendental philosopher; but even his appreciative admirers now rarely use that term.

His earlier writings are supposed by some to show a drift toward pantheism, but others repel this interpretation as unjust. Certainly he has never called himself a pantheist, and there is unquestionable evidence that whatever may have been his former speculations, that name cannot truly be applied to him now. His friend, A. Bronson Alcott, reports him as saying: "I do not care to classify myself with any painstaking accuracy with this sect or with that; but if I am to have any appellation at all of a religious kind, I prefer to be called a Christian theist. You must not leave out the word Christian, for to leave out that is to leave out everything." Confirmation of this is to be found in his latest publication, *The Preacher*, in which he says: "Unlovely, nay, frightful, is the solitude of the soul which is without God in the world. To see men pursuing in faith their varied action, warm-hearted, providing for their children, loving their friends, performing their promises — what are they to this chill, houseless, fatherless, aimless Cain, the man who hears only the sound of his own footsteps in God's resplendent creation?" He will not recognize a God, however, who is not "one with the blowing clover and the falling rain."

In regard to man and his destinies, Emerson entertains exalted hopes; but religion is not in his eyes a divinely revealed — in the ordinary sense — or infallible thing. All creeds are merely "the necessary and structural action of the human mind" in the course of its historical progress. Man made them all, and he believes that from the inexhaustible depths of our nature there will come forth in due time new and ever higher faiths, which will supersede those that have gone before.

What we have to learn from Emerson is chiefly the divine immanence in the world, with all its corollaries, from the point of view of the poet. Indeed, he says of himself: "I am not a great poet, but whatever there is of me at all is poet." Though not a new philosophy, it was restated by him in the fashion most suitable to his age, and with a cogency and attractiveness rivaled by no contemporary.

Like most poets, he was under the influence of beauty in its various forms, and could hardly ascribe anything but excellence to the ndowment of personal beauty. He associated the beautiful with the good; and like Augustine and the best philosophers he would ot allow the existence of positive and original vil. But of sin, even in a theological sense, e had a clear perception; and he knew the ark places of the human heart as well as Hawthorne did, though he did not delight in heir portrayal.

If we tried to sum up his message in a phrase, we might perhaps find most applicable the famous dictum from Keats, "Beauty is truth, truth beauty"; only, while Keats was evidently more concerned for beauty than for truth, Emerson held an impartial balance. These are with him the tests of each other: whatever is really true is also beautiful, whatever is really beautiful is also true. Hence, he has especial value to a world whose more refined spirits are continually setting up types of æsthetic beauty which must needs be delusive, as well as discordant with beauty contemplated under the aspect of morality; while the mass never think of bringing social and political arrangements to the no less infallible test of conformity to an ideally beautiful standard.

Even more important is that aspect of his teaching which deals with the unalterableness of spiritual laws, the impossibility of evading truth and fact in the long run, or of wronging any one without at the same time wronging oneself. Happy would it be for the United States if Emerson's essay on *Compensation*, in particular, could be impressed upon the conscience, where there is any, of every political leader; and interwoven with the very texture of the mind of every one who has a vote to cast at the polls!

The special adaptation of Emerson's teaching to the needs of to-day is, nevertheless, far from the greatest obligation under which he has laid us. His greatest service is to have embodied a specially American type of thought and feeling. It is the test of real greatness in a nation to be individual, to produce something in the world of intellect peculiar to itself and indefeasibly its own. Such intellectual growths are indeed to be found in our literature before Emerson's time, but they are not of the highest class. Franklin was a great sage, but his wisdom was worldly wisdom. Emerson gives us, in his own phrase, "morality on fire with emotion" — the only morality which in the long run will really influence the heart of man.

The idealist or transcendentalist in philosophy, the rationalist in religion, the bold advocate of spiritual independence, of intuition as a divine guidance, of instinct as a heaven-born impulse, of individualism in its fullest extent, making each life a kind of theocratic egotism — this is the Emerson of his larger utterances. For him nature was a sphinx, covered with hieroglyphics, for which the spirit of man is to find the key.

BROWNING

A. D.		AGE
1812	Born at Camberwell, England,	..
1829	Entered University college, London,	17
1833	*Pauline,*	21
1833–34	Traveled in Russia and Italy,	21–22
1835	*Paracelsus,*	23
1837	*Strafford:* a tragedy,	25
1840	*Sordello,*	28
1841–46	*Bells and Pomegranates,*	29–34
1846	Married; settled at Florence, Italy,	34
1850	*Christmas Eve and Easter Day,*	38
1855	*Men and Women,*	43
1861	Death of his wife; settled in London,	49
1864	*Dramatis Personæ,*	52
1868–69	*The Ring and the Book,*	56–57
1872	*Fifine at the Fair,*	60
1879–80	*Dramatic Idyls,*	67–68
1889	*Asolando;* died at Venice, Italy,	77

ROBERT BROWNING, one of the greatest of English dramatic poets, was born at Camberwell — a suburb of London — England, May 7, 1812. He was the child of affectionate and cultured parents, brought up in a prosperous and well-ordered household, and imbued with noble ideals. His boyhood foreshadowed intellectual and literary qualities of an exceptional order, and, before he had passed his twelfth year, he had produced and had printed for him, by his father, a poetic effusion entitled *Incondita.*

His education was of the most informal kind, and was largely under private tutors. He does not seem to have attended the public schools, nor the university in the usual way, but when he had made considerable advancement under private instruction, the records show that he was entered at University college, London, during the session of 1829-30, for a course of lectures. *Pauline,* a dramatic poem, written at the age of nineteen, was published in 1833, but did not evince extraordinary powers. The most important event in his youth was his sojourn during 1833-34 in Russia and Italy. He went to the former country nominally as secretary to the Russian counsel-general, and became so enamored of diplomatic life that he attempted to enter it but failed. Even in after years its charms did not release their hold on him, and he was anxious that his son might choose this career.

Browning's earliest dramatic effort, *Strafford,* was produced by Macready at Covent Garden, London, in 1837, but was unsuccessful, notwithstanding Macready himself personated the hero. Two years earlier appeared his *Paracelsus,* which revealed a much greater force than his *Pauline.* Its boldness of thought, lofty aspirations, and grip of human passion, marked him as a writer of unusual gifts; and from this date Browning determinedly devoted himself to the art of poetry. It is significant to note in this connection that the three greatest modern English poets — Wordsworth, Tennyson, and Browning — each, consciously and scrupulously, ordered his life and surroundings to the one great end of their high calling, never swerving, never despairing, never expending energy in any other direction.

Sordello, which for its involutions of thought has given more trouble to Browning's readers than any other of his works, appeared in 1840. In it the author traces, with much crabbed writing and elliptical thinking, the development of a soul, following his hero, in the person of an Italian poet named by Dante, until his ambition closes in death. Incidentally, the poem gives a picture of the restless and troubled conditions of northern Italy in the early part of the thirteenth century.

A series of plays, tragedies, and dramatic lyrics, written by Browning between 1841 and 1846, was issued under the collective title of *Bells and Pomegranates* in the latter year. The plays included *Pippa Passes, King Victor and King Charles,* and *Colombe's Birthday;* and the tragedies, *The Return of the Druses, A Blot in the 'Scutcheon, Luria,* and *A Soul's Tragedy.* Among the lyrics were, *How they Brought the Good News from Ghent to Aix, Saul, The Lost Leader,* and *The Pied Piper of Hamelin* — poems which became, and still remain, the most popular of all Browning's writings. In these lyrical efforts the poet pressed into his service in a masterly degree humor, pathos, passion, and tenderness; while the whole were distinguished for their ringing and melodious versification. His play, *A Blot in the 'Scutcheon,* was produced at Drury Lane theater, but failed through lack of vivid and impressive incident; although it was afterward produced in this country by Lawrence Barrett. *Pippa Passes* secured a much greater measure of popular approbation.

Browning married, in 1846, Elizabeth Barrett, herself a poetess of high and noble gifts, and with her he went to Florence, where they lived for fifteen years in perfect and happy union. There, in 1849, their only son, Robert Barrett Browning, the sculptor, was born. In 1850 Browning published *Christmas Eve and Easter Day*, a poem which defends catholicity in religion, the good to be discovered in the varying forms of Christianity. *Men and Women*, which appeared in 1855, contained some of its author's finest work, including the stirring poems of *Fra Lippo Lippi*, *Childe Roland*, *Andrea del Sarto*, *Evelyn Hope*, *Holy Cross Day*, and *Up at a Villa*. These poems, for depth and subtlety of conception, profound analysis of the human mind in its most delicate and impassioned conditions, and speculative insight, are unsurpassed in the English language.

After the death of his wife in 1861, the poet settled permanently in London with his only son. *Dramatis Personæ*, issued in 1864, again attested the strength of Browning's dramatic gifts in monologue. These poems included *Abt Vogler*, *Caliban*, *A Death in the Desert*, and *Rabbi ben Ezra*, in which the writer unfolded his views upon music, philosophy, and the higher questions affecting life and immortality. His generally accepted masterpiece, *The Ring and the Book*, was published in 1868-69. It is written in epic form, and has for its basis the narrative of a murder by an Italian count as related by the various persons concerned in the tragedy. It deals in a most searching and complete manner with the powerful passions of humanity. The intellectual labor involved in this stupendous achievement, which embraces twenty-one thousand one hundred sixteen lines, is a marvel in itself, and there are many poetic passages scattered throughout the work which are as splendidly beautiful as anything that has been written in verse.

Hervé Riel, a poem upon a French sailor hero, was published in 1871, the proceeds being given to the fund for the relief of Paris; and from this time onward, works by Browning appeared in rapid succession. *Balaustion's Adventure*, with the *Alcestis* of Euripides in an English dress, was the poet's first essay in Greek subjects; *Prince Hohenstiel-Schwangau, Saviour of Society*, dealt with the career of Louis Napoleon; *Fifine at the Fair*, which was published in 1872, handled a question in morals very powerfully; *Red Cotton Night-Cap Country* told the story of a famous Norman law case; *Aristophanes' Apology* was a second venture among the great Greek poets; *The Inn Album* was a graphic story of a deeply-wronged woman; *Pacchiarotto, and How He Worked in Distemper* gave the author an opportunity of defending his poetic methods; *The Agamemnon of Æschylus* was a graphic transcript of that famous work; and *The Two Poets of Croisic* advanced a strong vindication of the faith in the future life.

Then came, in 1879-80, two volumes of *Dramatic Idyls*, which may be described as vigorous character sketches, each idyl having a distinct and leading purpose. All are intense in their realism, and across the page constantly breaks the strong lightning flash of genius. *Jocoseria*, a volume containing a number of narrative poems, was published in 1883; and in 1884 appeared *Ferishtah's Fancies*, a work consisting of twelve poems, each dealing with some profound question touching the relations of man with the divine. *Parleyings with Certain People of Importance in Their Day* was issued in 1887. Here again the author adopted his favorite method of developing through the medium of narrative his views upon important philosophical, literary, artistic, and other questions.

From 1861 until 1889 Browning continued to reside in London; first, for more than a quarter of a century, in Warwick Crescent, Paddington, and then, for the last two years, in De Vere Gardens, South Kensington. During this period, however, he made frequent and often prolonged visits to Italy. In November, 1889, he paid a visit to his son in Venice, and there, at the Palazzo Rezzonico — which he had bought for his Venetian residence — he died December 12th, of the same year, after a short and painless illness. His death took place on the very day that his last volume of poems, *Asolando: Fancies and Facts*, was published. His remains were placed in Westminster abbey.

Browning, generally speaking, is distinguished for the depth of his spiritual insight, his dramatic energy, his power of psychological analysis, and for his capacity to create real men and women. In these respects he has rarely been equaled. Besides being one of the most erudite of poets, he has intense human sympathies and high imaginative gifts, and a profound and vigorous faith. On the other hand, his style is too frequently obscure and difficult, his versification hard and rugged, and his rhymes forced. As between him and Tennyson—with whom frequent comparison is made—it is undoubtedly true that the latter far excels him in melody of versification and artistic beauty of style, but just as truly falls below him in vigor and brilliancy of thought.

The first great characteristic of Browning's poetry is undoubtedly the essential, elemental quality of its humanity — a trait in which it is surpassed by no other English poetry but that of Shakespeare. It can be subtle to a degree almost fantastic (as can Shakespeare's to an extent that familiarity makes us forget); but this is in method. The stuff of it — the texture of the fabric which the swift and intricate shuttle is weaving — is always something in which the human being is vitally, not merely æsthetically, interested. It deals with no shadows, and, indeed, with few abstractions, except those that form a part of vital problems — a statement which may provoke the scoffer, but will be found to be true.

A second characteristic, which, if not a necessary result of this first, would at least be impossible without it, is the extent to which Browning's poetry produces its effect by suggestion rather than by elaboration; by stimulating thought, emotion, and the æsthetic sense, instead of seeking to satisfy any one of these — especially instead of contenting itself with only soothing the last.

And a third trait in Browning follows logically from this second; its extreme compactness and concentration. Browning sometimes dwells long — even dallies — over an idea, as does Shakespeare; turns it, shows its every facet; and even then it is noticeable, as with the greater master, that every individual phrase with which he does so is practically exhaustive of the suggestiveness of that particular aspect. But commonly he crowds idea upon idea even in his lyrics, and — strangely enough — without losing the lyric quality; each thought pressed down to its very essence, and each with that germinal power that makes the reading of him one of the most stimulating things to be had from literature. His figures, especially, are apt and telling in the very minimum of words; they say it all, like the unsurpassable Shakespearean example of the dyer's hand; and the more you think of them, the more you see that not a word could be added or taken away.

It may be said that this quality of compactness is common to all genius, and of the very essence of all true poetry; but Browning manifested it in a way of his own, such as to suggest that he believed in the subordination of all other qualities to it; even of melody, for instance, as may be said by his critics and admitted in many cases by even his strongest admirers.

The vividness, vigor, and truth of Browning's embodiments of character come, it is needless to say, from the same power that has created all great dramatic work — the capacity for incarnating not a quality or an ideal, but the mixture and balance of qualities that make up the real human being. There is not a walking phantom among them, or a lay figure to hang sentiment on. Some one has said that of all the poets he remembered, only Shakespeare and Browning never drew a prig. It is this complete absence of the false note that gives to certain of Browning's poems the finality which is felt in all consummate works of art, great and small; the sense that they convey, if not the last word, at least the last necessary word, on their subject.

Andrea del Sarto is, in its way, the whole problem of the artist-ideal, the weak will of the inner failure in all times and guises; and at the other end of the gamut nobody will ever need again to set forth Bishop Blougram's attitude, or even that of Mr. Sludge the medium. Of the informing, almost exuberant vitality of all the lyric and dramatic poems, it is needless to speak; that fairly leaps to meet the reader at every page of them, and a quality of it is their essential optimism.

"What is he buzzing in my ears?
Now that I come to die,
Do I view the world as a vale of tears?
Ah, reverend sir, not I!"

The world was never a vale of tears to Robert Browning, man or poet; but a world of men and women, with plenty of red corpuscles in their blood. Most thinkers write and speak of man; Browning of men. With man as a species, with man as a society, he does not concern himself; but with individual man and man. Every man is for him an epitome of the universe, a center of creation.

Through nature, Wordsworth would lead the soul to rest. Through the spiritual struggles of the soul itself, Browning reveals the divine touch that discloses the true end of living and thinking.

FINE ARTS

PHIDIAS

PHIDIAS was the greatest sculptor of Greece, and by many is regarded as the greatest sculptor in the whole history of art. In spite of his renown, we unfortunately know only the most meager details concerning his personal history — not even the dates of his birth and death. Two facts are certain in the chronological history of his life. The first is that the statue of Minerva, which he erected in the Parthenon of Athens, was finished in the year 438 B. C., and that he represented himself in the bas-reliefs which adorned the shield of the goddess as a bald-headed old man. The second fact is that he introduced in the bas-reliefs of the throne of Jupiter at Olympia the figure of the youth Pantarces, placing on his head the crown which he had won in the Olympian games in the eighty-sixth Olympiad (436 B. C.). It is generally supposed that he was born in Athens about the year 500 B. C.— sometime, at least, before the battle of Marathon — and that he died about 432 B. C.

Phidias was the son of Charmides, and was descended from a family of artists. His youth was passed in the time of the great struggle between the Greeks and the Persians and during the illustrious career of Cimon, who founded an empire at Athens. He studied his art first under Hegias at Athens and then under Ageladas of Argos, one of the most celebrated sculptors of his time.

He began life as a painter, but when Cimon undertook to rebuild and adorn Athens, after its destruction by Xerxes, he came into view as a sculptor. His great works were all executed during a period most favorable for the development and encouragement of genius, when Greece was triumphant over external enemies and her people enjoyed a more perfect liberty than at almost any other period of their history. With the character of the age correspond the works of its poets, particularly of the tragedians, Æschylus, Sophocles, and Euripides, and of its sculptors, particularly of Phidias.

The first public work of Phidias was probably the statue of Athena (Minerva), at Platæa. The "Athena Promachos," which stood on the Acropolis at Athens, between the Parthenon and the Propylæa, was probably executed soon afterward. This statue was of bronze. With the pedestal it was between fifty and sixty feet high, and navigators on coming round the cape of Sunium could perceive the point of the goddess's spear and the crest of the helmet. Phidias was not intrusted single handed with the execution of so colossal a work, but he is universally accredited as the designer, and presiding genius of the entire decoration.

It was probably about the same time that Phidias executed the goddess of Minerva in the town of Pellene in Achaia. This figure was of ivory and gold. The employment and the union of these materials in sculpture were not a new invention, for examples of their use are found in the most remote times; but it was reserved for Phidias, thanks to the growth of wealth and luxury, to produce colossal statues of this kind, which surpassed by their magnificence all that had preceded them, and to create models which after ages have not had the genius even to equal.

The administration of Cimon was also rendered memorable by another work of Phidias, namely, the offering which the Athenians consecrated in the temple of Delphi, in memory of the victory at Marathon. It was composed of thirteen statues, that of Miltiades being placed by the side of Apollo and Minerva. The rank accorded to Miltiades, although he had died in prison, clearly shows that this monument belongs to the period when Cimon in all the splendor of his glory restored to his father the honor which the latter had so justly merited.

It was also at the epoch of the greatest power of Athens, when the victories of Cimon increased the number of her allies, that the inhabitants of the isle of Lemnos offered to the Athenians the statue, which, in consequence of its origin, was called the "Lemnian Minerva." Phidias impressed on this figure a beauty to which art had not before attained. Lucian preferred it to all the other statues modeled by this great artist, and Pausanias did not hesitate to say that of all the images of Minerva produced by Phidias, this was the most worthy of the tutelary goddess of Athens. The statue of the mother of the gods, placed in the temple of that goddess at Athens, and the "Amazon" of the temple of Delphi, which are also reckoned among the first productions of Phidias, date from about the same period.

The sculptor had now trained two pupils who were worthy of him — Alcamenes and Agoracritus. Both these young artists executed in a competition marble figures representing Venus Urania. The work of Alcamenes was preferred to that of his rival. It was said that the master had worked on it, and this opinion was so well established that the ancients appear generally to have attributed it, not to Alcamenes, but to Phidias himself.

These different works had acquired for Phidias a brilliant reputation when the government of Pericles succeeded to that of Cimon. Pericles not only gave to Phidias a commission to execute all the more splendid statues that were to be erected, but made him general superintendent of all works of art going on in the city. Plutarch tells us that Phidias had under him architects, statuaries, workers in copper and bronze, stone-cutters, gold and ivory beaters, and other artisans. To Phidias, as director-general of all the skilled artists and artificers of Athens, we owe, among other glorious edifices, the Propylæa and the Parthenon, or temple of Minerva, the sculptured ornaments of which were executed under his direct superintendence, while the statue of the goddess Athena, the materials for which were ivory and gold, was the work of Phidias himself. Writers never speak of this statue of Athena, or Minerva, except in raptures, yet what has rendered the name of the artist immortal proved at that time his ruin. The statue, clothed with a golden robe, is gone forever, and the Parthenon is now only a magnificent wreck; but we still possess some splendid evidence of the genius of Phidias in the sculptures and friezes of the temple, which are now preserved in the British museum in London under the name of the Elgin marbles.

These marbles were removed from Athens between 1801 and 1803, by Lord Elgin, at that time British minister to Constantinople, who procured permission from the Porte to take away from Athens "any stones that might appear interesting to him." The "stones" exhibit the highest development of Greek art. As types of beauty they have never been surpassed, and even in their present fragmentary condition they afford models of form which modern art has not been able to equal.

About 433 B. C., Phidias went to Elis, where he produced a colossal statue of Zeus (Jupiter Olympus), also of ivory and gold. This is considered his masterpiece, and was afterward ranked among the most wonderful works of art in the world. It was executed with "astonishing sublimity of conception," its dimensions being sixty feet high, and in every way proportioned. "The majesty of the work equaled the majesty of the god," says Quintilian, "and its beauty seems to have added luster to the religion of the country." This celebrated statue was removed by the emperor Theodosius to Constantinople, where it was destroyed by a fire, 475 A. D.

On his return to Athens, political passions were running high. There was a strong — at least a violent — party inimical to Pericles, but as they did not dare attack the great statesman, they assailed him through his friends, Phidias, Anaxagoras, Aspasia, and others. Phidias was accused of having appropriated to himself some portion of the gold destined for the robe of Athena. This accusation he repelled by taking off the robe and weighing it. He was then accused of impiety, for having introduced his own likeness and that of Pericles on the shield of the goddess. On this most frivolous and contemptible pretext he was thrown into prison, and died there, but whether of sickness or poison is uncertain. Recent research detects in a late and rude copy of the shield of Athena the portrait of Phidias himself, in a head unquestionably taken from life, and wholly unlike any possible ideal type. He is "a bald-headed old man," as described by Plutarch, apparently about sixty years of age, with an unsymmetrical head of the

Socratic cast. This may represent a traditional portrait of the sculptor.

As a candidate for the honor of future ages, Phidias was singularly fortunate. He saw the rise and grandeur of the noblest century of the Greek world. He carved its ideals in marble, and enshrined them in a temple, and this temple, with its works, has become the standard by which all succeeding art is, either consciously or unconsciously, measured. Moreover, he had the good fortune to be inspired at this happy moment with such a realization of the image of the supreme deity, that its expression in material shape served to establish the type for all time.

We may form some conception of the character of that lost work by the study of the well-known head — the *Jupiter Otricoli.* The high and expansive arch of forehead, the masses of hair gently falling forward, the largeness of the facial angle, which exceeds ninety degrees, the shape of the eyebrows, the perfect calmness and commanding majesty of the large and full-opened eyes, the expressive repose of all the features, and the slight forward inclination of the head are the chief elements that go to make up that representation, which, from the time of Phidias downward, has been regarded as the perfect ideal of supreme majesty and entire complacency of the "father of gods and men," impersonated in human form.

"There exists a God, Creator, and Father of all beings, older than the sun, older than the heavens, greater than time, greater than eternity, greater than nature itself, which dissolves and perishes; a God that the voice cannot express, that the eyes cannot see, but still one that imperfect man, a prisoner in the flesh, has need to imagine in sensible forms. Statues are the material symbols of the inaccessible divinity. The duty of the artist is to comprehend the divine nature, and to make it comprehensive to the consciousness of his fellow men. With the Greeks it was the art of Phidias that awakened in their souls the souvenir and the thought of deity."

Phidias is said to have declared that he drew his ideal of the gods from the description of Homer. And it is in the Homeric quality of serene majesty and simple beauty that his art excels. His work is as free as that of Homer himself from any taint of exaggeration, affectation, false emphasis or sensuousness. It is always at once sublime and perfect. It was a saying of the ancients that "the hand of Phidias alone of men could make the image of the gods." With this power of ideal majesty, he combined a full technical mastery over every form of plastic art. He himself claimed no other superiority except that of "accuracy of work." We are told that his skill was equally surpassing in representing the grasshopper and the bee as the gods of Olympus. He was a consummate master in marble, bronze, ivory, gold, or ebony; in sculpture, in relief, in engraving, in chasing, in enameling; in colossal statues, and in the most delicate ornamentation of a moulding or a fringe.

The distinguishing characteristic of the art of Phidias was ideal beauty, and that of the sublimest order, especially in the representation of divinities, and of subjects connected with their worship. "While on the one hand," observes Philip Smith, "he set himself free from the stiff and unnatural forms which, by a sort of religious precedent, had fettered his predecessors of the archaic or hieratic school, he never, on the other hand, descended to the exact imitation of any human model, however beautiful; he never represented that distorted action, or expressed that vehement passion, which lies beyond the limits of repose; nor did he ever approach to that almost meretricious grace, by which some of his greatest followers, if they did not corrupt the art themselves, gave the occasion for its corruption in the hands of their less gifted and less spiritual imitators.

Of the four schools of sculpture existing at the commencement of the century of Phidias, two were chief — the school of Æginia and the school of Athens. Art was redeemed from archaic rudeness and developed into perfect beauty: physical beauty in the one school, the fair expression of which is seen in the Æginetan marbles; spiritual beauty in the other, the grand example of which is still seen in the mutilated remains of the Parthenon.

Wherever art is normally developed, it passes through three successive phases — strength, ideal beauty, grace. In the development of Greek art the first is represented by Polycletus, the second by Phidias, the third by Praxiteles. Polycletus wrought out the perfect body; Phidias added to this the noble and beautiful face, the face of the *Jupiter Otricoli*, the *Juno Ludovisi*, the *Minerva Velletri*, the *Venus de Milo*. After his time it became the favorite manner of the artist to make the faces of their statues express pathos or suffering, as in the "Niobe" or the "Laocoon," and to make the bodies of the statues express allurement and grace, as in the *Venus de' Medici,* or the "Faun" of Praxiteles.

"His influence over all subsequent art," observes Frederic Harrison, "was almost equal to that of Homer in poetry. While all subsequent masters and schools had the defects of their qualities, the ancient and the modern worlds have never suggested a shortcoming in Phidias, or a single quality in which he was weak. Consummate judgment and unerring taste control the most sublime and lovely visions of beauty. It is significant that, while his representations of the nude surpass in knowledge and technical mastery any others known, we have no single extant example in which he presented the female form, even partially undraped. His Venus on the frieze, like all his other goddesses, is completely draped. Nor must it be forgotten that we have no single statue by Phidias, in the true sense of the word. The Elgin marbles are all, without exception, architectural decorations. Even the so-called "Theseus" and the "River God," sublime as they are, are the ornaments of a group placed in a pediment, fifty feet above the spectator; and, consequently, like the figures in the metopes or the frieze, they are entirely subordinated to the conditions of the architect.

"Nor are we able to judge whether the great artist was equal to present human expression and emotion with the same power that he has presented the human form. No single head of any of the larger figures that we can certainly ascribe to Phidias has survived uninjured. But in the extant busts of Jupiter we may recognize faint copies of the majesty which he could give to the king of the gods. We cannot assume that even Michaelangelo or Raphael surpassed Phidias in power of expression; and they assuredly did not surpass him in invention, in knowledge, or in sublime and serene beauty. There is every reason to believe that Phidias was the most perfect and complete genius who ever appeared in the arts of form: the one artist in whom we find nothing wanting, and of whom we know no failure."

LEONARDO DA VINCI

A. D.		AGE
1452	Born at Castello da Vinci, Italy,	..
1470	Entered the studio of Verocchio, Florence,	18
1482	Settled at Milan,	30
1493	Finished model for equestrian statue of the duke of Sforza,	41
1498	Completed "The Last Supper,"	46
1500	Returned to Florence,	48
1502	Architect and engineer to Cesare Borgia,	50
1503	Rival of Michaelangelo,	51
1504	Portrait of Mona Lisa,	52
1506	Employed by Louis XII. of France,	54
1514	Summoned to Rome,	62
1516	Entered service of Francis I. of France,	64
1519	Died at Amboise, France,	67

LEONARDO DA VINCI, whose works as a painter are classed with those of Raphael and Michaelangelo, was also a sculptor, architect, scientist, and engineer. He was a natural son of Pietro da Vinci, a notary, and was born at Castello da Vinci, a small village, or burgh, near Florence, Italy, in 1452. His father was at first inclined to educate him for a mercantile career, but, when he discovered the boy's fondness for drawing, he placed him at the age of eighteen with Andrea Verocchio, a very versatile Florentine artist. Verocchio was a sculptor, designer, and painter, and, under his instructions, the pupil soon surpassed the master.

Vasari relates that Verocchio being occupied on a picture of the "Baptism of Christ," Leonardo was permitted to paint an accessory figure of an angel in the same work. Verocchio, perceiving that his own performance was manifestly surpassed by that of his young scholar, abandoned the art in despair, and never touched a pencil again. Although Leonardo thus excelled his master while a boy, and soon enlarged the boundaries of the art, he retained traces of the manner, and even general tastes, of Verocchio all his life. Like his master, he studied geometry with ardor; he was fonder of design than painting. In his choice of form, whether of face or limb, he preferred the elegant to the full. From Verocchio, too, he derived his fondness for drawing horses and composing battles, and from him imbibed the wish to advance his art by doing a few things well, rather than to multiply his works.

During this early period of his career at Florence he produced the "Head of Medusa," the cartoon of "Adam and Eve," a "Madonna," the "Triumph of Neptune," "Adoration of the Magi," and some lesser works. His genius for mechanics had already manifested itself; he invented machines for sinking wells, and lifting and drawing weights; proposed methods for boring mountains, cleansing ports, and digging canals. His architectural schemes, too, were numerous and daring: with the boldness of an Archimedes, he offered to lift the baptistery, or church of S. Giovanni, in the air, and build under it the basement and steps which were wanting to complete the design. It does not appear that his fellow citizens availed themselves of these powers in any memorable work; but his plan for rendering the Arno navigable seems to have been adopted two centuries afterward by Viviani.

Leonardo remained at Florence until about the age of thirty, after which we find him at Milan, in the service of Lodovico Sforza, duke of Milan. The artist's residence at the court of this prince, from 1482 to 1499, may be considered the most active and the most glorious period of his life. Lodovico il Moro — as the duke was often called — whatever may have been his character as a potentate and as a man, certainly gave great encouragement to literature and the arts, and the universal genius of Leonardo was in all respects calculated for the restless enterprise of the time.

All his powers were put in requisition by the duke of Milan. The warlike habits of the sovereigns of Italy at this time rendered the science and services of the engineer particularly useful, and Leonardo was constantly inventing arms and machinery for attack and defense. He was engaged in the architecture of the cathedral; he superintended all the pageants and masques, then so commonly conducted with splendor and taste in the Italian courts, and in some of which his knowledge of mechanics produced almost magical effects. He improved the neighborhood of the Ticino by canals and irrigation, and attempted to render the Adda navigable between Brivio and Trezzo. A colossal equestrian statue of the duke occupied him at intervals for many years. It was finally finished in 1493, and no single work of art of the renaissance called forth such tributes of praise. Want of means alone, it seems, prevented the duke from commissioning him to cast it in bronze; and the model existed until the invasion of Milan by Louis XII., in 1499, when it was broken to pieces by his Gascons.

As the founder of the Milanese academy, the first, in all probability, established in Italy, Leonardo composed his "Treatise on Painting," which Annibale Caracci declared would have saved him twenty years of study had he known it in his youth. This work was first published in Paris in 1651, and contained his studies in optics, perspective, anatomy, libration, and proportion. In this active period of his life were also composed the numerous manuscript books explained by designs, which appear to have comprised specimens of the whole range of his vast knowledge. This academy, of which he was named director, was attended by many eminent artists, and had a very beneficent influence on the Lombard school of painting.

Leonardo's works in painting during his residence in Milan were by no means numerous owing to the number and variety of his occupations. The portraits of Cecilia Gallerani and Lucrezia Crivelli, done in the earlier part of this period, received unbounded praise from the poets of the day. The portraits of Lodovico Sforza, his wife and family, were painted on the wall of the refectory in the convent of Santa Maria delle Grazie, where "The Last Supper" was afterward painted. However, these portraits faded, owing to the dampness of the wall, soon after they were done. Other works in the same place are mentioned by some writers as having been done on canvas, but they all perished from the same cause. The paintings on the walls of the castle of Milan were destroyed by French invaders in 1499. Various portraits and a half figure of St. John are preserved in the Ambrosian library.

In 1496 Leonardo began his greatest work, "The Last Supper," in the refectory of the Dominican convent of Santa Maria delle Grazie, and it was completed within two years. It was painted on the wall in oil, to which circumstance Lanzi and others who have followed him attribute its premature decay. But had it been in fresco, it would probably have suffered as much, since that part of Milan, where the convent stands, has frequently been subject to inundations; and as late as 1800 the floor, or rather ground, of the refectory was several feet under water for a considerable time. The walls have thus never been free from dampness: only fifty years after the picture was painted Armenini describes it as half decayed. From that day to this it has frequently been restored, first by one artist, and then by another, until practically nothing of the original work of Leonardo now remains. Fortunately, numerous copies were made from this painting soon after it was done, the best of which — one by Marco Oggione, now in London — has preserved for us this great masterpiece.

After the fall of Lodovico il Moro, Leonardo returned to Florence, and in 1502 entered the service of Cesare Borgia, the duke of Romagna, as architect and engineer. He remained in Florence thirteen years, occasionally revisiting Milan. Among his first paintings done in Florence at this period were: the cartoon of the "Madonna and Child, St. Anne, and the Infant St. John," and a portrait of Mona, or Madonna Lisa, wife of Francesco del Giocondo. This was the labor of four years, and this, too, was left at last imperfect in 1504. The portrait of Mona Lisa is now in the Louvre, Paris. It is most highly wrought, and resembles the broad softness of Correggio.

Both he and Michaelangelo received commissions to decorate the council hall in the Palazzo della Signoria with historical compositions. Leonardo dealt with "The Battle of Anghiari," a Florentine victory over Milan, and finished his cartoon; but, having employed a method of painting upon the plaster which proved a failure, he abandoned the work in 1506. Michaelangelo's rival work was the celebrated composition known by the name of the "Cartoon of Pisa."

To this period belong, also, his own portrait in the ducal gallery at Florence; the half figure of a nun; the "Madonna, Receiving a Lily from the Infant Christ"; the "Vertumnus and Pomona," miscalled "Vanity and Modesty"; a "Holy Family," now in Russia; the supposed portrait of Joan of Naples; and the "Christ Disputing with the Doctors." His numerous imitators render, however, all decision as to the originality of some of these works doubtful; and the last mentioned picture, now in the national gallery, London, has been thought by more than one writer to have been, at least in part, painted by his scholars. A portrait of the celebrated Captain Giangiacomo Triulzio may have been painted in one of Leonardo's short visits to Milan.

In 1514, after the defeat of the French at Novara, Leonardo, being then at Milan, left that city for Rome, in obedience to a summons from the pope, and again passed through Florence. His stay in Rome was short. Pope Leo X. seems to have been prejudiced against him by the friends of Michaelangelo and Raphael, and was displeased at his dilatory, or rather desultory, habits. From the notes of Leonardo himself, it appears that, while in Rome, he improved the machinery for the coinage; but the only certain painting of his done at this time was a votive picture on the wall of a corridor in the convent of S. Onofrio.

Francis I., who succeeded Louis XII. in 1515, having reconquered the Milanese, Leonardo again went to Milan, in the following year, and once more superintended a pageant, in this instance intended to celebrate the triumph of the king after the victory of Marignano. Francis, having in vain attempted to remove the painting of "The Last Supper" from Milan to Paris, desired at least to have the painter near him. Leonardo accepted the invitation, and afterward accompanied his new patron to France, taking with him his pupils, Salai and Melzi. This was scarcely more than two years before the death of Leonardo, and, as he was occupied in planning canals in the department of the Cher et Loire, he painted little, although the king repeatedly invited him to execute his cartoon of the "Virgin and St. Anne," which was afterward painted by Luini. His usual residence in France was at Cloux, a royal villa near Amboise, in Touraine, where he died May 2, 1519. The story of his having expired in the arms of Francis I., which, as Bossi observes, does more honor to the monarch than to the artist, appears to be without foundation.

He was buried in the church of St. Florent, at Amboise, but no memorial exists to mark the place; and it is supposed that his monument, together with many others, was destroyed in the wars of the Huguenots. At his death he left his manuscripts, library, and other personal property to his pupil, Francesco Melzi.

Leonardo combined in his person an attractive presence and extraordinary powers of mind. He excelled in many physical exercises, was an accomplished musician, and possessed, besides, a captivating eloquence. He was intensely ambitious, haughty, capricious, dreamy, and restless; and undoubtedly it may be laid to his gigantic conceptions, unattainable ideals of perfection, and his insatiable thirst after new achievements, that he left only three or four works of supreme beauty and perfection. Not only every art, but almost every science studied in his time seems to have engaged his attention. He was familiar with chemistry, geometry, anatomy, botany, mechanics, and optics; and there is scarcely a subject that he touched in which he did not, in more or less important points, anticipate the discoveries of later philosophers and scientists. His "Treatise on Painting" has been translated into many languages, and is the foundation of all that has been written on the art.

Hallam, in his *Introduction to the Literature of Europe*, says: "Leonardo's greatest literary distinction is derived from those short fragments of his unpublished writings that appeared not many years since, and which, according at least to our common estimate of the age in which he lived, are more live revelations of physical truths vouchsafed to a single mind, than the superstructure of its reasoning upon any established basis. The discoveries which made Galileo and Kepler and Maestlin and Maurolicus and Castelli and other names illustrious, the system of Copernicus, the very theories of recent geologists, are anticipated by Da Vinci within the compass of a few pages, not, perhaps, in the most precise language, or on the most conclusive reasoning, but so as to strike us with something like the awe of preternatural knowledge."

The works of Leonardo da Vinci are extremely rare. Among them, including those previously mentioned, are a portrait of Charles VIII., long attributed to Perugino; *La Belle Ferronière*, a portrait of Lucrezia Crivelli (in Louvre, Paris); portrait of Mona Lisa, wife of Francesco del Giocondo, celebrated under the name of *La Belle Joconde* (Louvre); "St. John the Baptist" (Louvre); "The Madonna Seated on the Lap of St. Anne" (Louvre); *La Vierge aux Rochers*, of which the original is at Charlton Park, England, the seat of the earl of Suffolk, and copies are in the Louvre, at Naples, and elsewhere; a fresco of the madonna in S. Onofrio at Rome; "The Daughter of Herodias Carrying the Head of St. John the Baptist in a Charger," regarded, however, by some artists as the work of Luini, or of Andrea Solario; "Vertumnus and Pomona," or "Vanity and Modesty," at Rome; "St. Jerome," at Rome; the "Four Evangelists"; the "Head of Medusa," at Florence; a "Leda," sometimes called a "Charity," at The Hague; *La Colombina*, or "Flora"; *La Vierge au Bas-Relief*; and another "Madonna" at St. Petersburg. "Christ Disputing with the Doctors," in the national gallery, London, was long thought to be the genuine work of Leonardo, but it is now universally believed by critics to be by Bernardino Luini. *La Vierge au Fleur-de-Lys*, at Rome, has also been attributed to Luini.

As a painter, Leonardo da Vinci may be considered the first who reconciled minute finishing with grandeur of design and harmony of expression. His was the very poetry of painting. His exquisite taste, by continually making him dissatisfied with his works, urged him on to a nearer approach to perfection than had ever been attained. He imparted to his works certain qualities of the highest kind, for his drawing evinces very great delicacy and elevation of style, not modeled on the antique, but formed on a profound knowledge of nature; and, in his treatment of light and shadow, he infused a degree of power, combined with softness, into his productions that invests them with a peculiar charm. His greatest work — "The Last Supper," or *Cenacola* — is now a mere ruin. But there is reason to hold that it was once the most complete single composition ever produced, and it was undoubtedly the earliest.

It is to be remembered, to the eternal honor of Leonardo, that he first dissipated the film of ignorance which impeded the progress of the arts. He was, unquestionably, the founder of the Italian process of oil painting; and his infinite labor and continued experiments vastly increased the technical resources of the art.

Two centuries had elapsed from Cimabue to Leonardo. The most distinguished artists in the interval were Giotto, who immediately followed Cimabue, and Masaccio, who immediately preceded Leonardo. The latter was, by more than twenty years, the senior of Michaelangelo and Titian, and by more than thirty years the senior of Raphael and Correggio. If Raphael and Michaelangelo afterward surpassed him, it is to him that justly belongs the merit of having first pointed out the road which they so successfully followed. Although we can trace a gradual improvement from the infancy of Tuscan art to the surprising works of Masaccio in the Chiesa del Carmine, at Florence — works which afterward Raphael himself did not disdain to imitate — the appearance of Leonardo may be justly considered the commencement of a new era. Vasari, who composed his famous lives of the painters when the most excellent specimens of the art had been recently produced, emphatically calls the style of Giorgione, Titian, Correggio, and Raphael "the modern manner," as opposed to that of Mantegna, Signorelli, and others, and still more to that of Lippi, Giovanni da Fiesole, and the earlier masters. Of this "modern manner" Leonardo da Vinci was the inventor. His chiaroscuro is to be traced in the magic and force of Correggio and Giorgione; his delicate and accurate delineation of character and his sweetness of expression reappear in Raphael; while, in anatomical knowledge and energetic design, he is the precursor of Michaelangelo. But we look in vain for the teacher from whom he derived these excellences. They were due to his own innate genius; and in this conclusion we are compelled to agree with Hallam, that the name of Leonardo da Vinci stands first in the fifteenth century.

MICHAELANGELO

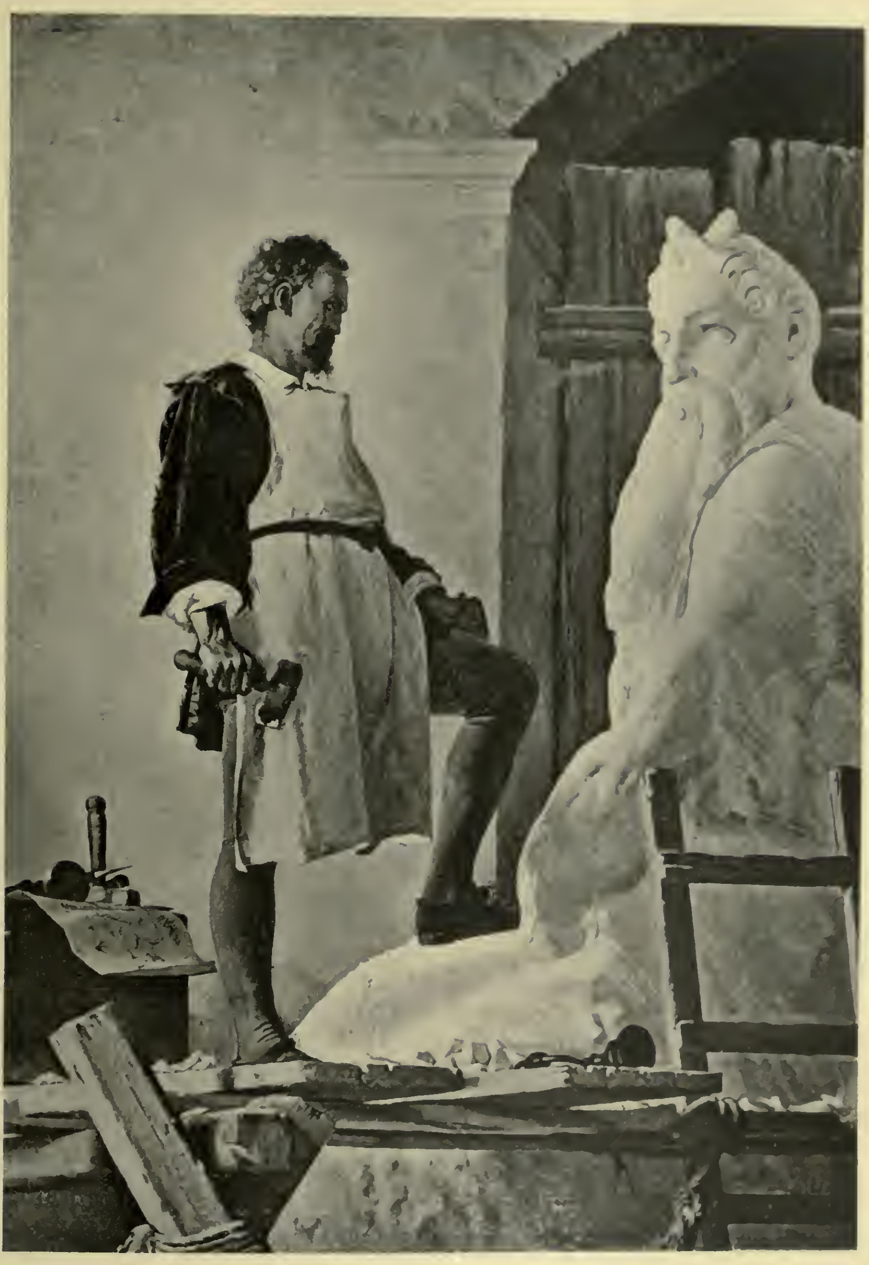
A. D.		AGE
1475	Born at Caprese, Italy,	
1488	Studied under Ghirlandajo,	13
1489	Under the patronage of Lorenzo de' Medici,	14
1503–06	Rivalry with Leonardo da Vinci,	28–31
1504	Finished his "David" at Florence; began monument for Julius II.,	29
1512	Completed frescoes of Sistine chapel,	37
1524	Began the Medici chapel at Florence,	49
1529	Directed defense of Florence against the imperialists,	54
1533–41	"Last Judgment" in Sistine chapel, Rome,	58–66
1547–64	Architect of St. Peters, Rome,	72–89
1564	Died at Rome,	89

MICHAELANGELO BUONARROTI, celebrated as painter, sculptor, and architect, was born at Caprese, near Arezzo, in Tuscany, Italy, March 6, 1475. He was a descendant of an old Florentine family, and, on his mother's side, from the noble Tuscan family of Canossa. At the time of the son's birth, his father was *podestà* or governor of Caprese and Chiusi.

At a very early age Michaelangelo showed indisputable talent, and, when only thirteen years of age, he was apprenticed to the painter Ghirlandajo for three years. As evidence that he must have made considerable progress at that time, instead of having to pay a premium for his tuition, he was paid a small salary for his services. Sculpture, however, seems in a short time to have chiefly engrossed his attention.

Lorenzo de' Medici, the Magnificent, a great lover of art, had established a species of drawing academy in a garden near the church of San Marco. Here the drawings and models of the young Buonarroti attracted his notice, and were of such an order that Lorenzo was induced to give him a room in his own palace, in 1489, and gave him some commissions in sculpture. This noble patronage had no little weight in determining Michaelangelo now to confine his efforts to that branch of art. It was while studying in this academy that a quarrel is said to have occurred between him and the sculptor Torrigiano, who, with a blow in the face, so crushed the nose of Michaelangelo that he was disfigured for life.

After the death of Lorenzo in 1492, Michaelangelo received nearly equal attention from Piero de' Medici; but the political disturbances, which ensued on the change of government, caused the young sculptor to leave Florence for a time and take refuge in Bologna. He also visited Venice, but returned to Florence in 1494. He now rapidly distinguished himself in sculpture; first by his "Sleeping Cupid," sold at Rome to Cardinal Riario as an antique; then by his *Pietà*, or group of "Mary Weeping Over the Body of Christ," now in Rome, where it was executed in 1499. His first visit to Rome was made in 1496, but he returned to Florence in 1501, when he began his colossal "David," which now stands in front of the Palazzo Vecchio, in Florence, and was put in place in 1504. In this gigantic statue he completely displayed that quality



MICHAELANGELO AT WORK ON HIS "MOSES"
From the painting by R. Torrini

in his style of form, which more or less characterizes nearly all his works — a heaviness of the limbs compared with their bodies.

In 1503 a commission, which he received from the gonfaloniere Soderini, to decorate one end of the council hall at Florence as a companion to a similar decoration at the other end intrusted to Leonardo da Vinci, again turned his attention from sculpture to painting, though the famous cartoon of the "Surprise of Pisan Soldiers while Bathing," executed in 1505 for this purpose, was never carried out in the hall. This design, known as the "Cartoon of Pisa," partly preserved in the engravings of Marco Antonio, is extremely spirited, and created a great sensation among the artists at Florence at the time. Benvenuto Cellini calls it "the school of the world."

While this work was in progress, Michaelangelo visited Rome a second time in 1504-05, by the invitation of Pope Julius II., who wished to consult him about his monument, which was to be erected within St. Peter's. The design was too magnificent for the church it was to adorn, and the pope, after some thought, determined to rebuild St. Peter's as a fit covering for his superb monument. On this enormous work, which was never finished as originally planned, he was henceforth engaged, with various interruptions, for a large part of his life. Michaelangelo's masterpiece of sculpture, "Moses," was to form a part of it.

Offended by the treatment he received from some of the pope's servants, however, he returned to Florence without permission, and, in turn, offended the pope. A reconciliation followed at Bologna, where in 1507 Michaelangelo made a bronze statue of Julius, which was afterward converted in 1512 into a cannon by the Bolognese, and used against his holiness himself.

In 1508 he returned to Rome, and was ordered by the pope to paint the vatican chambers in the same year. Michaelangelo wished at first to escape this commission, conscious of his own inexperience, and suggested Raphael as a fitter person; but the pope persisted — urged on, it is said, by the jealousy of Bramante, who wished to show the inferiority of the celebrated Florentine to his countryman, Raphael. If this be true, the scheme signally failed; for Michaelangelo produced the great triumph of his life — the frescoes of the "Prophets and Sibyls," and the "History of the Creation and Fall of Man" — on the vault of this chapel of the popes at Rome.

The chapel is one hundred thirty-three feet long and forty-three feet wide. Michaelangelo at first got some painters from Florence to help him; but, being dissatisfied with their work, he knocked it all down, and executed the frescoes entirely with his own hands. He completed his work in October, 1512, and returned to Florence that same month. In 1513 Julius II. died. Michaelangelo clung to the hope that he would yet complete the great monument; but intrigue and spite were too strong for him, and the famous mausoleum designed by the pope was given up of necessity, and a more modest design was demanded. Other demands were continually made upon his energy, and the sublime statue of "Moses" is the best fragment that is left to us of the tomb of Julius.

During the whole pontificate of Leo X.— Lorenzo the Magnificent's second son, Giovanni de' Medici — Michaelangelo's great powers were wasted. The pope employed him for several years looking out marble at the quarries of Pietra Santa for the façade of the family church of San Lorenzo at Florence; and during the pontificate of Adrian VI., and part of that of Clement VII.— another Medici — beginning about 1524, he was engaged on the Laurentian library and the Medici chapel in San Lorenzo, and on the family mausoleum, where are the celebrated allegorical figures of "Night" and "Morning."

There is no evidence of Michaelangelo's having been in Rome between 1513 and 1525. Part of his time from this period was devoted to improving the fortifications of Florence, used against the pope, Clement VII., in 1529; and, when the city was besieged by the imperialists, he was foremost in its defense. The city surrendered in 1530, and afterward Michaelangelo went to Rome. In 1533, however, in the tenth year of Clement's pontificate, Michaelangelo entered into another compact concerning the ill-fated sepulcher of Pope Julius, whereupon he was again commissioned to adorn the Sistine chapel. He accordingly resumed his painting, and just thirteen years after the death of Raphael, in 1533, commenced his famous fresco of the "Last Judgment," on the altar wall of the Sistine chapel. This great composition is forty-seven feet high by forty-three feet wide, and it occupied the painter about eight years. It was completed in 1541, in the pontificate of Paul III., who in 1535 had made Michaelangelo painter, sculptor, and architect of the vatican palace. He produced no good work in painting after this time. The frescoes of the Pauline chapel, also in the vatican, and finished in 1549, are very inferior works.

He was now chiefly employed as an architect, having in 1547 succeeded Sangallo as architect of St. Peter's; and by the touch of his genius this edifice was converted from a mere Saracenic hall into the most superb model of a Christian church. The great mausoleum of Julius resulted in the simple but noble monument in the church of San Pietro in Vinculis, of which the principal figures are the famous sitting statue of "Moses," already referred to, and "Active Life" and "Contemplative Life" executed by Michaelangelo himself. The "Virgin and Child," the "Prophet," and "Sibyl" were executed by another artist; and the monument was thus finally completed, as modified, in 1550, after more than forty years from the date of the original commission. He altered the plan of St. Peter's, particularly the dome, of which he made the model in 1558, carefully executed to a scale in wood.

The duke of Florence, Cosmo de' Medici, was at this time very anxious to get him back to the Tuscan capital; and, possibly as an inducement, in 1563 he was made vice-president of the academy of Florence, then founded by Cosmo, and of which the duke himself was the president. But Michaelangelo preferred to devote the remainder of his life to the church, which he regarded as a service to the glory of God. He consequently refused all remuneration for this work.

He had also to carry forward at Rome the Palazzo Farnese — one of the most imposing edifices of modern Rome — construct a palace on the Capitoline hill, adorn the hill with antique statues, make a flight of steps to the church of the convent of Ara Cœli, rebuild an old bridge across the Tiber, and convert the baths of Diocletian into the magnificent church of Santa Maria degli Angeli. Under Pius IV. St. Peter's was carried up as far as the dome, but Michaelangelo did not live to see it completed. A slow fever attacked him in February, 1564, and in a few days closed his career. He died on the night of February 17th, having nearly completed his eighty-ninth year. His buoyancy and fertility of mind continued until the last, and just before his death he is said to have drawn an allegorical sketch of an old man, and labeled it *ancora impora*, "still learning." It was the great artist's wish to be buried at Florence, and his body was taken to that city on March 14th, and buried in a vault in the church of Santa Croce.

Michaelangelo was of middle stature, bony in his makeup, and rather spare, although broad over the shoulders. He had a good complexion; his forehead was square and somewhat projecting; his eyes rather small, of a hazel color, and on his brows but little hair; his lips were thin; and, speaking anatomically, the cranium on the whole was rather large in proportion to the face. He wore his beard, which was divided into two points at the bottom, not very thick, and about four inches long; his beard and the hair of his head were black when he was a young man; and his countenance was animated and expressive.

Temperamentally, Michaelangelo was independent, haughty, inflexible, frugal, high-minded, generous, pure, and true. He was never married, but his love for Vittoria Colonna, marchioness of Pescara, is one of the most famous of soul-unions in history, and called out from him some exquisite poetry, of which he was also a master. At evening, after the labor of the day, he wrote sonnets in her praise, and knelt in spirit before her, as did Dante at the feet of Beatrice. She died before him, and for a long time he remained "down-stricken, as if deranged." Several years later his heart still cherished a great grief — the regret that he had not, at her deathbed, kissed her brow or cheek instead of her hand. His sonnets — chiefly inspired by this purely Platonic affair — would even place him in the foremost rank of the lyrical poets of his age.

From his youth he had passionately cherished all noble things: first his art, and next his self-respect. He faced imperious popes, and forced them to regard him as an equal, braving them, says his historian, "more than a king would have done." Ordinary pleasures he held in contempt; although rich, he lived laboriously, as frugally as a poor man, often dining on a crust of bread. Treating himself severely, sleeping but little, and then often in his clothes, he lived without luxury of any kind, without household display, without care for money, gave away statues and pictures to his friends, as well as many thousands of francs to his relatives and servants.

He took great delight in the "arguments of learned men," and in the perusal of the poets — especially Dante and Petrarch, whom he knew almost by heart. The books he preferred were those imbued with grandeur — the old and new testaments — and especially the impassioned discourses of Savonarola, his master and his friend, whom he saw bound to the pillory, strangled, and burned, and whose "living word," he wrote, "would always remain branded in his soul." There are almost endless anecdotes recorded, too, of his caustic wit, proud reserve, and pathetic earnestness. Gherardo Fidelissimi, one of the physicians who attended him, announcing his death to the duke Cosmo de' Medici at Florence, speaks of him as a miracle of nature, and terms him the greatest man that had ever lived upon the earth.

Sublimity of conception, grandeur of form, and breadth of manner are the elements of Michaelangelo's style. By these principles he selected or rejected the objects of imitation. As painter, as sculptor, as architect, he attempted, and above any other man succeeded in uniting magnificence of plan and endless variety of subordinate parts, with the utmost simplicity and breadth. His line is uniformly grand; character and beauty were admitted only as far as they could be made subservient to grandeur. To give the appearance of perfect ease to the most perplexing difficulty was the exclusive power of Michaelangelo. He is the inventor of epic painting in that sublime circle of the Sistine chapel which exhibits the origin, the progress, and the final dispensation of theocracy. He has personified motion in the groups of the "Cartoon of Pisa"; embodied sentiment on the monuments of San Lorenzo; unraveled the features of meditation in the "Prophets and Sibyls" of the Sistine chapel; and in the "Last Judgment," with every attitude that varies the human body, traced the master-trait of every passion that sways the human heart.

Though as sculptor he expressed the character of flesh more perfectly than all who came before or went after him, yet he never submitted to copy an individual, Pope Julius II. only excepted; and in him he represented the reigning passion rather than the man. In painting he has contented himself with the negative color, and, as the painter of mankind, rejected all meretricious ornament. The fabric of St. Peter's, scattered into an infinity of jarring parts by Bramante and his successors, he concentrated; suspended the cupola, and to the most complex gave the air of the most simple of edifices. Such, take him for all in all, was Michaelangelo, the salt of art. Sometimes, no doubt, he had his moments of dereliction deviated into manner, or perplexed the grandeur of his forms with futile and ostentatious anatomy. Both met with armies of copyists; and it has been his fate to be censured for their folly.

Michaelangelo has been styled the "Dante of the arts," and there is, in truth, more than one point of resemblance between him and the illustrious poet. As Dante chose the most difficult subjects to celebrate in verse, and discovered in them beauties which gained for him the epithets of grand, profound, and sublime, so Michaelangelo sought out difficulties in design, and showed himself equally profound and skillful in his mode of surmounting them.

The work of Michaelangelo may be broadly divided into three periods. His youthful period included the creation of the "Bacchus," the South Kensington "Cupid," the "Adonis," the two *Madonne in tondo*, the "Madonna of Bruges," and ended with the execution of the colossal "David" and of the *Pietà* — which showed Michaelangelo at the age of twenty-nine to be the greatest sculptor in Europe — and the "Cartoon of Pisa"— "Bathing Soldiers"— which proclaimed him the greatest draughtsman. His second period was that epoch of tremendous gestation which witnessed the birth of the most potent, fascinating, and dominating painting and sculpture the world had seen for eighteen hundred years, work which warped the talent of a generation of artists — the frescoes of the Sistine chapel, and the sculptures of the Medici tombs in the sacristy of San Lorenzo. To the army of Titans of the vaulting and the seven colossal shapes of San Lorenzo must be added the "Moses," and the so-called "Captives" of the Louvre. His style was determined and had reached its highest point. His final period as painter and sculptor included the "Last Judgment," the frescoes of the Pauline chapel, and the *Pietà*, the "Descent from the Cross," of the duomo of Florence. After the execution of this latter work the sculptor-painter became architect and poet, and laid aside brush and chisel forever.

RAPHAEL

A. D.		AGE
1483	Born at Urbino, Italy, ...	. .
1500	Studied at Perugia under Perugino,	17
1503	"Coronation of the Virgin," . . .	20
1504	*Sposalizio*, or "Marriage of the Virgin"; went to Florence, ...	21
1507	*La Belle Jardinière*; "The Entombment"; "St. Catherine,". .	24
1508	Invited to Rome by Pope Julius II.,	25

1509–11	"Dispute on the Sacrament"; "School of Athens"; "Parnassus,"	26–28
1515–16	"The Cartoons,"	32–33
1517–20	"Sistine Madonna"; "St. Cecilia,"	34–37
1520	"The Transfiguration"; died at Rome, ...	37

RAPHAEL, or, in his own language, Rafaello Santi, is by universal consent the greatest of all painters. He was the son of Giovanni Santi, a poet and painter, and Magia Ciarla, daughter of a merchant, and was born at Urbino, a state of the church, in central Italy, on April 6, 1483.

When only eight years old Raphael lost his mother, and at eleven years of age he had to mourn the death of his father, who had married a second time. His step-mother, and the priest Bartolommeo Santi, his uncle and guardian, appear to have neglected him, but happily he found a sincere friend in his mother's brother, Simone Ciarla, who knew how to appreciate him, and for whom he preserved until his death quite a filial affection.

The career of Raphael is usually divided into three periods, of which the first terminates with his visit to Florence, in the autumn of 1504; the second comprises the time from that date until he was invited to Rome by Pope Julius II., about the middle of 1508; and the third extends to his death in 1520.

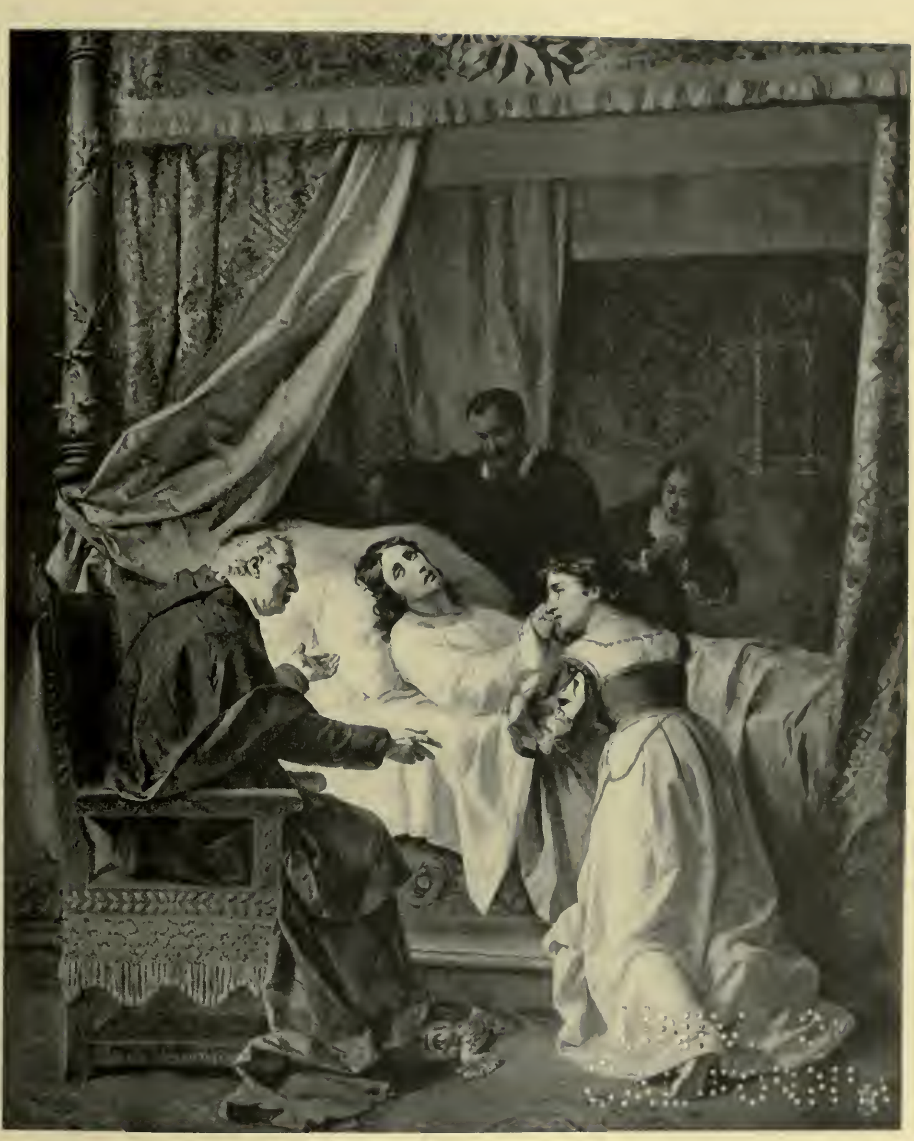
Much uncertainty exists respecting Raphael's early artistic training. It is probable that he received his first instruction from his father. He seems, also, to have studied under Timoteo Viti, and then from about 1500 at Perugia, under Pietro Perugino, the most celebrated painter at that time in Umbria, who was then engaged on the frescoes of the Sala del Cambio, or exchange, at Perugia. Here he adopted and carried to its highest point the tender grace and mystical devotion of that master, often surpassing him in beauty, simplicity, and charm. Other native artists of the Umbrian school probably exercised some influence over the young painter, particularly Fra Carnevale, one of the earliest who attempted perspective, and to whom he may have been indebted for a knowledge of architecture; and Justus van Ghent, a painter of very considerable talent. In 1502 we find him employed at Siena in assisting Pinturicchio, an older pupil of Perugino, although he had little to do with Pinturicchio's frescoes in the famous library at Siena.

The most important of Raphael's paintings during the period at Perugia were the "Crucifixion," the "Coronation of the Virgin," about 1503, now in the vatican at Rome, the celebrated *Sposalizio*, or "Marriage of the Virgin," which latter was executed in 1504, and is now at Milan.

Among other works prior to his removal to Florence are the "Vision of a Knight," in the national gallery, London; the "Adoration of the Magi," at Berlin; "Christ on the Mount of Olives"; and "St. George," and "St. Michael," in the Louvre at Paris.

In October, 1504, Raphael paid his first visit to Florence, carrying with him a letter of introduction from the duchess of Sora, sister of the reigning duke of Urbino. His amiable character, as well as his extraordinary talents, soon procured him the notice and admiration of the Florentine artists. Among his chief friends were Taddeo Gaddi — in return for whose hospitality he is said to have painted the *Madonna del Gran Duca* and the *Madonna Tempi*—Ridolfo Ghirlandajo, and Fra Bartolommeo. With the latter he maintained a friendship which ended only with death, and to which we partly owe the finest works of both.

Meanwhile, Raphael reaped all the improvement which the sight of the excellent works of art in Florence was calculated to communicate. The inspection of the works of Michaelangelo and Leonardo da Vinci enlarged his knowledge of form and his execution, while the inventions of the earlier Florentine masters were diligently examined and remembered. Yet it is here important to remark that he never imitated even the highest examples alluded to, as he had imitated the first models from which he studied. This is naturally to be accounted for in some degree by the greater docility of earlier youth. Much has been written of the inspiration which Raphael caught from Michaelangelo,



THE DYING RAPHAEL
From the painting by Morgari

in Florence, from a sight of the cartoons, and, in Rome, from that of the ceiling of the Sistine chapel; but no direct imitation of Michaelangelo is anywhere to be traced in Raphael, and he seemed desirous rather of exhibiting his own feeling as distinct from that of the great Florentine master than of aiming at that master's style.

The picture he painted at Florence — the "Madonna of the Grand Duke," so called because Ferdinand III. always took it with him on his travels — is almost entirely in his earlier style. The celebrated picture at Blenheim painted in 1505 holds a middle place between Raphael's first and his second, or Florentine manner. It was designed as an altar-piece for a church at Perugia, and represents the madonna and child on a throne, with St. John the Baptist and St. Nicholas of Bari. The chief works executed in Raphael's second, or Florentine manner, about 1507, are the "St. Catherine of Alexandria," in the national gallery, London, "The Entombment of Christ," which is the principal ornament of the Borghese gallery at Rome, *La Belle Jardinière* in the Louvre, Paris, and the *Madonna del Baldacchino*, and *Madonna del Cardellino*, both at Florence. With the exception of a few months passed at Perugia in 1505, and a short interval at Bologna and Urbino in 1506, the whole period from 1504 to 1508 was spent by Raphael in Florence.

In 1508 Pope Julius II., a great patron of the arts, invited him to the eternal city, and received him with the most flattering marks of distinction. Vasari relates that Bramante, the architect of Julius II., being from the same city as Raphael, and distantly related to him, had recommended him to the pope as qualified to paint in fresco certain rooms of the vatican. It is more probable that Raphael's great reputation, now second to none, was the real cause of the pope's notice, although Bramante may have been the medium of communication. To the honor of Julius it should be remembered that he had discernment enough to fix in every instance on the best artists of his age, and he left no means unemployed, sometimes even to an indulgence at variance with the haughtiness of his character, to secure their very best efforts in his service. It is certain that at no period of Raphael's laborious life were his exertions greater than during the reign of Julius II., that is, until 1513, the year of that pontiff's death.

He was first employed on the frescoes in the stanzas of Raphael in the vatican. The first of these works painted in the Stanza della Segnatura was the "Theology," commonly called the "Dispute on the Sacrament." This was probably finished in 1509, and is painted in Raphael's second, or Florentine manner. His later works, including all the other vatican frescoes, are painted in his third manner, or in that style which peculiarly characterizes him, and constitutes the Roman school in its highest development. They are distinguished for dramatic composition and expression, for correct and vigorous design, and, at least in the frescoes, for a grand and appropriate tone of coloring.

In the Stanza della Segnatura are also the frescoes of "Poetry," or "Parnassus"; "Philosophy," or the "School of Athens"; and "Jurisprudence." They were all finished in or before 1511. In the second chamber, known as the Stanza del Eliodoro, are "The Expulsion of Heliodorus from the Temple of Jerusalem"; the "Miracle of Bolsena"; "The Repulse of Attila by Pope Leo I."; and "St. Peter released from Prison." The two former were painted in 1512 during the lifetime of Pope Julius II.; the two latter were painted in 1513 and 1514 during the pontificate of Leo X.

Before the frescoes of the second stanza were completed, Julius II. died and was succeeded in 1513 by Leo X. Though the character of Pope Leo X. was in all respects different from that of Julius, he was not a less patron of Raphael than his predecessor had been; and certainly the number of learned and accomplished men whom he attracted to his court, and the enthusiasm for classical learning which prevailed among them, strongly influenced those productions of Raphael which date from the accession of Leo. They became more and more allied to the antique, and less and less imbued with that pure religious spirit which we find in his earlier works.

Cardinal Bembo, Cardinal Bibbiena, Count Castiglione, the poets Ariosto and Sanazzaro, ranked at this time among Raphael's intimate friends. With his celebrity his riches increased; he built himself a fine house in that part of Rome called the Borgo, between St. Peter's and the castle of St. Angelo; he had numerous scholars from all parts of Italy, who attended on him with a love and reverence and duty far beyond the lip and knee homage which waits on princes; and such was the influence of his benign and genial temper that all these young men lived in the most entire union and friendship with him and with each other, and his school was never disturbed by animosities and jealousies. All the other painters of that time were the friends rather than the rivals of the supreme and gentle Raphael, with the single exception of Michaelangelo.

About this period, the beginning of the pontificate of Leo X., Michaelangelo had left Rome for Florence. Leonardo da Vinci came to Rome by the invitation of Leo, attended by a train of scholars, and lived on good terms with Raphael, who treated the venerable old man with becoming deference. Fra Bartolommeo also visited Rome about 1513, to the great joy of his friend. Raphael at this time was on terms of the tenderest friendship with Francia, and in correspondence with Albrecht Dürer, for whom he entertained the highest admiration.

Under Leo X. Raphael continued his great work in the vatican, assisted by his scholars. The third chamber, called the Stanza del Incendio, was now painted — almost wholly by Raphael's scholars; and the fourth, called the Sala di Constantino, was completed from designs of Raphael, after his death, under the direction of Giulio Romano. Of all the vatican works the "Attila" is justly considered to be the most perfect example of fresco painting, and to exhibit the greatest command over the material. Though produced after the death of Julius, it may be regarded as the noblest result of that impulse which the pontiff's energy had communicated to Raphael.

The celebrated cartoons are the original designs executed by Raphael and his scholars in 1515 and 1516, as copies for tapestry work for Pope Leo X. The tapestries, worked in wool, silk, and gold, were hung in the Sistine chapel at Rome in 1519, the year before Raphael died, and excited the greatest applause. Seven of the cartoons remained neglected in the warehouse of the manufacturer at Arras, and were there seen by Rubens, who advised Charles I. to purchase them. These exquisite compositions are now in the South Kensington museum, London. The subjects are: "Christ's Charge to Peter," "The Death of Ananias," "Peter and John Healing the Lame Man," "Paul and Barnabas at Lystra," "Elymas the Sorcerer Struck Blind," "St. Paul Preaching at Athens," and "The Miraculous Draught of Fishes."

Whether from the indifference of Leo, or from his neglect, as Vasari hints, to discharge his pecuniary debts to Raphael, we soon find the painter employed on various other works, and the remaining frescoes of the vatican bear evidence of the frequent employment of other hands. Many works of minor importance in the vatican were entirely executed by his assistants. The first portrait of Leo with the cardinals De' Medici and De' Rossi completes the list of larger works undertaken for the pope.

Among the numerous and extensive works done for other patrons by Raphael — all in his third manner — are the frescoes in the Farnese palace; the "St. Cecilia," at Bologna; the portrait of Julius II., in the national gallery, London; the "Madonna, Infant Christ, and St. John," now called the "Garvagh Raphael," in the same collection; the celebrated "Sistine Madonna," at Dresden; the *Spasimo*, at Madrid; the *Madonna del Pesce*, at Madrid; the *Madonna di Foligno*, in the vatican; the *Madonna della Sedia*, at Florence. Many a palace in the neighborhood of Rome still exhibits remains of frescoes for which Raphael at least furnished the designs. A long list of portraits might be added to the above works, together with many interesting designs in architecture and even some productions in sculpture.

At this time the lovers of painting at Rome were divided as to the relative merits of Michaelangelo and Raphael, and formed two great parties, that of Raphael being by far the more numerous. Michaelangelo with characteristic haughtiness disdained any open rivalry with Raphael, and put forward the Venetian Sebastiano del Piombo as no unworthy competitor of the great Roman painter. Raphael bowed before Michaelangelo, and, with the modesty and candor which belonged to his character, was heard to thank heaven that he had been born in the same age and enabled to profit by the grand creations of that sublime genius, but he was by no means inclined to yield any supremacy to Sebastiano; he knew his own strength too well. To decide the controversy, the cardinal Giulio de' Medici, afterward Clement VII., commissioned Raphael to paint the picture of "The Transfiguration," and at the same time commanded from Sebastiano del Piombo the "Raising of Lazarus," which is now in the national gallery, London. Both pictures were intended by the cardinal for his cathedral at Narbonne, he having lately been created archbishop of Narbonne by Francis I. Michaelangelo, well aware that Sebastiano was a far better colorist than designer, furnished him with the cartoon for his picture, and, it is said, drew some of the figures (that of Lazarus for example) with his own hand on the panel; but he was so far from doing this secretly that Raphael heard of it, and exclaimed, joyfully, "Michaelangelo has graciously favored me, in that he has deemed me worthy to compete with himself, and not with Sebastiano!" But he did not live to enjoy the triumph of his acknowledged superiority, dying before he had finished his picture, which was afterward completed by the hand of his pupil, Giulio Romano.

During the last years of his life, and while engaged in painting "The Transfiguration," Raphael's active mind was employed on many other things. He had been appointed by the pope to superintend the building of St. Peter's, and he prepared the architectural plans for that vast undertaking. He was most active and zealous in carrying out the pope's project for disinterring and preserving the remains of art which lay buried beneath the ruins of ancient Rome. He also made several drawings and models for sculpture, and, with a princely magnificence, sent artists at his own cost to various parts of Italy and into Greece to make drawings from those remains of antiquity which his numerous and important avocations prevented him from visiting himself. He was in close intimacy and correspondence with most of the celebrated men of his time; interested himself in all that was going forward; mingled in society, lived in splendor, and was always ready to assist generously his own family and the pupils who had gathered round him. Cardinal Bibbiena offered him his niece in marriage, with a dowry of three thousand gold crowns; but the early death of Maria di Bibbiena prevented this union, for which it appears that Raphael himself had no great inclination.

In possession of all that ambition could desire, for him the cup of life was still running over with love, hope, power, glory, when, in the very prime of manhood, and in the midst of vast undertakings, he was seized with a violent fever — caught, it is said, in superintending some subterranean excavations — and expired after an illness of fourteen days. His death took place on Good Friday — his birthday — April 6, 1520, when he had completed his thirty-seventh year. Great was the grief of all classes; unspeakable that of his friends and scholars. The pope had sent every day to inquire after his health, adding the most kind and cheering messages; and, when told that the beloved and admired painter was no more, he broke out into lamentations on his own and the world's loss. The body was laid on a bed of state, and above it was suspended the last work of that divine hand, the glorious "Transfiguration." From his own house near St. Peter's a multitude of all ranks followed the bier in sad procession, and his remains were laid in the church of the Pantheon, near those of his betrothed bride, Maria di Bibbiena, in a spot chosen by himself during his lifetime.

Raphael was about five feet eight inches in height. He had a regular, agreeable, and delicate face, the features well proportioned, the hair brown, the eyes of the same color, full of sweetness and modesty. The tone of the face bordered upon the olive. His expression was that of grace and sensibility. The rest of his conformation appears to have been completely in harmony with his physiognomy. His neck was long, his head small, his frame feeble. Nothing in him indicated a constitution of long duration. His manners were full of charm; his exterior was prepossessing; and his style of dress elegant. His sincere modesty was not diminished by his admission as an equal by the princes of the church, the distinguished scholars, and the world-famed men of every class who formed the courts of Julius II. and Leo X.

In accordance with the spirit of the age, Raphael lived with considerable display and luxury, and was approached with the utmost deference by the ambassadors of foreign princes, whether their masters desired a picture, or some form of favor. It is related that the duke of Ferrara even sent to consult him on the best cure for smoky chimneys.

To his pupils he was as a father. They formed round him a sort of royal retinue, numbering many youths, each talented in some branch of the arts. Giulio Romano and Gianfrancesco Penni, his two favorite pupils, lived with him in the Palazzo di Bramante, where he resided during the greater part of his life in Rome. This fine palace, designed by the celebrated architect Bramante, was destroyed in the seventeenth century at the same time as Raphael's Palazzo dell' Aquila.

At his death he left property to the value of sixteen thousand ducats, a large fortune at that time. His painting materials and works of art he bequeathed to his favorite pupils, Penni and Romano, then both young men, on condition of completing his unfinished works. In 1527 his numerous pupils dispersed. Giulio Romano established his style at Mantua, and Penni carried it to Naples; Caravaggio spread it to Sicily; Garofalo early introduced it into Farrara, and Pierino del Vaga founded a school upon its principles at Genoa.

Yet, in an important sense, he founded no school of art; for as Baron von Walzogen observes: "When Raphael's divine form — he was called by his countrymen *il Divino*, 'the Divine'— walked the earth, painting then stood above all as the highest acquisition to which the Romanic nations had ever attained. The bond between religion and beauty, heaven and earth, was concluded. And yet this glorious prime contained in itself the germ of its dissolution. The soul of Italian art perished, when the noble author of that incomparable bond was snatched from earth. Because he had summed up in himself all the perfections of former times, there was only a fragmentary sundering of his universal aims left behind him on the field of art. Raphael forms no school, because he is the end and close of an era in mental development. All that could be expressed within the sphere of art which he embraced was expressed by him. His pupils are indeed only pupils, who cultivate his manner."

When we consider the immense field over which his labors were spread, and the strong personal individuality which appears in all these varied branches of art, together with the almost incredible number of paintings that issued from his studio, it will be seen that he must have labored with an amount of unflagging industry which has perhaps never been surpassed, and that, too, in a time and in a city of which the social habits and luxurious splendor certainly threw every possible temptation in the way of steady application and regular work.

Among all the painters of the world none has been so universally popular as Raphael, or has so steadily maintained his preëminent reputation throughout the many changes in taste which have taken place in the last four centuries. Apart from his combined merits as a draughtsman, colorist, and master of graceful composition, he owes the constancy of admiration which has been felt for him, partly to the wide range of his subjects, but still more to the wonderful varieties of his style.

If the authorship of his paintings were unknown, no one would guess that the *Sposalizio*, the *Madonna del Baldacchino*, and "The Transfiguration" could possibly be the work of one painter. In his earliest pictures he touches the highly spiritual and sacred art of the Perugian Fiorenzo di Lorenzo, while in his latest Roman work he is fully embarked in the pagan spirit of the last development of the renaissance, already on the brink of the most rapid decline. In the seventeen or eighteen years which composed his short working life, he passed through stages of development for which a century would not have seemed too long, while other painters lived through the same changeful time with but little alteration in their manner of work.

In versatility of power Raphael, as a painter, remains almost without a rival. Whether painting an altar-piece for a church, a large historical fresco, a portrait, or decorative scenes from classical mythology, he seems to excel equally in each. Besides, the widely different methods of painting in temper, oil, or fresco are employed by him with apparently equal facility. His range of scale is no less remarkable, varying from a miniature, finished like an illuminated manuscript, to colossal figures in fresco dashed in with inimitable breadth and vigor.

"The character of his pencil, its versatility and its purity are sufficient signs," remarks Kugler, "of his marvelous endowments. No master has left so many works of the highest rank in art — no other so little that is defective or unattractive. He represents a purity and refinement of feeling and form unattained before and unequaled since, and in the combination of which, with power of hand and grasp of mind, he stands alone."

"In his art," says Hazlitt, "he seemed to pour out all the treasures of nature — grandeur and scope of design, exquisite finishing, force, grace, delicacy, the strength of man, the softness of woman, the playfulness of infancy, thought, feeling, and invention. He received his inspiration from without, and his genius caught the lambent flames of peace, of truth and grandeur, which are reflected in his works with a clear light, transparent and unfading."

TITIAN

A. D.		AGE
1477	Born at Capo del Cadore, Italy,	..
1487	Began study under Bellini at Venice,	10
1502	Produced his first Antwerp altar-piece,	25
1512	Chief of Venetian painters; "Sacred and Profane Love,"	35
1514	"The Tribute Money,"	37
1518	Finished the "Assumption,"	41
1518–23	Employed by duke of Ferrara,	41–46
1525	Married,	48
1530	"Death of Peter, Martyr;" met Emperor Charles V. at Bologna,	53
1545	Invited to Rome by Pope Paul III.,	68
1548	Visited Charles V.,	71
1576	Died at Venice,	99

TITIAN, or TIZIANO VECELLI, was the greatest painter of the Venetian school, and one of the most celebrated of all painters. Like Raphael, he was also styled "the divine," but many of the facts concerning his life are very obscure. He was born at Capo del Cadore, a mountainous district of Venetia, Italy, in 1477, son of Gregorio di Conte Vecelli, a man of some note in his province as a soldier and councilor.

Titian showed an early disposition toward art, and, therefore, he was not brought up to arms or the law like the rest of his race. When a child of nine or ten years old he was taken to the house of Sebastian and Francis Zuccati at Treviso, to be instructed by them in the principles of drawing. The brothers Zuccati, however, were chiefly masters in mosaic work — which they had brought to the highest degree of perfection — and Titian, being more inclined to painting, was soon removed to the tuition of Gentile Bellini at Venice. He could not endure, however, to follow the dry and labored manner of Gentile, and applied to his brother Giovanni Bellini, under whose guidance he made rapid progress. Indeed, he was soon able to imitate his master's style so exactly that their works could scarcely be distinguished.

To be sure, this style was stiff and dry, but, guided by his own genius, by the study of nature, and by the example of Giorgione, his older fellow pupil, he was not long in acquiring a bolder touch and a more vigorous manner. To the latter, indeed, he was indebted chiefly for the ideas of color and art by which he was long governed; and such was his facility that he soon vied with Giorgione, also. This competition later became so keen that all connection was broken off between them.

It is probable that Titian first employed his talents as a painter and decorator of the palaces of the great Venetian nobles. It was the custom of the time to adorn the outside of Venetian palaces with frescoes and other decorative work; and the first reference to his work is in connection with the Morosini palace. His "Pope Alexander VI. Commending Jacopo Pesaro to the Madonna," an altar-piece at Antwerp, was produced in 1502 or 1503.

From 1507 to 1508, with Giorgione, he was engaged in the decoration of the new Venetian exchange; and here among other works he painted a fresco above the gateway, variously called "Judith," "Justice," and "Germania," which was considered a remarkable figure by early critics. In the latter part of the period closing with the year 1512, he produced "Sacred and Profane Love," now one of the celebrated pictures of the Borghese gallery in Rome, and probably more properly called "Medea and Venus." During this period is placed also, about 1514, his great painting, "The Tribute Money," one of his most carefully finished pictures. The "Assumption of the Virgin," one of the grandest of his achievements, was begun in 1516 and finished about two years later.

After the death of Giovanni Bellini in 1516, the Venetian government employed Titian to finish a composition which that painter had left imperfect. It represents the "Homage of the Emperor Frederic Barbarossa to Pope Alexander III." The senate recompensed Titian by giving him the office of broker to the German exchange — a lucrative post which was usually conferred on the most eminent painter of the city.

Titian's reputation soon spread throughout the whole of Italy. In 1513 the duke Alphonso I. of Ferrara, who was embellishing his palace of Castello, employed the best masters he could press into his service in order to render that abode worthy of the magnificence of a great prince. Giovanni Bellini was the first to receive a commission for this work. Between 1518 and 1523 Titian executed for the duke Alphonso three famous mythological pictures, "Worship of Venus," a "Bacchanal," and "Bacchus and Ariadne." While at Ferrara he also painted a portrait of Ariosto, the poet, and probably one of the duke's wife, the celebrated Lucrezia Borgia. Invitations from Pope Leo X., and also from Raphael, to visit Rome, were declined. Another invitation from Francis I., king of France, was also declined, as Titian always preferred domestic happiness to the most brilliant promises of fortune.

During the period from 1520 to 1530, the most celebrated of his numerous productions were: "Death of Peter, Martyr," a work of unsurpassed beauty, finished about 1530; "Victory of the Venetians over the Janizaries;" and "St. Sebastian." In 1530 Aretino, the poet, introduced him to the notice of the emperor Charles V., and he went to Bologna to paint the portraits of the emperor and Pope Clement VII. Charles not only granted him a pension, but sent him, at a later date, the cross of chevalier and the diploma of Count Palatine. When his courtiers made envious remarks about the deference he paid Titian, the emperor replied: "I can easily create a duke, but where shall I find another Titian?" On another occasion when the artist dropped his pencil, the emperor hastened to pick it up, and presented it with the remark: "Titian is worthy of being served by Cæsar!"

Although Titian received repeated invitations to Rome, he does not appear to have gone there until 1545, when he was received with great distinction by Paul III., by Cardinal Farnese, who had been trying for some time to lure him to the holy city, and by his learned friend, Cardinal Bembo. Rooms were assigned him in the Belvedere, that he might have easy access to the Farnese family, and Vasari acted as his guide to the city. During his residence in Rome — where he remained three years — the most important of his pictures were the portraits of Pope Paul III. with his grandsons, Cardinal Alessandro and Duke Ottavio Farnese.

Charles, who seemed unable to do without Titian, summoned him on two future occasions to Augsburg — in 1548 and 1550 — and once to Innsbruck. At Augsburg he painted the equestrian portrait of Charles V. in full armor — a wonderful characterization of the irresistible but disappointed master of Europe in the sixteenth century. After the second summons to Augsburg he painted the portrait of Philip II. as a prince in armor. He seemed to reciprocate the extreme intimacy and friendship of the world-weary Charles V., and this relationship resulted in the design of the "Trinity," the emperor's last commission to Titian.

The latter part of Titian's life was occupied in working at Venice chiefly for Philip II. of Spain, for whom, besides portraits, he painted several religious and mythological subjects. Among these works were: a "Last Supper," "Christ in the Garden," "St. Margaret with the Dragon"; besides "Venus and Adonis," "Medea and Jason," and other classic canvases.

His splendid vigor of constitution and indomitable energy seems never to have failed, and it is not until the last years of his life that we see any signs of decay in his art. Vasari found him in 1566 with the brushes still in his hand, and even in 1574, when he was ninety-seven years of age, he was able to receive a royal visitor — Henry III. of France — with his wonted magnificence. In 1576, when he was only one year short of a hundred, he succumbed at last to a terrible plague which visited Venice in that year and carried off both himself and his painter son, Orazio. The law stipulated that the churches of Venice should be closed to the plague-stricken, but it was set aside in the case of Titian, and he was buried with great pomp in the church of the Frari, in which were his great "Assumption," and his beautiful votive painting, the *Madonna di Casa Pesaro.*

Very little is known of Titian's domestic life. He married in 1525 when forty-eight years of age, but his wife died in 1530 leaving three children. One son took priest's orders; the other followed his father's profession; and his beautiful daughter, Lavinia, has been immortalized by her father's brush. Shortly after the death of his wife, he seems to have changed his mode of life. He purchased a home in the Venetian suburb of Biri, where his children were brought up under the care of his sister Orsa. In this home he lived with great hospitality and splendor, surrounded by men of eminence — poets, painters, and soldiers — among others Ariosto, Sansovino, and Aretino, and even kings.

In personal appearance, Titian was commanding and attractive. He had a high forehead, bold projecting brow, strong arched nose finely cut, penetrating eyes, and, in middle and later life, a beard and moustache. He loved pleasures, but in moderation. His nature was noble, generous, affectionate, and joyous, though both luxurious and improvident.

The works of Titian are said to number upward of six hundred. As a portrait painter he has never been surpassed, and as a master of color he is the greatest that the world has known. Nearly every great potentate of Europe of the sixteenth century was painted by him; and soldiers, statesmen, poets, and ecclesiastics almost without number were among his sitters. Perhaps the most remarkable picture existing of any individual is Titian's portrait of "The Emperor Charles V. on Horseback," in the Madrid gallery.

With Titian commenced that form of fancy female portraits, which, under various disguises, afforded opportunity for the delineation of youth and beauty. Among these are the so-called "Daughter of Titian"; "Salome"; "Titian and his Mistress"; *La Bella di Tiziano;* and "Flora."

He also excelled in landscape; and no less celebrated an authority than Ruskin says that "all landscape grandeur vanishes before that of Titian and Tintoretto." His religious pictures, too, are numerous and magnificent, some of them on a large scale, and he frequently chose mythological subjects. Some of his finest works are poetical or allegorical. His taste in design was the least conspicuous part of his merit, and it is a matter of record that even his contemporaries regretted that he had not visited Rome at an early period of his life so that this defect might have been corrected. "Had he been at Rome," observed Piombo, "and seen the works of Michaelangelo, those of Raphael, and the antique statues, and attended more to correct drawing and proportion, he would have produced miraculous works, seeing the practice he had in coloring, and his being undoubtedly the most faultless imitator of nature of his time. Could he but have acquired correctness of outline, the world would then have seen a perfect painter."

Posterity has placed Titian by the side of Raphael and of Correggio. If he yields to the former in the ideal beauty of forms and the philosophy of expression, and to the latter in chiaroscuro, he is superior to them both in coloring and faithful imitation of nature. His special mark is the complete and harmonious perfection of his method, his equal mastery of all the sides of art, and of all subjects, whether in the realm of nature or of man. There is a stately repose, a glowing nobility, and an unerring judgment in his masterpieces. He is, of all painters, the one who has the fewest defects in his qualities, and is the least open to criticism; that one who, as master of the brush, still stands supreme. Titian never wearies us, never exaggerates, has no kind of mannerism, and never fails in dignity. Wanting as he is in profound imagination and passion, his joyous sympathy with all forms of beauty and of life, his splendid sense of color, his dignity and grace, make him equal to the most varied and the noblest tasks.

"Titian's art," says John Addington Symonds, "is a golden mean of joy, unbroken by brusque movements of the passions — a well-tempered harmony in which no thrilling note suggests the possibility of discord. In his work the world and men cease to be merely what they are; he makes them what they ought to be; and this he does by separating what is beautiful in sensuous life from its alloy of painful meditation and of burdensome endeavor. The disease of thought is unknown in his kingdom; no divisions exist between the spirit and the flesh; the will is thwarted by no obstacles. When we think of Titian, we are irresistibly led to think of music. His 'Assumption of the Madonna'— the greatest single oil-painting in the world, if we except Raphael's *Madonna di San Sisto* — can best be described as a symphony — a symphony of color, where every hue is brought into harmonious combination — a symphony of movement, where every line contributes to melodious rhythm — a symphony of light without a cloud — a symphony of joy in which the heavens and earth sing hallelujah.

"Tintoretto, in the Scuola di San Rocco, painted an 'Assumption of the Virgin' with characteristic energy and impulsiveness. A group of agitated men around an open tomb, a rush of air and clash of seraph wings above, a blaze of glory, a woman borne with sidewise-swaying figure from darkness into light — that is his picture, all *brio*, excitement, speed. Quickly conceived, hastily executed, this painting bears the impress of its author's impetuous genius. But Titian worked by a different method. On the earth, among the apostles, there is action enough and passion; ardent faces straining upward, divesting themselves of their mantles, as though they, too, might follow her they love. In heaven is radiance, half eclipsing the archangel who holds the crown, and revealing the father of spirits in an aureole of golden fire. Between earth and heaven, amid choirs of angelic children, rises the mighty mother of the faith of Christ, who was Mary and is now a goddess, ecstatic yet tranquil, not yet accustomed to the skies, but far above the grossness and the incapacities of earth. Her womanhood is so complete that those for whom the meaning of the Catholic legend is lost may hail in her humanity personified.

"The grand manner can reach no further than in this picture — serene, composed, meditated, enduring, yet full of dramatic force and of profound feeling. Whatever Titian chose to touch, whether it was classical mythology or portrait, history or sacred subject, he treated in this large and healthful style. It is easy to tire of Veronese; it is possible to be fatigued by Tintoretto. Titian, like nature, waits not for moods or humors in the spectator. He gives to the mind joy of which it can never weary, pleasures that cannot satiate, a satisfaction not to be repented of, a sweetness that will not pall. The least instructed and the simple feel his influence as strongly as the wise or learned."

1629	Painter and diplomatic envoy for Charles I. of England,	52
1630	Married his second wife,	53
1640	Died at Antwerp,	63

PETER PAUL RUBENS, greatest of the Flemish painters, and the most versatile of all the celebrated artists, was born at Siegen, in Westphalia, Prussia, June 29, 1577. He was the son of Jan Rubens, a lawyer, and Mary Pypeling, and the time of his birth came in the midst of a period of great domestic trouble and disgrace in his immediate family.

Jan Rubens had been chosen secretary to William the Silent, and on account of a *liaison* between Rubens and Princess Anne of Saxony, wife of William, he was first imprisoned, and then "interned" in the little town of Siegen. This favor — for it was a favor to Jan Rubens to live no longer in a prison — had been granted to him at the urgent request of his wife, who, generously forgetting the wrongs he had inflicted on her, asked that he should be allowed to undergo his punishment with her, and in liberty. But this public captivity, which at first seemed sweet to the prisoner, soon became almost insupportable, and in 1578 he obtained leave to fix his residence at Cologne, where he died in 1587.

In the year following the death of her husband, Rubens's mother removed to Antwerp; where her boy was educated in the Jesuit college, and later became a lay brother. To this institution he was indebted for his excellent classical training, and possibly, too, for the practical turn which he exhibited on a number of occasions in future years. It was at first intended by his mother that he should take up the law, but his predilection in favor of art led him to enter the studio of Otto Venius (or van Veen) about 1596, when he was nineteen. He had previously received some art training under Tobias Verhaeght, a landscape painter, and also under Adam van Noort.

In 1598 Rubens entered the guild of St. Luke at Antwerp, and started for Italy in the spring of 1600, where he spent about eight years, at Venice, Mantua, Rome, Florence, and Genoa, and painted numerous pictures. He made Venice his first halting place, specially attracted by the great Italian colorists. At Mantua he became court painter to Duke Vincenzo Gonzaga, and became familiar with the manners of courts — a natural element to the future diplomatist. Here he was occupied in copying the most magnificent examples from Giulio Romano's hand, and later proceeded to Rome to make copies of the old masters. While in Rome he also executed several altar-pieces for the archduke Albert, governor of the Netherlands.

In 1603 he left Mantua on his first mission to Madrid, deputed by the duke Vincenzo Gonzaga to Philip III. to take charge of some beautiful horses which were intended for the king, but secretly intrusted to convey a large Mantuan bribe to the duke of Lerma, then prime minister of Spain. After his return to Italy he resided successively at Rome, Florence, Milan, and Genoa. At Genoa he painted the "Miracles of St. Ignatius," a work of great splendor and merit; at Milan he made drawings of Leonardo da Vinci's "Battle of Anghiari" and "Last Supper," both now in the Louvre, Paris; and at Rome he continued his studies of the masters, and painted a highly finished "St. Jerome."

On the death of his mother in 1608, he returned to Antwerp, where, by the persuasion of the archduke Albert and the infanta Isabella, he was induced to take up his residence, accepting the title of official painter with a salary of five hundred florins. In the year 1609 he married his first wife, Isabella Brandt, the niece of his brother Philip's wife. In a splendid portrait, produced the next year, she is depicted with himself on the celebrated canvas now in the Pinakothek at Munich.

In the street which bears his name stand portions of the palatial residence in which the rest of his life was spent. It was bought by him in 1611, and, with the exception of the months occupied by his embassies into Spain and England, and some other short journeys, there he dwelt, there the great pictures began to live under his hand, there, according to his own boast, he coined gold with the palette and the pencil, and there, in the ripeness of a good old age, this "prince of painters and gentlemen" died.

During the preceding year Rubens had received his first important commission. It came from his adopted city, in whose city hall he painted the "Adoration of the Magi," an immense canvas in glowing color, now in the Prado at Madrid. He painted in the same year the San Ildefonso altar, and the "Elevation of the Cross," two of his most famous pieces. In 1612 followed his conceded masterpiece, "The Descent from the Cross," for the Antwerp cathedral. The latter subject in modified form is also to be found in the Hermitage of St. Petersburg, where there is to be found likewise his "Perseus and Andromeda," the most successful of his mythological pictures.

During this period of his career Rubens completed the exquisite "Madonna Surrounded by Children," in the Louvre, Paris, and the playful "Children with a Fruit Garland," in the Pinakothek at Munich. In 1614 the "Flight into Egypt" and the *Pietà* of the Vienna museum were produced.

After he settled at Antwerp, pupils flocked to his studio in such numbers that he was compelled to recommend many of them to other masters. His patronage kept on constantly increasing, and he availed himself of the assistance of his most accomplished students in the execution of the larger paintings and replicas in demand. He frequently, also, collaborated with other artists — notably with Breughel and Frans Snyders — and the extent and range of his productive powers, thus augmented during the years from 1615 to 1622, were most remarkable.

In conjunction with Snyders he produced the spirited "Boar Hunts," in the Dresden and Munich galleries, and the "Chase of Diana," in the Berlin museum. His "Lion Hunt" in the Pinakothek shows that Rubens was an animal painter of the first rank.

In 1621 he received a commission from Marie de' Medici to adorn the gallery of the palace of the Luxembourg at Paris, for which, with the aid of his pupils, he executed the well-known series of paintings, exhibiting the principal events of the life of that princess. The whole, comprising twenty-four paintings, was completed in four years.

In 1627 he was sent by the infanta Isabella to The Hague, to ascertain from Sir Balthasar Gerbier, the agent of Charles I. of England, whether an agreement could not be effected between England and Spain, which powers had been at war for some time. In 1628, with the same object in view, he was despatched on diplomatic missions to Philip IV. of Spain, and in 1629 to Charles I. of England, and, eventually, had the satisfaction of bringing the negotiations for peace between the two countries to a successful termination. Both these sovereigns bestowed upon him signal marks of favor, and did not overlook in the ambassador the talents of the painter. At Madrid he met Velasquez, the famous Spanish painter; and at London Charles I. engaged him to paint the ceiling of the banqueting hall at Whitehall, the design being the apotheosis of James I. His allegory of "Peace and War," now in the national gallery, "St. George," and other works, were also presented by him to the king, who conferred upon him the honor of knighthood, giving him at the same time the royal sword and a massive gold ring. On leaving England Rubens again visited Madrid, to explain to Philip the means by which he had brought about so happy a result to the negotiations. Here he renewed the study of Titian, which strongly influenced the works of his later period.

In 1626 his wife died, leaving him two sons; and in November, 1630, he married his second wife, Hélène Fourment, a niece of his first wife, a beautiful girl of sixteen, who bore him two more sons, and three daughters. He has preserved her features for us in numerous portraits, which he never tired of painting at various stages.

In 1635 he designed the decorations which celebrated the entry of the cardinal infant Ferdinand into Antwerp as governor of the Netherlands; and in 1639 completed the "Crucifixion of Peter," in the church of that saint at Cologne. His *Santa Conversazione* for the altar of his mortuary chapel, one of his latest and finest works, belongs to the same year.

After a career marked by all the distinction that fame, riches, and universal admiration could bestow, and distinguished in the triple character of painter, diplomatist, and man, he died at Antwerp on May 30, 1640. For several years he had been a victim of gout, but his death was due to paralysis of the heart. He was buried with elaborate ceremony in the church of St. Jacques in Antwerp.

The pictures ascribed in whole or in part to Rubens reach the enormous number of eighteen hundred, or, estimating the number of years he was actually engaged in the practice of his art, nearly one a week. Among the most noted of them are: "The Descent from the Cross," his masterpiece, and "The Erection of the Cross," both in Antwerp cathedral; "Communion of St. Francis," at Antwerp; "Battle of the Amazons," at Munich; the small "Last Judgment," also at Munich; "Lot and His Daughters Leaving Sodom," in the Louvre, Paris; "Adoration of the Magi," at Antwerp; "St. Theresa Delivering from the Flames of Purgatory Bernardino de Mendoza, the Founder of the Theresian Nuns," at Valladolid; "Crucifixion of St. Peter," at Cologne; "Rape of the Sabines," and "The Judgment of Paris," in the national gallery, London; "Castor and Pollux Carrying off the Daughters of Leucippus," at Munich; six pictures at Vienna illustrating the feats of the consul Decius Mus; "The Garden of Love," at Madrid and also at Dresden; "The Four Philosophers," at Florence; the celebrated *Chapeau de Paille*, in the national gallery, London; "Daniel in the Lions' Den," at Hamilton palace; "The Four Quarters of the Globe," at Vienna; the *Prairie de Lacken*, in Buckingham palace; "Rubens's Country House," in the national gallery, London; and the famous "Rainbow" landscape.

The person of Rubens is described to have been of excellent proportions. His height was about five feet nine and a half inches; his face oval with regular and finely formed features, dark-hazel eyes, a clear and ruddy complexion contrasted by curling hair of an auburn color, with moustache and beard. His carriage was easy and noble, his introduction and manners exceedingly graceful and attractive; his conversation facile and engaging, and, when animated in discourse, his eloquence, delivered with full and clear intonation of voice, was at all times powerful and persuasive. His keen intellect and linguistic attainments qualified him for his successful diplomatic missions, and indicate that he possessed a large, solid, and practical nature as a fitting complement to his artistic temperament.

Of Rubens's personal character we may speak in terms of high praise. He bore his great reputation without pride or presumption; he was amiable in his domestic relations, courteous and affable to all. He was the liberal encourager of merit, especially in his own art, and he repaid those among his contemporaries who aspersed him, by endeavoring to serve them. His own mind was uncontaminated by envy, for which perhaps little credit will be given him, conscious, as he must have been, of his own most extraordinary endowments. His noble admission, however, of Titian's superiority, when he copied one of his works at Madrid, attests the magnanimity of his disposition; and his almost parental kindness to his pupil, Van Dyck, shows that he was equally willing to recognize the claims and to promote the success of living genius. He was simple and temperate in his habits. He rose early and usually attended morning mass at the church. In the evening he often took a ride on horseback.

In extent of range the pencil of Rubens is unrivaled. History, portrait, landscape under the aspect of every season, animal life in every form, are equally familiar to him. His hunting pieces especially, wherein lions, tigers, and other wild animals, with men, dogs, and horses, are depicted under all the circumstances of fierce excitement, momentary action, and complicated fore-shortenings, are wonderful.

In addition to his paintings, Rubens etched a few plates, made some designs for silversmiths, and many for printers like Moretus, for whom he sketched numerous titles, as well as eight illustrations for a history of cameos. He furthermore made designs for several sets of tapestry, of which "The Life of Achilles," "The History of Constantine," and "Triumphs of the Church" are the most important. The amount of his pictorial work was prodigious. Even an incomplete record numbers no fewer than 2,253, exclusive of 484 drawings. The Munich gallery alone contains 77 canvases, and the Louvre, Paris, 54, while there is scarcely a collection of any importance, public or private, which does not include at least one of his works.

Rubens wanted only a purer style in designing the human figure to have been a perfect, as well as a universal, painter. His taste in this is singularly unlike that which the habits of his life seemed likely to produce. He had been brought up in scenes of courtly elegance, and was acquainted with whatever was beautiful in art; yet his conception of character, especially in relation to feminine beauty, betrays a singular want of refinement. He seldom attempted to idealize the human figure. He was content to reproduce literally Flemish types of womanhood. His goddesses, nymphs, and heroines are usually fat, middle-aged, and sometimes even old and ugly; and they always retain the peculiarities of individual models. His men, too, though not without an air of portly grandeur, want mental dignity.

Indeed Ruskin, in his characteristic way, once described Rubens as "a healthy, worthy, kind-hearted, courtly-phrased animal, without any clearly perceptible traces of a soul except when he paints children."

Faults of such magnitude would have ruined the fame of almost any other painter; but while the pictures of Rubens are before us, it is hard to criticise severely their defects. If, as a colorist, he is inferior to Titian, it is perhaps rather in kind than in degree. Titian's coloring may be compared to the splendor of the summer sun; that of Rubens excites the exhilarating sensations of a spring morning. It is true that the artifice of his system is sometimes too apparent, whereas, in Titian, it is wholly concealed. Rubens, however, painted for a darker atmosphere, and adapted the effect of his pictures to the light in which they were likely to be seen. Inferior to Raphael in elegance and purity of composition, he competes with him in fertility and clearness of arrangement. He drew from Paul Veronese a general idea of diffused and splendid effect, but he superadded powers of pathos and expression, to which that artist was a stranger. It is, as Reynolds justly observes, only in his large works that the genius of Rubens is fully developed; in these he appears as the Homer of his art, dazzling and astonishing with poetic conception, with grandeur, and energy, and executive power.

"His character as a painter consisted essentially," says Kugler, "in those qualities which no other master had ever before united in so high a degree, viz., in a truthful and intense feeling for nature, a warm and transparent coloring, a power of picturesque keeping, and a wealth of fire and imagination which embraced every object capable of representation, and enabled him to render with equal success and originality both the most forcible and the most fleeting appearances of nature. It is this combination, in such a degree, of qualities so various, that disposes the connoisseur to tolerate, though not to overlook, the fact that Rubens's heads and figures are seldom of elevated form or refined feeling, but, on the contrary, rude and vulgar in both respects, and continually repeated — nay, even to admit that he is rarely profound or ardent in sentiment, but too often harsh and coarse."

The lofty strain of his composition, his mastery of the mechanics of his art — in which he has never been equaled — the sensuous brilliancy of his color and the embodiment of the pleasures of the senses, strong passion and stirring action, exercised a far-reaching influence on his contemporaries and disciples. His impress was felt in Flemish art for more than a century, and had a moulding influence, as well, on the English school. Of his numerous pupils, Van Dyck was the most famous; but Jordaens, Van Thulden, Diepenbeck, and Quellyn also achieved a fair degree of fame.

1660	Died at Madrid, ...	61

DIEGO RODRIGUEZ DE SILVA VELASQUEZ, the greatest of Spanish painters, was born at Seville, Spain, June 5, 1599, the son of parents of good family of Portuguese origin. His father was Juan Rodriguez de Silva, his mother Geronima Velasquez; so that the painter ought rather to have been known as Silva, but, according to an Andalusian custom, he is commonly known by the name of his mother.

The young Diego was intended by his parents for some liberal profession, was taught Latin, was introduced to *belles lettres*, and even to philosophy. After a time, however, he began to show such unmistakable bent toward art that he was placed as a pupil with Francisco Herrera, the elder, whose brutal manners are said to have driven the boy away, after but a short probation, to the studio of the milder Francisco Pacheco. In his "Art of Painting" Pacheco claims nearly all the glory of his pupil's education during the years 1613–18. His assertions are, however, to be taken with some reserve, for the mature art of Velasquez has vastly more in common with the rough, but painter-like vigor of Herrera, than with the cold timidity of Pacheco. Whether the lad stayed longer with his first master than tradition declares or not, a comparison of their work leaves no room for doubt as to the strong and permanent influence of Herrera's example.

The influence of a third master has been said to count for something. This was Luis Tristan of Toledo, a pupil of El Greco. On him, however, no great stress need be laid. The true masters of Velasquez were his models. He worked directly from nature with a determined sincerity which has not been surpassed. Huge studies of still life, with life-size figures introduced, exist to prove how frankly he endeavored to realize the actual look of things. The models he selected were, for the most part, of the sordid peasant class, and in this way a certain habit of mind was induced, unfavorable to the attainment of that pure and elevated ideal, some infusion of which is all that is wanted to elevate the noble, realistic hardihood of his manner into the very highest region of art. Before he was out of his teens he painted the "Water Carrier," and the "Adoration of the Kings" of the Madrid museum; and in each of these the power given by such studies is conspicuous.

In 1618, when he was not yet nineteen, Velasquez married Pacheco's daughter, Juana. Thirteen months afterward she bore him a daughter, Francisca; and two years later, a second daughter, Ignacia, who seems to have died in infancy. Francisca lived to become the wife of the painter, Mazo-Martinez.

In April, 1622, Velasquez paid his first visit to the Spanish capital, Madrid. There he won the friendship of Don Juan Fonseca, canon of Seville and almoner to the king, who presented him to the minister, Olivares. Of this nothing came for the moment, and the painter returned to Seville. In the first months of 1623, however, he received a letter through Fonseca from Olivares, calling him back and enclosing a sum of fifty ducats to defray expenses.

Velasquez at once set out again for Madrid, taking his father-in-law with him. Within a few days after his arrival he began and finished a portrait of Fonseca, which was carried to the palace and showed to the king. The portrait met with such recognition that it was forthwith declared that he should paint Don Ferdinand, the king's brother, and then, on further consideration, that he should commence with the king himself; and to the magic of Velasquez's brush it is due that Philip's memory has not become as dim, as faint in outline, as that of any other weakling monarch of the long Spanish decadence, which dates from the last years of Philip II. With this same painter the king was to continue, with two important intervals, in daily and intimate intercourse during forty years; and besides the unbounded admiration of the true connoisseur that he undoubtedly was, Philip accorded to the artist as much friendship and regard as it was possible for the king, isolated and walled in by the inflexible court etiquette of the time, to vouchsafe to a subject.

In the autumn of 1623 Philip's portrait was finished, and his delight in it was such that he granted the painter a monopoly in the royal features, and, it is said, ordered previous portraits by the Carducci, Angelo Nardi, and others to be removed from the palace. Thus was Velasquez, at the exceptionally early age of twenty-four years, formally installed as one of the specially privileged painters of Philip IV., with a studio in the palace, a residence in the city, and a monthly stipend of twenty ducats, to which was added, moreover, special payment, as Pacheco states, for each work produced. It was here in 1627 that he completed the "Expulsion of the Moriscos."

In August, 1628, Rubens arrived at Madrid, just about the time that Velasquez was finishing his famous picture, "The Topers." According to Pacheco, the two painters had already been in correspondence, but, however that may be, both natural inclination and the express commands of Olivares led the Spaniard to pay solicitous attention to the Fleming. During nine months the two men lived in close intimacy, and the influence of Rubens, who was now fifty-one years of age, must have had its effect upon his companion. In the work of Velasquez no direct echo from Rubens can be traced, but it was by his new friend's advice that the Spanish painter made his first journey into Italy.

Velasquez obtained leave of absence from the Spanish court, and set out for Italy, sailing from Barcelona on August 10, 1629, in the same ship with Don Ambrosio Spinola, the victor of Breda, and taking his faithful slave, Pareja, with him. Olivares gave him two hundred ducats for his journey, a gold medallion of the king, and many letters of recommendation. The first city in which Velasquez made a stay was Venice. Here he copied Tintoretto's "Crucifixion" and "The Last Supper." From Venice he went to Rome, by way of Ferrara, Bologna, and Loretto. At Rome he remained for a whole year. Through the influence of the count Monterey, at that time Philip's ambassador to the vatican, he was assigned a lodging in the Villa Medici.

After a stay of two months at the latter place, he was driven by fever to take refuge in the Spanish embassy. His time was spent in making studies from the Italian masters, and in completing the "Forge of Vulcan," now in the Prado, Madrid, and the "Joseph's Coat," at the Escorial. Toward the end of 1630 Velasquez went to Naples, where he was the guest of the Spanish viceroy, the duke of Alcalá, and where he formed a close friendship with Spagnoletto. It was at the instigation of Velasquez that Philip IV. bought many of those pictures by the Valencian master, which now hang at Madrid.

Early in 1631 Velasquez was again in the Spanish capital. Delighted to have his favorite back, Philip assigned him for a studio the north gallery of the Alcazar, which communicated with the royal apartments by a door of which Philip kept the key. The king soon fell into the habit of paying a daily visit to the painter, with whose help he himself made some by no means contemptible attempts at painting. Soon after his return Velasquez finished a portrait of Don Balthasar Carlos, at the age of two, and provided a sketch of the equestrian statue of Philip which was afterward modeled by Pietro Tacca at Florence, and now stands before the royal palace at Madrid. In 1634, on the occasion of his daughter Francisca's marriage to Juan Bautista del Mazo-Martinez, Velasquez was permitted to hand down his court appointment to his son-in-law, but was himself continued as an honorary attaché of the court. Between this time and 1648 the story of Velasquez is continued in the chronological list of his pictures.

In the last weeks of 1637 he is said to have painted Marie de Rohan, duchess of Chevreuse, perhaps in the male costume in which she fled from France. In 1638, probably, he painted "The Crucifixion," now in the Madrid gallery. In 1642 he painted the two Aranjuez landscapes, now at Madrid, during the sojourn of the court in that retreat. The following year saw the disgrace of Olivares. He was accompanied into obscurity by the best wishes of Velasquez, who so far disregarded the etiquette of the court to which he belonged as to visit the fallen minister in his exile. The great equestrian portrait of Philip in the Prado was the fruit of 1644. To these years, too, belong the portraits of dwarfs, fools, and other eccentric members of Philip's household, which hang in the same gallery. In 1646 the infante, Don Balthasar Carlos, died, and in 1647 Velasquez painted "The Surrender of Breda," the famous *Las Lanzas*, perhaps the finest purely historic picture in the world.

In January, 1649, Velasquez embarked at Malaga on his second visit to Italy. He was accompanied, as before, by Pareja, and he traveled in the suite of the duke of Najera, who was on his way to receive Philip's *fiancée*, the grand duchess Mariana of Austria. The main object of this second journey was to collect pictures and casts from the antique for the Alcazar and for the proposed academy of fine art, which was only to be established a century later by Ferdinand VI. The painter landed at Genoa, visited successively Milan, Padua, Venice, Bologna, Modena, Parma, Florence, and Rome. From Rome he passed on almost immediately to Naples, where he presented himself to the viceroy, Count d'Onate, who had just suppressed the rising of Masaniello, and renewed his friendship with Ribera.

After this he returned to Rome and stayed there for more than a year. Here he painted the portrait of Innocent X., the reigning pontiff, now considered one of his finest works. In the early months of 1651 the painter still lingered in Italy, but a letter from his friend, Fernando Ruiz de Contreras, hinting at Philip's impatience for his return, led him to make preparations for his journey homeward. He sent his collections off to the care of the Spanish viceroy at Naples, and embarked at Genoa for Barcelona.

Velasquez returned to Madrid in 1651, after which many of his finest works were painted. Such was the favor in which he continued to be held by Philip that the cross of Santiago was conferred on him in 1659, an honor never before awarded except to the highest of the nobility. In 1652 he was appointed palace marshal to the king. This post, the duties of which consisted in attendance on the king in his journeys, and the superintendence of everything essential to his convenience, was one of much honor and emolument. But it involved, at times, great trouble and anxiety; and on the specially important occasion of the conferences held in 1660, to arrange the marriage between Louis XIV. and the infanta, these were such as to utterly prostrate the painter. On June 26th of that year he returned to Madrid, worn down with the overwork to which he had been forced to subject himself. He was then attacked by a subtle fever on July 31st, to which, after much suffering, he succumbed a week later, on August 6th. He was buried with solemn and splendid obsequies in the church of San Juan. He left all he possessed to his wife, but she followed him to the grave on the 13th of the month. After his death the painter's affairs were found, or at least declared, to be in great disorder. The Spanish treasury claimed a large sum from his estate, and laid an embargo upon his effects. Six years later this was taken off on the payment, by his son-in-law, Mazo, of half the amount, the remaining half being remitted as due by the treasury for arrears of pay to Velasquez as king's marshal.

As a man, Velasquez seems to have been all that was attractive and admirable. He is spoken of by Palomino in glowing terms for his courtly refinement, his noble and courteous manner, his kind and generous disposition. He was always ready to befriend other artists; Alonzo Cano and Murillo — rivals, in a sense — owed much to his kindness and advice. His fine spirit toward Murillo, who surpassed him in popularity, and toward the deposed Duke Olivares, to whom he had been indebted while yet an obscure artist, is especially noteworthy. His long career as an intimate of Philip's court had much to do with the character of his dress, which on most occasions was elaborate and elegant. Amid numerous costly diamonds and gems, he also displayed rather prominently the red cross of the order of Santiago, with which the king had honored him.

The chief works which belong to his later period are *Las Hilanderas*, or "The Tapestry Weavers"; *Las Meninas*, or "The Maids of Honor"; the so-called "Portrait of Alonzo Cano," the "Æsop," and "Moenippus," and the later portraits of Philip and his family. *Las Meninas* was painted in 1656, and, near the close of his life, he painted two fine religious canvases: the "Coronation of the Virgin," and the "Anchorites," the latter representing St. Anthony and Paul the Hermit, in a desolate landscape of sublime grandeur.

The universal fame of Velasquez as a painter really dates from the first quarter of the nineteenth century. Until then his pictures had been immured in the palaces and museum of Madrid. In one respect, at least, this was fortunate for Spain: from want of popular appreciation they had, to a large extent, escaped the rapacity of the French marshals during the Peninsula war. In 1828 Sir David Wilkie, the noted Scotch painter, wrote from Madrid that he felt himself in the presence of a new power in art as he looked at the works of Velasquez, and at the same time found a wonderful affinity between this master and the English school of portrait painters, being specially reminded of the firm square touch of Raeburn. He was struck by the sense of modernness of impression, of direct contact with nature, and of vital force which pervaded all the works of Velasquez, in landscape as well as in portraiture.

Time and criticism have now fully established his reputation as one of the most consummate of painters, and he more thoroughly foreshadowed the art of our own time than did any other "old master." Ruskin says of him that "everything Velasquez does may be taken as absolutely right by the student." His marvelous technique and strong individuality have given him a power such as is probably exercised by no other single individual. Acquainted with all the Italian schools, the friend of the foremost painters of his day, he was strong enough to withstand every external influence, and to work out for himself the development of his own nature and his own principles of art.

A realist of the realists, he painted only what he saw; consequently, his imagination seems limited. His religious conceptions are of the earth earthy, although some of his works, such as "The Crucifixion," and "The Scourging," are characterized by an intensity of pathos in which he ranks second to no painter.

"His portraits," says the talented art critic, Richard Ford, "baffle description and praise. They must be seen. He elevated that humble branch to the dignity of history. He drew the minds of men — they live, breathe, and seem ready to walk out of the frames. His power of painting circumambient air, his knowledge of lineal and aerial perspective, the gradation of tone in light, shadow, and color, give an absolute concavity to his canvas; we look into space, into a room, into the reflection of a mirror. It is even difficult to doubt the anecdote related of Philip IV., who, mistaking for the man the portrait of Admiral Pareja in a dark corner of Velasquez's room, exclaimed (he had been ordered to sea) — 'What! still here?'"

England was the first nation to recognize his extraordinary merit, and owns by far the largest share of his works outside of Spain. But Velasquez can only be seen in all his power in the gallery of the Prado at Madrid, where over sixty of his works are preserved, including historical, mythological, and religious subjects, as well as landscapes and portraits.

Although acknowledged even by his contemporaries to be the first among Spanish painters, Velasquez had, nevertheless, but few immediate followers. His son-in-law, Juan Bautista del Mazo-Martinez, his slave and afterward freedman, Juan de Pareja, and his successor in court favor, Carreno de Miranda, are all that achieved distinction. His true followers came much later. The painters of to-day and yesterday — the modern French painters and their fellow artists in Europe and America — these are the real followers of the great Spanish master.

Paul Lefort, in his excellent estimate of Velasquez, says: "Velasquez may be regarded as a precursor, an initiator of the modern school of painting. In his manner of interpreting life, in his just observation of the laws of light, in his habitually clear and simple method of representation, as well as in his technique — so novel and so original even nowadays — Velasquez marks such an advance upon the art of his time that he seems rather to belong to our own. The striking relief and perfect solidity with which he endows natural objects, the marvelous envelopment of air with which he surrounds them, gives such a peculiar intensity of illusion and appearance of life to his work, that, comparing it with the productions of even our boldest realists, we are tempted to exclaim that this painter of Philip IV. speaks not only the language of the painter of to-day, but that of the painter of the future — a language so completely formulated, so definite, and so perfected by this master of two centuries ago that we may say, and without injustice, that even our impressionists — the advance guard of the modern school — have as yet scarce learned to lisp it."

REMBRANDT HARMENSZOON VAN RIJN, or REMBRANDT, son of Harmen of the Rhine, the most celebrated of Dutch painters, was born at Leyden, near Amsterdam, Holland, July 15, 1607. He was the sixth son of a well-to-do miller of Leyden, Harmen Gerritsz, and Neeltje (Cornelia), daughter of Willems of the village of Zuydbrock.

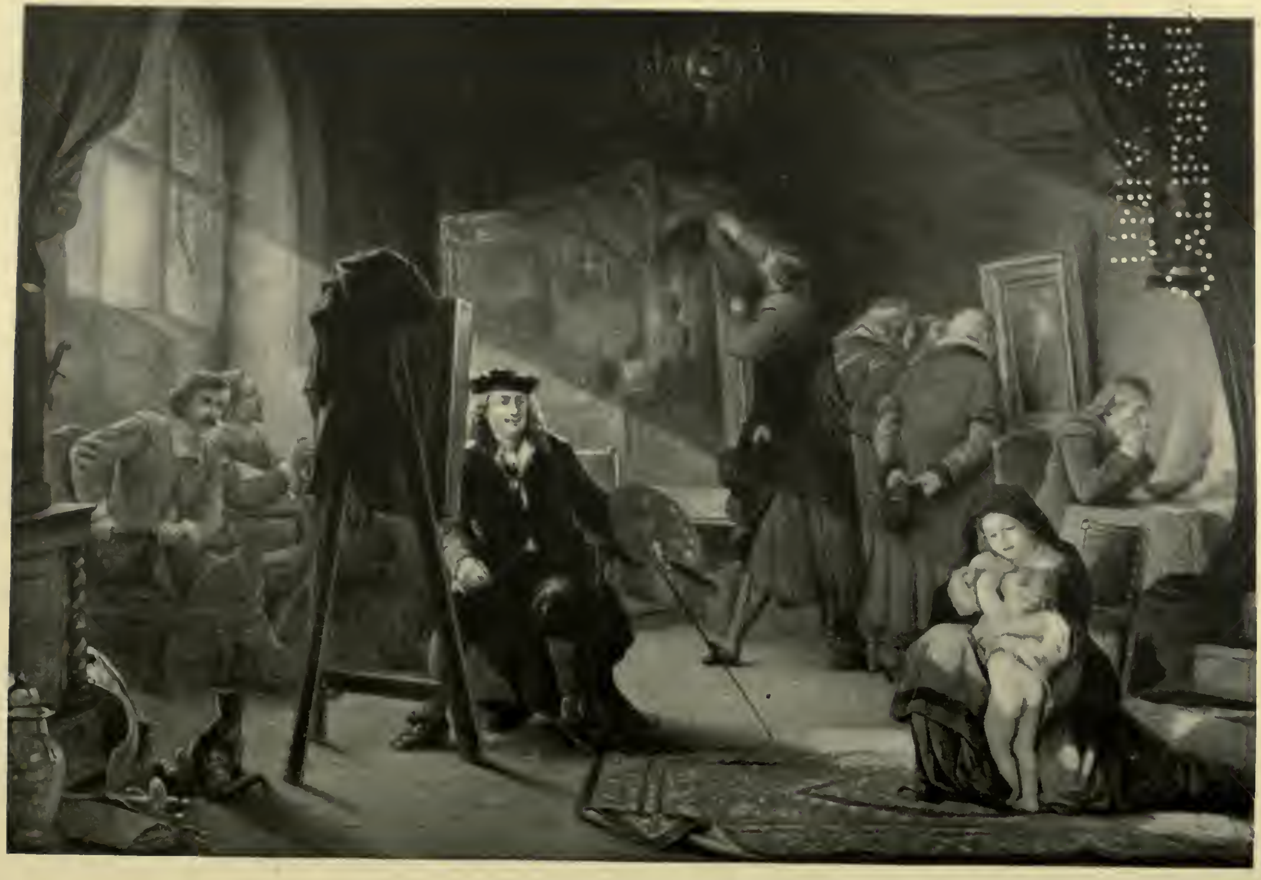
At the early age of twelve, Rembrandt, who showed decided proclivities toward art, was placed under Van Swanenburch, a painter of modern talent in Leyden, and he also attended the university of Leyden. His parents entered him at the university in the expectation that he would eventually take up the profession of law; but his almost complete absorption in the study of painting led him to devote himself exclusively to that art.

From Leyden he went to study for a year at Amsterdam under Pieter Lastman, whom he left in order to frequent the studio of Jacob Pinas at Haarlem. After having learned all that others could teach him, Rembrandt returned to his father's house, and during several years devoted himself to that solitary study from which genius derives its power and originality. He remained seven years in his native town — from 1623 to 1630 — and carried out those elaborately staged compositions which mark his first period as a painter, and he took his first steps as an etcher. His etching, "The Presentation with the Angel," and several fine portrait studies belong to this early period.

At the age of twenty-three Rembrandt established himself at Amsterdam, and began his remarkable independent career, never leaving that city until his death thirty-nine years later.

M. Michel in his life of Rembrandt paints a graphic picture of Amsterdam in 1630, of her growing trade and prosperity, and of the transformation, not only in the city itself, but in the spirit of the inhabitants, which followed the long struggle with Spain. The revival of civil life had been followed by a great increase in the attention given to the arts. The institutions fostered by the war had encouraged painters, and now, with returning prosperity, other institutions, and especially those connected with charity, came forward as patrons of pictures. For a long time Amsterdam was the chief place to profit by the return of peace. Her position, at once well sheltered and easily accessible both from the interior and the sea, has often been likened to that of Venice, but perhaps a comparison would be better with Constantinople. Her position at the head of the then navigable Zuyder Zee, and at a point where all the canals of Holland converged from the south, was very similar to that of the eastern capital on the sea of Marmora. Within a century of William the Silent's assassination in the palace at Delft, Amsterdam had practically grown into the town we all knew until the other day. Like several other Dutch cities, she has now begun to put on suburbs at an alarming rate, but in 1630 she was already at the knees of that rampart over which she only began to swarm some twenty years ago.

During his first year in Amsterdam, Rembrandt painted the "Portrait of an Old Man," now in the Cassel gallery, and thereafter followed portraits, landscapes, historical, and genre subjects, in great numbers, as well as the hundreds of wondrous etchings, which have served almost as much as his paintings to immortalize him. There are two pictures dated by him 1631, both of which, a "Portrait of a Young Man" and "Saint Simeon in the Temple," are now in the museum at The Hague. In the following year Rembrandt painted for the anatomical theater of the college of surgeons at Amsterdam "The Anatomist Nicholas Tulp and his Pupils," a famous picture — now in the museum at The Hague — which alone would suffice to place



UNIV. OF CALIFORNIA

REMBRANDT IN HIS STUDIO

From the painting by L. P. Roux

the author in the first rank of the Dutch masters. In the picture Professor Tulp is seen standing behind an operating table upon which is placed the corpse. Forceps in hand, he lifts the tendons of the partly dissected arm, while around him press his colleagues, eager to watch and to listen. It is a marvelous picture for a young man of twenty-five, and is generally accepted as a milestone in the career of the painter, and as marking a new departure.

"It is Rembrandt's triumph," says Frederick Wedmore, "that over all this terrible reality of the dead, the reality of the living is victorious; and our final impression of his picture is not of the stunted corpse, but of the activity of vigor and intellect in the lecturing surgeon and passing crowd."

Malcolm Bell has written: "The enthusiasm aroused by 'The Anatomy Lesson,' when it was finished and hung in its predestined place in the little dissecting room of the guild of surgeons, was immediate and immense. Commissions flowed in upon the artist faster than he could execute them, so that those who wished to be immortalized by him had often to wait their turn for months together, while all the wealth and fashionable of the city flocked to the far-off studio in the outskirts, the more fortunate to give their sittings, the later comers to put down their names in anticipation of the future leisure. From the beginning, too, pupils came clamoring to his doors, eager to pay down their hundred florins a year, as Sandrart says they did, and work with and for the lion of the day."

In 1633 Rembrandt finished "The Shipbuilder and his Wife." The next year, 1634, marks his marriage to Saskia, daughter of Rombertus van Uylenburgh, pensioner and burgomaster of Leeuwarden in Frisia. He received a considerable fortune with his wife, and lived with her happily until her death. The eight years following his marriage were the happiest period of the artist's life. He received numerous commissions for pictures, and his etchings were also a source of great profit to him. He purchased his house, and formed a fine and valuable collection of Italian pictures, engravings, marbles, armor, and works of art. Saskia formed one of Rembrandt's best models, and during her short married life sat for eighteen separate portraits, of one kind or another, besides other compositions. She died in 1642, leaving a son named Titus. Rembrandt married again about 1653, but nothing is known respecting this second marriage, except that it resulted in the birth of two children, one of whom, Cornelia, survived her father.

The year of Saskia's death produced the famous "Sortie of the Civic Guard," usually known as "The Night Watch," a guild picture representing Captain Banning Cocq and his company of musketeers. The incident represented is a call to arms of the civic guard. The company is issuing from its guild house; the captain, dressed in black and wearing a red scarf, gives his orders to the lieutenant, who, clad in yellow, with a white scarf about his waist, and wearing a yellow hat adorned with a white feather, walks at his side — the two men preceding the rest of the group.

The canvas measures eleven by fourteen feet, but, as originally painted in 1642, was considerably larger. The mutilation which it has undergone took place in 1715, when the picture was removed from the hall of the Musketeers' Doelen to the town hall of Amsterdam; and, in order to suit it to the dimensions of the place assigned to it, part of the drum to the left, and two figures to the right of the canvas were cut off. A contemporary copy of the work by Gerrit Lundens, now in the national gallery, London, shows this to have been the case.

Erroneously called "The Night Watch" — a name given it by French writers at the end of the eighteenth century — it is not a night scene, as its darkened condition, caused by time, thick coatings of varnish, and fumes from peat-fires and tobacco smoke seemed to indicate, but, on the contrary, as a recent cleaning and restoration has proved, was painted in full sunlight. It has even been asserted that the exact position of the sun can be ascertained from the shadow cast by Banning Cocq's hand on the tunic of his lieutenant.

The decade after his wife's death brought disastrous changes in the financial fortunes of Rembrandt, though in it he produced some of his best work. "Christ at Emmaus" was painted in 1648. Holland during this period suffered from a severe industrial stringency, and a consequent change in public expenditures for the refinements of art. In addition to this, the documents preserved in the court of insolvency at Amsterdam show that in 1656 Rembrandt was under the necessity of abandoning to his son, Titus, all the real property in which he had a life interest under the will of his first wife. Shortly afterward he was forced to intrust to a court of law the administration of his own property, which was sold by public auction. Fortunately for his memory, the inventory of his personal effects has been preserved. It proves that this man, who had been made a type of sordid avarice, devoted nearly the whole of his wealth to the purchase of pictures and engravings by the Italian masters, antique marbles, rare and precious articles of furniture, and objects of art of all kinds. The passion for beautiful works of art and curiosities, and the mal-administration of a fortune, estimated at the time of his first wife's death at upward of forty thousand florins, had been the sole means of reducing Rembrandt to the sad position in which we now see him placed. After abandoning to his creditors absolutely everything he possessed, he withdrew into a laborious isolation, and after ten years of patient toil the old artist at last succeeded in satisfying their claims.

However, during this time of stress and vexation, Rembrandt produced probably his greatest work, "The Syndics of the Merchant Drapers," completed in 1661. In this great picture five members of the cloth guild are ranged round the inevitable table, prosaically occupied in the verification of their accounts. They are all dressed in black costumes, with flat white collars, and broad-brimmed black hats. Behind them and somewhat in the shadow, as befits his office, a servant, also in black, awaits their orders with uncovered head. The tablecloth is of a rich scarlet; a wainscot of yellowish-brown wood with simple mouldings forms the background for the heads. No accessories, no variation in the costumes; an equally diffused light falling from the left on the faces, which are those of men of mature years, some verging on old age. With such modest materials Rembrandt produced his masterpiece.

Never before had Rembrandt achieved such perfection; never again was he to repeat the triumph of that supreme moment when all his natural gifts joined forces with the vast experiences of a life devoted to his art in such a crowning manifestation of his genius. Brilliant and poetical, his masterpiece was at the same time absolutely correct and unexceptional. Criticism, which still wrangles over "The Night Watch," is unanimous in admiration of the "Syndics." In it the colorist and the draughtsman, the simple and the subtle, the realist and the idealist alike recognize one of the masterpieces of painting.

Rembrandt's son, Titus, died in 1668, and the distinguished painter in his melancholy last years was left with two children — his daughter, Cornelia, and a granddaughter — to form his only links with the past. His own death took place about thirteen months later. The only allusion to it that has been found is the record on the death register of Westerkerk, Amsterdam, in which this entry occurs: "Tuesday, October 8, 1669; Rembrandt van Rijn, painter, on the Roozegraft, opposite the Doolhof. Leaves two children."

Rembrandt painted more than forty portraits of himself, in many aspects and various fantastical costumes. Although probably few of them are accurate likenesses, it is clear that he was a strong man, of ordinary figure, with a thick nose, firm mouth framed with a stiff moustache, and imperial and dark piercing eyes. He possessed a rather somber, thoughtful, dreamy disposition, which he communicated to his works, though many are also full of pathos, mystery, sympathy, and fine imagination. Some of his censorious critics charge him with dissipation, extravagance, and even avarice; but these stories have been proven to be entirely unfounded.

Among his chief paintings, including those already mentioned, are "The Syndics," at Amsterdam; "The Shipbuilder and his Wife," in the collection of the British royal family; the "Jewish Rabbi," in the national gallery, London; and "The Night Watch," at Amsterdam. Of his historical pictures, the most remarkable are: "Duke Adolphus of Gueldres Threatening his Father," and "Moses Destroying the Tables of the Law," in the Berlin museum; the "Sacrifice of Abraham," in the Hermitage at St. Petersburg; the "Woman Taken in Adultery," in the national gallery, London; the "Descent from the Cross," and the "Nativity," in the same collection; "Christ in the Garden with Mary Magdalen," and the "Adoration of the Magi," in the collection of the British royal family; and "Tobit Adoring the Departing Angel," in the Louvre, Paris. Of his landscapes, of which he painted fewer than of other kinds of pictures, a very characteristic specimen is that known as "The Mill," in the possession of the marquis of Lansdowne. His most noted etchings include a "Descent from the Cross"; "Christ Healing the Sick"; "The Raising of Lazarus"; "Burgomaster Jan

Six"; and the well-known "Landscape with Three Trees."

Rembrandt is one of the most perfect colorists that ever existed; and in chiaroscuro — the contrasts of light and shade — he has no equal in the whole range of art. He has clearly shown in all his works that the grand resources of his art consist in subduing gaudy and harsh colors, because they ought not to be used except for bringing out the principal objects. Rembrandt used them with address, either by glazing them over in the manner of the Venetian school, or by blending other tints to lessen that harshness which dazzles the eyes. He perceived that by the circulation of air which surrounds all objects, colors receive a reflection from whatever is near them; and, consequently, all representations of nature ought to participate in those aerial gradations which in his pictures appear to raise the figures from the canvas as if they were animated. As examples of composition, expression, color, and light and shade, his works rank with those of the greatest artists. In order to thoroughly know and appreciate Rembrandt, it is not sufficient to admire his paintings; it is also necessary to examine and study the wonderful engravings, upward of three hundred sixty in number, which he executed between 1628 and 1661, and which amateurs search for with an enthusiasm which every year grows more ardent. As an etcher he has neither equals nor rivals.

Mentally he was a man keen to observe, assimilate, and synthesize. His conception was localized with his own people and time — he never built up the imaginary or followed Italy — and yet into types taken from the streets and shops of Amsterdam he infused the very largest humanity through his inherent sympathy with man. Dramatic, even tragic he was at times, and yet showed it less in vehement action than in passionate expression. He had a way of striking universal truths through the human face, a turned head, bent body, or outstretched hand that was powerful in the extreme. His people have great dignity and character; and we are made to feel that they are types of the Dutch race — people of substantial physique, slow in thought and impulse, yet capable of feeling, comprehending, enjoying, suffering. His landscapes, again, are a synthesis of all Dutch landscape, a grouping of the great truths of light, space, and air. Whatever he turned his mind upon was treated with that breadth of view that overlooks the little and grasps the great.

Emile Michel says: "His originality of interpretation was always controlled by study of nature. Nature made him what he was, and to her he turned unceasingly. One of his principles was that 'Nature alone should be followed.' Tradition had little power over him, and yet he never deliberately threw off its yoke. On the contrary he was always keen to know what men had done before his time, and to profit by their teaching. But when a subject had to be treated he did not trouble himself too much about what others had said. He thought about it for himself; he entered into it; he, as it were, lived it over again, and then set himself to reproduce it in his own way, giving special force to those aspects which had stirred his own emotions.

"Rembrandt belongs to the breed of artists which can have no posterity. His place is with the Michaelangelos, the Shakespeares, the Beethovens. An artistic Prometheus, he stole the celestial fire, and with it put life into what was inert, and expressed the immaterial and evasive sides of nature in his breathing forms."

JOHANN SEBASTIAN BACH, founder of modern music, and one of the supremely great musicians of the world, was born at Eisenach, in Saxe-Weimar-Eisenach, Germany, March 21, 1685. The family to which he belongs had already produced many musicians.

His father, Johann Ambrosius, was a court and city musician at Eisenach. His mother was Elizabeth Lämmerhirt, daughter of a furrier of Erfurt. The former was one of twin brothers, who were so much alike in person and voice that their wives could know one from the other only by their dress. Their temper, their constitution, their talent, and their music were alike; and their death took place very nearly at the same time. This occurred when Sebastian was but ten years old. His elder brother, then organist in the little town of Ohrdruf, took him under his protection, and taught him the principles of the art for which his family was famous.

It is to be supposed, however, that in the household of his father he made the early familiarity with music, without which even his marvelous organization could not have been developed. His own ardent love of his pursuit, and his brother's want of sympathy with him are equally shown in an early incident. He had a great desire to study some of the compositions of the most profound writers of the day, but was forbidden the use of a volume which contained them. He procured the book, however, by stealth, and copied the valued pieces in secret on moonlight nights, and thus spent six months upon the task. He had scarcely finished his labor, when his brother discovered the transcript and confiscated it. He did not regain it until, shortly afterward, the death of Christoph left the boy again without a protector.

In this destitute condition he went with a schoolfellow to Lüneburg in 1700, and obtained there an engagement as a singer in the choir of St. Michael's school. Here he began, too, the study of the organ under George Boehm, an organist and composer of distinction, and laid the foundation for his career as the greatest master of composition for this instrument, and one of its greatest players. With enthusiasm that no difficulties could check, he walked several times to Hamburg to hear the performances of Reinken, the famous organist. He also went to Zell to hear the concerts of the prince's band, and lost no opportunity that could afford him gratification from, or improvement in, his beloved art. When he was eighteen, he was engaged to play the violin in the orchestra of the duke of Weimar, and it was probably then that he became acquainted with the concertos of Vivaldi, to which he always attributed his ideas of the principles of musical construction, which he subsequently developed to such completeness as to make his works a model of form for all time.

Especially devoted to the organ as an instrument, and anxious for the field in which to exercise his wonderful powers of invention, Bach quitted the duke's service in 1704 to accept the office of organist at Arnstadt, in which for the first time he had an opportunity to prove his remarkable ability. While in this situation he made several art-pilgrimages for the sake of hearing any player from whose experience he might derive any improvement. In particular, he once walked to Lübeck, where the celebrated Buxtehude was organist of St. Mary's church, with whose playing and composition he was so delighted that he prolonged his stay for three months. In 1707 he was appointed organist of the church of St. Blasius at Mühlhausen, where, in the same year, he married his first wife, Maria Barbara, daughter of Johann Michael Bach of Gehren. The year following he returned to Weimar, no more in the subordinate capacity of an orchestra player, but in the important capacity of court organist.

His environments at Weimar were such as to quicken Bach's already active musical faculties. The life of the court was decorous; the duke — William Ernest — was a man of serious temperament, a patron of arts and letters, and used his utmost endeavors to bring the music of the ducal chapel up to a high standard. It was he, in fact, who laid the foundation of that culture which made Weimar the center of German letters in Goethe's time, and gave it a "golden period" of music when Liszt resided there. The nine years spent at the ducal court did much to perfect Bach's style as a composer for the organ, and some of the best of his cantatas were also written there.

His reputation as a performer, as a composer, and as an extemporist, began now to spread over all Germany, and his unremitting study gave even further justification to the high esteem in which he was held. In 1717 Prince Leopold of Anhalt-Köthen, a great patron of music, and himself a talented singer and player, offered him the office of master of his chapel and director of his concert, which gave him still greater opportunity than he had yet enjoyed. Here he composed numerous works for the clavichord and orchestra, and this period of his career is, therefore, marked off in a general way from his more serious period at Weimar, and the final epoch at Leipzig.

On the death of Zachau, the master of Handel, however, Bach was invited to succeed him as organist at Halle, and went there to prove his fitness for the appointment; but, for some unknown reason, the post was given to Kirchhoff, a pupil of the former organist.

About this time Marchand, a French player, was exciting great admiration in the court of Dresden; and it was proposed that Bach should make a trial of skill with him, to prove the superiority of French or German art. Accordingly, Bach went to Dresden, and, having heard his rival, and so satisfied himself that he was worthy to compete with him, sent him a most courteous challenge, which Marchand accepted. On the appointed day Bach appeared before the elector and his retinue; but Marchand, after he had been long waited for, was ascertained to have suddenly left the city, and thus left the field to his opponent. Bach, on this occasion, gave such a superior performance that his incomparable ability was fully demonstrated.

In 1720 Bach's wife died, and in December of the next year he married his second wife, Anna Magdalena Wülkens, the beautiful daughter of the court trumpeter at Weissenfels. A woman of decided musical gifts herself, she proved a most sympathetic and industrious helper of her artist-husband. She copied much of his music, and many of his works for keyed instruments were written for her use. By his two marriages, Bach had twenty children, eleven sons and nine daughters — seven during his first marriage, and thirteen during his second — many of whom inherited rare musical endowments, and two of whom achieved high fame.

In 1722 he revisited Hamburg for the purpose of again hearing the veteran Reinken, then nearly a hundred years old. It was not as a mere listener that he now met the master. On this occasion, to prove himself a worthy successor to the old man's reputation, he played at great length and with such fine effect that Reinken exclaimed: "I thought this art would die with me; but here I find it has a more able representative." In this year Bach's first publication appeared. Although from a very early period he had with ceaseless assiduity studied and practiced composition, and thus developed a style entirely his own, it was not until his thirty-eighth year that one of his works was printed. It was his habit so carefully to perfect what he wrote by correction and recorrection that he was even then reluctant to let his work pass through the press, because publication, as he viewed it, would be an obstacle to further improvement. Even this first publication, the first part of *Das Wohltemperirte Clavier*, known in English as the "Forty-eight Preludes and Fugues"— the latter half of which was written some years later — was reprinted three times during his life, and underwent very important modifications in each successive edition.

Bach liked especially to play upon the clavichord, which was a portable instrument of small power, and, unlike the harpsichord, yielded more or less tone according to the force used by the player; and it was upon this instrument that he most frequently composed. He disregarded the custom which had prevailed until his day, of writing in a few keys only, and tuning keyed instruments so as to render these nearly perfect at the expense of the rest. He, therefore, tuned this instrument with equal temperament, a task he never would trust to another, and which he accomplished with singular rapidity. It is also to be remarked that he was the first who used the thumb and the fourth finger in fingering on the pianoforte key-board. His preludes and fugues, in each of the twelve major and twelve minor keys, exemplify both his method of tuning and his system of fingering.

In 1723 Bach received the most important appointment in his career, that of cantor, or choirmaster of St. Thomas's school in Leipzig. This appointment obliged him to resign his engagement with Prince Leopold, who, however, remained his warm friend until he died, when Bach wrote a funeral cantata for his obsequies. In his new situation the master, now generally acknowledged as such, had a larger field of action than he had yet enjoyed. His playing became more and more famous, and he had constant opportunity for the production of important works. His income, also, was soon increased by his additional appointment as composer to the duke of Weissenfels. He had many pupils in composition and on instruments. He was frequently engaged to examine new organs and to elect organists, and he now published numerous works.

Many as were these sources of income, the expenses of his numerous family, and his hospitality to the artists from all countries who visited him, necessitated frugality in his household. Though he might have gained riches and honors wherever he went, had he traveled as a player, he preferred the simple life with its simple means, which enabled him to labor uninterruptedly in his art, and to win the personal regard of all who had occasion to meet him.

He now wrote the greater part of his enormous number of church compositions, including most of his motets and church cantatas, and his services for every Sunday and festival day for five years, for the use of his choir. Though he never wrote what we would now call light music, he was not without relish for the composition of others of a less severe character than his own, and, accordingly, used to make frequent pleasure trips to Dresden with his eldest son for the sake of hearing the operas of Hasse, then constantly given there. In 1736 he received the further appointment of chapel master to the court of Dresden, under Augustus III., king of Poland, and elector of Saxony, who had, like his father, abjured the Lutheran faith in favor of that of the church of Rome. This office gave Bach occasion to write his masses and other pieces for the Roman Catholic service.

He had now attained the summit of his greatness. His simple and homely nature found its chief pleasure in his family circle, in witnessing the successes of his elder sons, whom he had taught to emulate himself, and in training his younger children to follow in their course. He had some quarrels with the master of his school, which were not, however, of a nature to disturb his comfort; at least, they did not interrupt his artistic pursuits. He was unaffectedly pious, without any of the polemical scruples that induced his ancestor to leave Hungary, and he wrote indifferently for the Lutheran church and for that of Rome. He never sought applause. His self-satisfaction was the goal of his endeavor. He disregarded the honor that everywhere awaited him; and thus he lived, composing, playing, and teaching; advancing his art in all.

Bach always had a great wish to know Handel — the only one of his contemporaries whom posterity ranks with him — and, in 1719, while residing at Köthen, on hearing that the famous Saxon was visiting his native town of Halle, he went there in the hope of meeting him, but he found that Handel had departed on that very day. While Bach was at Leipzig, Handel again visited Halle, when Bach, being prevented by illness from leaving home, sent his eldest son to invite him to come to his house. This invitation was equally in vain.

Frederick the Great, of Prussia, whose love of music is almost as renowned as his success in battle, it is said, often inquired of Bach from the latter's second son, Emmanuel, who had an engagement at Frederick's court. In consequence, Bach was persuaded in 1747 to visit Potsdam, where the Prussian monarch was staying. The king was surrounded by his musicians on the usual evening for the concert, and Frederick, with his flute in hand, was ready to play the solo which was to be the first piece. According to custom, an officer then presented to him the list of the arrivals in the town, on which Frederick saw the name of the master. "Gentlemen," cried the king, "old Bach is come," and so broke up the meeting; the presence of the great musician engrossed all his attention.

A messenger summoned Bach to the palace without allowing him time to change his traveling dress, and the king received him with the most eager welcome. In the palace there were several pianofortes — then a newly invented instrument — made by Silbermann, and Bach must play upon them all. The king was delighted with his guest, and wrote him a subject for a fugue on which the master extemporized, to the amazement of the many musicians and courtiers who gathered to hear him. Bach afterward wrote a very elaborate work upon this theme which he dedicated to his royal admirer. The following day he went to Berlin to try the principal organs in that city, and to see the opera house and concert room, where he astonished those who accompanied him by the rare knowledge of acoustics which he displayed in his examination of these buildings. He returned to Leipzig to quit it no more.

Bach's labors at Leipzig were unremitted almost up to the time of his death. He finished his "Art of Fugue," and then set to work on a much more extensive study, when an affliction of his eyesight suddenly stopped all further progress. His sight had been injured at a very early age, probably by the moonlight transcription of his brother's forbidden volume, and it now failed him so greatly that he was persuaded to let an English oculist operate upon him. The experiment was unsuccessful, and a second attempt reduced the sufferer to total blindness. Ten days before his death his sight suddenly returned, but after a few hours he became delirious; and a stroke of apoplexy closed his life on July 28, 1750. When he found his final blindness returning, he called his son-in-law to him, and, as a sort of valedictory, dictated music for the choral, "When We are in the Depths of Need." A little later, when death had already laid its hand upon him, he asked that the inscription be changed to "Herewith I Come Before Thy Throne."

It is a singularly harsh commentary on the times, that the death of the great founder of modern music called forth practically no public notice. He was unostentatiously buried in St. John's churchyard in Leipzig, and, when that was converted into a street, his dust was exhumed and found no definite resting place.

His labor was indeed prodigious; very few of his works were published during his lifetime; but he left an immense collection of manuscripts, scattered about in various libraries. He wrote over two hundred fifty cantatas, seven masses, one hundred forty-nine psalms, and one hundred fifty chorals. His works for the harpsichord, with and without accompaniment, are too numerous to mention, and his instrumental works comprised seventeen numbers, consisting of overtures, symphonies, concertos, and other compositions.

Bach was perhaps the most severely conscientious artist that ever devoted himself to music. He deemed that to compromise his art would be to compromise himself, and that to lend himself to anything which did not to the utmost of his power tend to exalt it was in the last degree unworthy of him and of music. He was the greatest master of counterpoint in the history of music, and is especially remarkable for the strict integrity of his part-writing, the complexity of which, we must own, often prevents the broad and massive effect that greatly distinguishes the music of Handel. His wonderful power of expression evinced in his free movements and in his great choral works, particularly in his famous *Passions-Musik*, is the manifestation of a transcendent genius.

As he despised popular applause, so his music is little open to popular appreciation; his music is beyond that of any other composer, difficult of comprehension, but its measureless beauties will ever repay the pains of the student who unravels them.

As a composer, Bach discovered many novelties which have been wrongly claimed for his successors. Gluck is called the father of recitative, but no finer examples are to be found than those written by Bach for many of his cantatas, and especially for the *Passions-Musik*. Mozart and even Beethoven have been credited with the invention of musical effects to be found in Bach's works. No musician has excelled him in the art of combining a great number of voices and instruments together — an art he created himself, for he had few opportunities of hearing orchestral effects on a large scale.

His melody is sometimes fantastic, but it is never commonplace; he seemed to take a pleasure in choosing rough, uncompromising materials for his themes, which at first excite more astonishment than delight, and then proceeds to charm his auditors by skillfully drawing unexpected and pleasing effects from these unlikely sources. His harmony is very effective; it is characterized by boldness rather than by strict adherence to the rigid laws of counterpoint.

The musical idea conveyed by his choruses is aptly compared to that of a people kneeling in respectful adoration before a celestial being, or the cry of triumph of men glorifying God in the incomparable beauty of His creations. Nowhere in the domain of art is the grandeur of religion more worthily celebrated than in the sacred compositions of Johann Sebastian Bach. All succeeding composers have bowed with reverence before his name, and acknowledged in him the creative mind which not only placed music on a deep scientific basis, but perfected the form from which have been developed the wonderfully rich and varied phases of orchestral composition. Handel, who was his contemporary, having been born the same year, spoke of him with sincere admiration and called him the giant of music. Haydn wrote, "Whoever understands me knows that I owe much to Sebastian Bach, that I have studied him thoroughly and well, and that I acknowledge him only as my model." Mozart's unceasing research brought to light many of his unpublished manuscripts, and helped Germany to a full appreciation of this great master. In like manner have the other luminaries of music placed on record their sense of obligation to one whose name is obscure to the general public in comparison with many of his brother composers.

To his extraordinary musical genius, Bach united social qualities that endeared him to his family and friends. He was a good father, a good husband, and a good friend. Every lover of music, no matter whence he came, was received by him with open arms, for, though not rich, his hospitality was unbounded. Notwithstanding his undoubted superiority as performer and composer over his contemporaries, he was exceedingly modest in his intercourse with them. When asked how he had attained such high proficiency in his art, he said it was by continual application, and those who chose to work in the same manner could be as successful as himself. He seemed to count as nothing the extraordinary genius with which nature had endowed him.

GEORGE FREDERICK HANDEL, an eminent German composer, and chief founder of oratorio, was born at Halle, Prussian Saxony, February 23, 1685, though for almost half a century he resided in England, his adopted country.

He was the son of a surgeon, who died when his son was but twelve years of age, and from whom Handel at first received but little encouragement in the developments of his early disclosed musical talent. The father intended that his son should follow the law as a profession; but the latter managed to practice secretly on a small clavichord, or spinet, placed in the attic, and otherwise showed his extraordinary passion for music.

In his eighth year he attracted attention by his playing on the occasion of a visit by his father and himself to the duke of Saxe-Weissenfels, and the duke was so impressed with his genius that he counseled its unrestrained cultivation. His father was thereby persuaded to renounce his opposition, and about 1693 the boy was placed under the instruction of Zachau, a famous organist, who was deemed worthy to guide the steps of so promising a pupil. He remained under Zachau for three years, composed every week cantatas for the church service, learned all the orchestral instruments, especially the organ, and familiarized himself with the works of the most celebrated composers of Germany at that time.

His education was furthered at the university of Halle, which he entered in 1702, and he also became organist of the Domkirche in the same city. At this time he excelled on the organ, clavichord, and violin, and shortly thereafter he took a position in the orchestra of the Hamburg opera house where he astonished the public with his skill. Here Handel formed a friendship with the musician, Mattheson, and, when he produced his first opera, *Almira*, in 1705, Mattheson assumed the chief character. This opera was speedily followed by *Nero*, *Florindo*, and *Daphne*, and he was made director of the orchestra. Subsequently, his violent temper involved him in a quarrel with Mattheson, which resulted in a duel, and almost in his death; by a mere accident the sword of his adversary was stopped by a large metal button on his coat. At Hamburg, also, he composed a number of works for the church, and gave lessons to many pupils.

In 1707 and 1708 Handel visited Italy. During the first year he produced his *Rodrigo* at Florence, and the following year his *Agrippina* at Venice. The latter had a run of thirty nights and was received with

extraordinary favor. His journey through Italy — which included Rome and Naples — was one of continued triumphal progress. He met, in Italy, Scarlatti, who greatly influenced his subsequent works, and at Rome he formed an intimate friendship with Cardinal Ottoboni. It is also related that he heard and met Corelli, the famous Italian composer and performer, whom he beat with his own violin for not playing to suit him in his opera of *Il Trionfo del Tempo.*

On his return to Germany in 1709, Handel was offered and accepted the position of chapel master at the court of the elector of Hanover — afterward George I. of England — with a good salary and permission to visit England, a voyage Handel was very anxious to make. He arrived in London in 1710, and almost immediately received the patronage of Queen Anne and the nobility in general. In the year 1711 he composed an opera, *Rinaldo,* which was performed at the Haymarket with great success. Compelled by his engagement to return to Hanover, he quitted England only to return in 1712, when he permanently settled in London. His patron, the elector of Hanover, ascended the throne of England as George I. in 1714, and Handel, whose prolonged visit to London had offended him, succeeded in again finding grace in his eyes by writing a symphony, followed by several instrumental pieces, for a fête on the Thames, known as the "Water Music." This and an apology reinstated him in royal favor with an increased salary, and Handel now determined to remain in England. In 1716 he went with the court to Hanover, and wrote the music to Brockes's German poem on the "Passion of Christ."

On returning to London he was appointed musical director to the duke of Chandos, for whose chapel he composed the celebrated "Chandos Anthems," and for whom he wrote his first English oratorio, *Esther,* and the pastoral of *Acis and Galatea,* between 1718 and 1721.

He next attempted to place Italian opera in London upon a firm foundation, through the royal academy of music, which was opened in 1720, by a subscription of fifty thousand pounds from the king and nobility. He went abroad to engage a company, and his *Radamisto* achieved great success. His Italian colleagues conspired against him, however, and were encouraged by the duchess of Marlborough and her wing of fashionable society. A musical contest with his chief rival, Bononcini, resulted in Handel's triumph; but the enterprise was throughout subjected to continual hostility. His subsequent operas composed for the royal academy are: *Floridante, Ottone, Flavio, Giulio Cesare, Tamerlano, Rodelinda, Scipione, Alessandro, Admeto, Siroe* (Cyrus), *Tolomeo* (Ptolemy). In 1727 he had added to the list of his minor works the noble anthems for the coronation of George II. But the subscription was now exhausted, and the royal academy was bankrupt. In 1728 Handel formed a partnership with Heidegger, of the Haymarket theater, for which he composed the operas *Lotario, Partenope, Poro, Ezio, Sosarme, Orlando, Ariadne, Parnasso in Festa* (serenata partly new), and *Pastor Fido* (completely rearranged). In 1733 he discharged his principal singer, Senesino, for misconduct, and a coalition was formed against Handel and a rival opera established; but he brought a new company from Italy, and continued until the close of his engagement with Heidegger in 1734. He then removed to Covent Garden, and brought out, besides his music to Dryden's *Alexander's Feast,* the operas *Ariodante, Atalanta, Arminio, Giustino,* and *Berenice.* Handel had saved ten thousand pounds during his musical career on the continent and in England; but he lost this and involved himself in a considerable debt in an attempt to carry on the opera single-handed against such violent opposition. His cherished project had to be abandoned, and then, with shattered health and bankruptcy before him, he applied himself to sacred music and his famous oratorios, the works by which he finally achieved his lasting reputation. In May 1737 he closed his theater, with heavy losses.

The oratorio, *Deborah,* had been composed in 1733, followed by *Alexander's Feast* in 1736, *Saul, Israel in Egypt,* in 1738, and, in 1740, *L'Allegro, il Penseroso.* For the funeral of Queen Caroline in 1737 he wrote an anthem which is one of his grandest and most touching works; while in 1738 his operas, *Faramondo, Alessandro Severo,* and *Serse* (Xerxes), were brought out by Heidegger, a noted impressario. In the end of 1741 he went to Dublin, where the *Messiah,* composed in that year, was produced for charitable purposes. He remained in Dublin about nine months and received a generous support. From this time success attended all his undertakings. On his return to London he composed the *Samson;* and the *Messiah* was performed for the benefit of the foundling hospital. It was repeated annually for the same purpose, and from 1749 to 1777 brought to that charity ten thousand three hundred pounds.

Handel now resolved to give concerts of sacred music. These were so successful that he continued them annually, and, in the course of ten years not only paid off all his debts, but also saved about twenty thousand pounds. His excessive labor had weakened his eyesight, and three operations for cataract undertaken to relieve him were unsuccessful. In the end, 1751, Handel, like Bach, became blind; and his pupil, John Christian Smith, aided him in conducting his oratorios, as well as acted as his amanuensis in making additions and changes. When he appeared in public at his concerts he had to be led to the organ, and the grand old man was brought forward to receive the applause of the audience. The new works of these latter years were: *Judas Maccabæus*, *Alexander*, *Joshua*, *Susannah*, *Solomon*, *Theodora*, *Choice of Hercules*, and *Jephtha*, the last of this stupendous series of dramatic oratorios.

The intense activity he had displayed through life began to tell on his bodily strength, also; this gradually declined, and, on the seventeenth anniversary of his first performance of the *Messiah*, April 13, 1759, Handel died in his seventy-fourth year. He was buried in Westminster abbey.

Handel possessed noble and handsome features, which he retained even in old age. His figure was tall and erect, though stout; and his manner, when not agitated, expressed an agreeable disposition. He was liberal, much interested in charity, but at times extremely choleric. To his frequent quarrels with his singers was due chiefly his failure as a manager. He shunned society, never leaving his house except on business. He refused to see visitors, and admitted only three friends to his presence — his pupil, Smith, a painter, Goupy, and a dyer, Hurter. He was never known to have the slightest affection for any woman, and lived to the end in the most rigorous celibacy.

Considering the multiplicity of his employments as director of concerts and operatic manager, it is still a wonder how Handel ever found time to write the fifty operas, twenty oratorios, and great quantity of church music, cantatas, songs, and instrumental pieces which time has preserved for us. His compositions were written with a rapidity without a parallel in musical history. The only relaxation which he sought was in improvising them on a harpsichord, the keys of which were thummed into spoon-shaped cavities by his incessant practice. The *Messiah*, it is said, was composed in only twenty-three days.

While it is unquestionably true that Handel's art was universal, yet in a degree he was influenced by the national spirit of his adopted country. His reputation and popularity, in fact, were for a long time far greater in England than in Germany, France, and continental Europe generally. His massive choral effects were exactly suited to impress a people saturated with biblical ideas, and accustomed to public demonstrations of national and patriotic enthusiasm. He was thus in a singular degree the musical expression of the England of Marlborough, Chatham, De Foe, and Wesley. No artist in any line more deeply touched the national fiber; and none ever more completely vivified patriotic aspirations and religious fervor in masses of people. "Handel Festivals" not only grew in popularity throughout Great Britain, but have since extended to every part of the civilized world. His operas are now seldom performed, but his oratorios hold the same place in music that the plays of Shakespeare do in English drama.

In no art are the idols of one age displaced by the idols of the next so quickly or so effectually as in music. The melody which drew enchanted tears from the eyes of one generation falls flat and insipid on the ears of the next, and creates wonder how the idol ever came to be worshiped, or what strange taste could find beauty in such an oddity. If the test of genius in a work is its power to move the hearts of succeeding generations long after its author and his coterie of friends have passed away, then Handel's *Messiah* deserves to rank with the plays of Shakespeare, the madonnas of Italian and Spanish art, and the marbles of Phidias. All the luxury of modern instrumentation can add nothing to the grandeur and effectiveness of his choral masterpieces. Mozart attempted the task in vain, and Beethoven declared that the simplicity of the means by which Handel had produced such grand effects was little short of magic. Each succeeding decade seems but to add fresh glory to his noble songs; while nearly every other form of musical art is chopped and changed about to suit the passing fashion of the day.

Beethoven called Handel the greatest composer that ever lived. He possessed an inexhaustible fund of melody of the richest and noblest character; an almost unparalleled power of musical expression; an unlimited command of all the resources of contrapuntal and fugal science; a power of wielding huge masses of tone with the most perfect ease and felicity. But perhaps his leading characteristic was the grandeur, majesty, and sublimity of his conceptions. He carried the old forms of opera to their highest perfection; infused a new life and power into English ecclesiastical music; was as an instrumental composer equaled by none but Bach, and in one direction surpassed all others who have written. If not the creator, he was the perfecter of the dramatic oratorio, and reached a height in the *Messiah, Israel in Egypt, Samson*, and *Judas Maccabæus* whereon he stands alone.

Victor Schoelcher, in his *Life of Handel*, reiterates and intensifies this estimate of Handel. "Grandeur is the distinctive characteristic which dominates over all the compositions of Handel. Even in the exquisite gracefulness of *Acis and Galatea* there is a latent vigor, a certain solemnity of style, which elevates whilst it chains the mind. Every one is struck with this. So true is it, that critics, biographers, friends, and enemies all concur in speaking of him as a 'colossus,' a 'giant,' a 'man mountain.' His atmosphere is the immensity resplendent with the sun. Like Corneille, he lived in the sublime. * * * Handel has treated all styles, and has excelled in all, whether the subject be gay or serious, light or solemn, profane or sacred. He would be the Shakespeare of music if he were not the Michaelangelo. * * * In that musical Olympus the most divine masters have given to Handel the place of Jupiter Tonans."

"He is the father of us all," exclaimed the patriarchal Haydn. "Handel," said the dogmatic Mozart, "knows better than any one of us what is capable of producing a great effect; when he chooses he can strike like a thunderbolt." The lyrical Beethoven called him "the monarch of the musical kingdom. He was the greatest composer that ever lived," said he to Mr. Moscheles. "I would uncover my head, and kneel before his tomb."

JOHANN WOLFGANG AMADEUS MOZART, famous Austrian composer, and chief founder of the opera, was born at Salzburg, Austria, January 27, 1756. He was the son of Leopold Mozart, a violinist of talent, in the service of the archbishop of Salzburg, and was reared to music almost from the cradle. In many respects, indeed, he was the greatest genius in the whole history of music.

When three years old the child Mozart attracted attention by his evident delight in seeking out and striking chords on the piano; thirds and sixths specially pleased him. The musical lessons of his sister, five years older, he learned easily, and, under the happy tuition of his father, began himself to take lessons in his fourth year. The boy had an exquisite ear for pitch, and could detect a slight difference in the tuning of a violin with singular accuracy. His sister was an admirable player on the harpsichord in her eleventh year.

The father, whose position as vice chapel master at Salzburg was a poorly paid one, determined to give concerts in various cities to exhibit the precocious talent of his children. Mozart with his sister made his first appearance in public at Munich in his sixth year, afterward visiting Vienna, Paris, and London, everywhere exciting astonishment, even among old musicians, by his wonderful musical abilities. He could play on the organ, harpsichord, piano, and violin, accompany French and Italian songs at sight, and readily transpose them into different keys.

The boy's exquisite sensibility colored all his actions. He sought the love and friendship of all who came near him with a child-like simplicity that made him a general favorite. One day as he sat in the lap of the empress of Austria, he lost his balance and slipped down on the floor. One of the daughters of the empress, Marie Antoinette, afterward the unfortunate queen of France, hastened to lift him up and soothe him. "You are very kind," said the little artist of six years. "I will marry you." "Why her, rather than one of my other daughters?" asked the empress. "Out of gratitude," said Mozart. "She was very good to me, while her sisters never stirred to help me." To all who came near him he asked one constant question, "Do you love me?" And his little eyes filled with tears if an answer were not quickly given. For his father he had the fondest respect. "God first and then papa," was a motto he frequently repeated.

After making the tour of Europe, his father returned to Salzburg and set to work to give his son a thorough musical education in theory and practice. He bestowed the greatest care on his education, assisting and encouraging all his youthful efforts in composition with the enthusiasm of an artist added to a father's pride. Happy would it have been for poor Mozart if all his later surroundings had been of an equally loving kind. He studied the works of the famous organists of Germany and those of the old Italian masters, and it was this happy combination in his studies of two wholly different schools that prepared him for the task on which his reputation chiefly rests, that of fusing together into a single work the severe harmony of German music with the charming melody of Italy.

The position of the family at Salzburg was a hard and unpleasant one, for the father was wretchedly paid. They were obliged to travel about giving concerts to keep out of debt; and, up to the age of seventeen, Mozart was engaged in a long series of journeys over Europe, chiefly in the court cities of Germany, and the great continental capitals. In all of them his marvelous genius created the utmost enthusiasm. He played, composed elaborate pieces, and improvised, besides exhibiting various feats of a somewhat dubious value. They finally arrived in Salzburg in 1766, and again in 1768 were at the court of Vienna. While there the emperor urged Mozart to compose an opera and conduct it. *La Finta Semplice* was the result, and it was performed both at the capital and at Salzburg.

At the age of fifteen he traveled in Italy, composed and produced the opera of "Mithradates" at Milan in 1770, and was overwhelmed with applause and distinctions. At sixteen he was the foremost player on the clavichord in the world; had produced two requiems and a stabat mater, numerous offertories, hymns, and motets, four operas, two cantatas, thirteen symphonies, twenty-four pianoforte sonatas, not to speak of a vast number of concertos for different instruments, trios, quartets, marches, and other minor pieces.

These ten years of wandering in boyhood from 1763 to 1773 could not but be a terrible strain on a lad of intense susceptibility and ardent genius. He sought employment elsewhere without success. He went to Paris in 1778, when the contest between the rival musical systems of Gluck and Piccini was at its height, and for six months vainly sought an opportunity to produce an opera. The death of his mother, who had accompanied him to Paris, was a severe blow to him, and he returned to Salzburg at his father's request just as his prospects in Paris began to brighten. The time spent in Paris had not, however, been wasted, for he had the opportunity of hearing the various kinds of opera then in vogue.

He was now appointed concert master and organist at Salzburg with a small salary, and permission to travel occasionally to perform his new works in larger cities. His opera, *Idomeneo*, was composed in 1780 for the Italian opera at Munich, and was received with great applause in spite of its novelty. This work belonged to no existing school of music. It was as original in its phraseology and development as in its modulation, harmony, and instrumentation, and introduced a new epoch in dramatic music which has not ceased to influence the stage even to-day.

This great opera, it is said, Mozart composed to win the good graces of the Weber family, whose acquaintance he had made during a previous visit to Mannheim, and who now were destined to affect very intimately his succeeding years. The Webers were a musical family. Fridolin von Weber, its head, was a copyist and prompter at the Mannheim theater. His eldest daughter, Josepha, subsequently Frau Hofer, was the prima donna for whom Mozart wrote in later years the "Queen of the Night" in his "Magic Flute." Aloysia, a younger daughter, was a pupil of Mozart's for some time, and he was not long in falling in love with her. The Webers, however, did not view such an alliance favorably on the ground that Mozart's reputation was not at that time sufficiently established. Nor was the love of his youthful sweetheart itself of long duration, though, in after years, as the celebrated prima donna, Frau Lange, she did more than any other singer to make his music famous.

In 1781 Mozart accompanied the archbishop of Salzburg to Vienna, and there, with some journeys to other cities and countries, the rest of his short life was passed. Here he took up his residence with the Webers, who had now removed there from Mannheim. His father remonstrated with him for this and he sought other lodgings. But he had already fallen in love with Constanza, a sister of his former sweetheart, and in spite of remonstrances he married her. She proved an affectionate wife, and their marriage was a happy one, notwithstanding the hardships which constantly confronted them, largely due to his thriftless genius, and her incapacity to manage.

Mozart's master, the archbishop of Salzburg, a man of very boorish manners, treated him as if he were a domestic servant, and seemed to be jealous of the applause the young musician won from his admirers. At last Mozart gave up his miserable situation under him, and determined to support himself and his young wife by giving concerts and music lessons. These yielded him a scanty and irregular livelihood, but still permitted him to devote considerable time to his own original work. Emperor Joseph of Austria tried to found a German operatic school, and Mozart wrote his "Abduction from the Seraglio" to promote this idea. There was, however, strong opposition displayed by the lovers of Italian music at Vienna, and both the opera and the project failed.

After incessant rebuffs and amidst violent intrigues, in 1786 he set "The Marriage of Figaro" to music as an Italian opera. The piece was successful, though violently assailed by his rivals and opponents. He was then thirty years old, and it marks the high tide of his genius; but the composer received little but applause. At Prague its reception was so favorable that Mozart was induced to visit that city, and here he spent the happiest period of his life. His master opera of *Don Giovanni* was written in 1787 at Prague, and met with great success there, although coldly received at Vienna. Both of these operas he conducted in person, for which he received a salary of about four hundred dollars. In 1788 he returned to Vienna, and now came the busiest period of his life. Journeys followed to Dresden, Berlin, Leipzig, and Frankfort, at all of which he gave concerts which brought him nothing but fame.

It was at this time he began to feel symptoms of a disease of the lungs, coupled with a nervous affection, which often threw him into fits of melancholy. He worked feverishly to drive away his sad thoughts, composing with incredible rapidity, yet all this work bears the stamp of genius and perfection. The fear of an early death took possession of his mind. He thought he had not done enough work to establish his reputation, and he exhausted his strength by incessant labor day and night.

It was in this condition he composed "The Magic Flute," an opera wholly unlike anything he had written before. That a dying man could fill a fairy tale with the beauty and freshness of the melody he wrote for it seems scarcely credible. This opera had an unexampled success at Vienna. It was played no less than one hundred twenty successive times, and was hailed with enthusiasm over all Germany. While he was at work on "The Magic Flute," a mysterious stranger applied to him to compose a *Requiem*, and paid for it handsomely in advance. Mozart's health was already shattered by his intense labor, and, being unable to discover the name of the stranger, the event preyed on his mind until he fancied there was something supernatural about it. He worked at it with the firm conviction that it was his own requiem; nothing could dispel the fatal delusion. His wife and friends tried in vain to distract his attention, but he continued to work on with restless energy until illness confined him to his bed.

His presentiment was true. The *Requiem* was never finished; but he sketched out the principal features of the uncompleted part, leaving them for his pupil, Süssmayer, to fill out. On November 15th, though visibly dying, he composed a cantata, and conducted it himself; but he was forced to take to his bed, where he labored at his *Requiem*, consumed with fever and anxiety. On December 4th he had the score brought to his bedside, tried a passage, singing the alto himself; but his strength gave way; he burst into tears, and put aside the score. But up to midnight he continued to give directions, and was seen, in delirium, to be puffing his cheeks to imitate the action of the drums. By one o'clock in the morning of December 5, 1791, he was no more. The next day, without music and with no friends around the coffin, Mozart was laid in the common grave of St. Marx churchyard at Vienna. Research has failed to identify the exact spot, nor can his bones be found. So ended the greatest of musicians at the age of thirty-five.

It is now generally believed that the mysterious commission for the *Requiem* came from Count Walsegg, a musician of some note, whose evident purpose was to keep his identity from Mozart, and have the work performed as his own.

While practically on his death bed, Mozart was nominated chapel master to St. Etienne cathedral; and another, still better appointment was offered him at Amsterdam. The ill-fortune which pursued him through life with brutal masters and petty rivalries filled up the cup by dangling fame and wealth before his dying eyes.

In stature, Mozart was short, with a pleasant countenance, beautiful hands and feet, hair and eyes. His physical delicacy detracted much from his personal impressiveness, and left little to recommend him except a childlike simplicity and lovable nature. He was affectionate, generous, sociable, joyous, and sympathetic; but at the same time careless, improvident, and not uniformly abstemious. He has been well compared with Raphael, inasmuch as both were artists — at least in the modern world both lived in one unbroken life of beauty, and both have clothed with instinctive grace every side of their art and of life.

In looking over the long list of his works, it is astonishing to think a man, who spent so much of his time in traveling about giving concerts and who died in his thirty-fifth year, could ever have found time to accomplish so much. He wrote eight hundred works of various kinds, comprising eighteen operas, forty-nine symphonies, fifteen overtures, seventy pieces of sacred music, not to speak of an immense quantity of work he began but left uncompleted. No musician of any epoch has possessed so universal a genius for all the departments of musical art — song, sonata, concerto, symphony, mass, and opera. He was the greatest pianist of his time in Germany; his cantatas bear the inspiration of a true religious spirit; and in the opera he effected nothing less than a complete transformation. No other master has left an equal number of exquisite airs of which the world is never tired. *Idomeneo* was a revolution in the lyrical drama. In construction, detail, instrumentation, and every imaginable respect, it was an enormous advance on all previous works of the kind. The change was carried to its highest pitch in "The Marriage of Figaro"; and the romantic opera may almost be said to have been created by *Don Giovanni* and *Die Zauberflöte.* His genius rose steadily without a sign of feebleness to the day of his death, and, had he lived a few years longer, still grander works than these might have been expected from his fertile brain.

But it is not so much the quantity as the excellence of his music which excites the astonishment of the musician. This was owing not more to the greatness of his genius than to his profound studies, which from infancy to the close of his life never ceased. As an instrumental composer perhaps one only has surpassed him, Beethoven; but Beethoven had perfected his genius by studying Mozart. Haydn had developed the quartet form and invented the grand symphony. Mozart gave them a new spirit, and one sees his influence in all Haydn's later works. The symphony in C with the fugue is the greatest work of the kind ever written before Beethoven.

Mozart is the first composer in whose works all traces of the old tonality disappear; he is the father of the modern school. No composer has ever combined genius and learning in such perfect proportions; none has ever been able to dignify the lightest and tritest forms by such profound scholarship, or, at the moment when he was drawing most largely on the resources of musical science, to appear so natural, so spontaneous, and so thoroughly at ease.

"In musical art," observes Frederic Harrison, "the test of power to impress the imagina-

tion of numbers in various ages and races is decisive. The philosopher, the man of science, the inventor, can produce his vast social efforts indirectly through the medium of other minds. It is enough that Aristotle, Kepler, Newton, Descartes, Gutenberg, are followed by competent minds who can give to posterity the results of their work. Even in poetry it is enough that Æschylus and Dante have given to mankind eternal types of tragedy and sacred poem, which the masses of men know only by repute. But in music the business is to delight, to touch the soul, and to elevate the spirit; and its effects can be indirectly extended in a much less degree. It is not the business of musical creation to astonish a coterie or to delight a company of virtuosos. When in art men talk of 'learning,' 'profundity,' and 'subjective consciousness,' we know that they are passing into the field of abstract science, not of concrete expression. Music must rouse enthusiasm in races and throughout ages. Judged by this test, the supremacy of Mozart is plain. 'The bewitching melody of Mozart,' in the language of Sir Archibald Alison, 'will captivate mankind to the end of the world.' "

LUDWIG VAN BEETHOVEN, the greatest of all composers, with the possible exception of Mozart, though of Dutch extraction, was a native of Bonn, Prussia, where he was born about December 16, 1770. His father, Johann van Beethoven, was a tenor singer in the chapel of the elector of Cologne, and married the daughter of a cook at the elector's palace.

Unlike Mozart, young Beethoven showed little or no predilection for musical studies, but his father compelled him to practice on the harpsichord daily in his fourth year. It was not until he had made some progress in his art that his ardor began to be excited. Mozart was a musician by instinct. Beethoven's musical inclinations were intellectual rather than intuitive, and had to be awakened before his interest was excited. His early teachers, Pfeiffer and Van der Eden, laid the foundation for the technical skill which afterward made him one of the greatest pianists of Germany, and a later teacher, Neefe, made him familiar with the grand conceptions of Bach and Handel.

For these works he had an admiration that became a kind of worship in after life. When eleven years old, it is said he could play the whole of Bach's pianoforte exercises, and had already shown the bent of his genius by composing three sonatas. At this period he also appeared in Holland as a piano virtuoso, chiefly of Bach's music, and was made the assistant of Neefe at the organ in elector's chapel. In his thirteenth year he published, at Mannheim, a volume of marches, songs, and sonatas, and the year following earned about seventy-five dollars as second court organist.

In the year 1787 he went to Vienna, at the expense of the elector of Cologne, to study with Mozart, from whom he received only a few lessons when he was recalled to Bonn by the illness of his mother, who died shortly afterward. From this time on he became the main support of his family. The death of his mother was a severe blow to him, and removed from his life his "best friend," as he frequently styles her in his letters, in contrast with his father, who was both shiftless and intemperate. His natural talent and refinement began to assert themselves in spite of his unpleasant home surroundings, and he now began to give lessons, and to make an occasional public appearance. He included among his early friends many lovers of music, including the Von Breunings, Archduke Rudolph, Baron van Swieten, and Count

Waldstein — all of whom took an extraordinary interest in his future career as indicated by his dedications.

An early love affair with Babette Koch, the attractive daughter of the proprietress of the Zehrgarten at Mannheim, began about this time, but was interrupted by the plans of the elector, who arranged to send Beethoven again to Vienna. Accordingly, in 1792, his two younger brothers having found employment, he returned to Vienna, where, with the exception of short voyages undertaken for business or pleasure, he remained for the rest of his days.

The first five years of his residence at Vienna were the happiest of his life. He had excellent patrons, was received into the best society, and became a general favorite by his admirable skill on the harpsichord, although his manners and temper were not of the kind to make or keep friends. When he arrived at Vienna, he possessed a rare talent for execution, but very little knowledge of harmony or composition. There he studied under Haydn and Albrechtsberger. His rapid progress in the study of musical form is due to his own unaided efforts, rather than to any assistance he received from his teachers, whose methods were too scholastic to please his original tastes.

About 1795 he made his debut in Vienna as a pianist, and with his "Concerto in C major" he created a great impression. He also took part in a benefit concert for the relief of Mozart's widow and children, and attracted attention by his extraordinary ability as an extempore player of fantasias. His compositions, too, produced a great stir in the musical world; for it was in this year that his *Opus I* appeared, containing his three trios for the piano. As a relaxation from music, Beethoven's ardent interest in general literature — which hitherto had suffered far too great a neglect on his part — received a fresh impetus, and he was smitten with a veritable passion for reading. He read the great German poets, the works of Homer, Vergil, Tacitus, and this absorption had a tendency to soften in some measure the troubles and afflictions which afterward were his heritage. From about 1798 he was afflicted with a defect in hearing which gave him much concern. His highly sensitive nature was so perturbed over it that in 1800 he wrote a letter to one of his friends enjoining him to keep it "a profound secret." In 1814, or earlier, the loss of his hearing was complete, and so sorely affected him that the character of his compositions were even tinged with a passionate melancholy. It saddened his thoughts, and was the cause of the fits of ill-temper and misanthropic tendencies he manifested ever after.

Before the end of the year 1800, Beethoven had composed twenty sonatas for the pianoforte, a large number of trios and quartets, as well as his first and second symphonies. The sale of his musical publications brought him very little money, and his position for some years was not an easy one. A pension was at length settled upon him on condition that he should continue to live in Austria. Then he fixed his residence at Baden, a pretty village near Vienna; and there he would walk about for hours in the most unfrequented spots, shunning all companionship, composing as he walked.

It was his habit never to write down a single note until the whole piece was complete in his head; but this habit did not prevent his correcting and modifying the manuscripts until he was satisfied with them. His works had already placed him in a high position among composers, when the calamity of his deafness fell upon him, and his productiveness in the year immediately following gives remarkable evidence of his fortitude during the years of bitter trial — doubly bitter to a musician. Among these were a sonata containing the well-known funeral march; the so-called "Moonlight Sonata"; the *Kreutzer Sonata*, written for piano and violin, in 1803; the "Heroic Symphony," in 1804; and his one opera, *Fidelio*, written in 1805, but subsequently revised on several occasions. He did not write a second opera because he could get no libretto of a sufficiently elevated character which he thought essential, and which alone he would consent to consider.

Though friends and admirers surrounded him during these years, he yet led a solitary life, and frequently changed his lodgings to avoid visitors. To add to his troubles, he became involved in a law suit relating to the custody of his nephew, and for several years he produced but few new works. This nephew was wholly unworthy of the affection Beethoven lavished upon him. The boy failed to pass his school examination, and made an unsuccessful attempt to commit suicide. As this was an offense against the laws of Austria, Beethoven was compelled to remove his nephew from Vienna.

Beethoven's fourth, fifth, and sixth symphonies and the "Mass in C" were composed between 1805 and 1810. The music to Kotzebue's "Ruins of Athens" was first performed in 1812; the "Battle Symphony" in 1813; the cantata, "The Glorious Moment," at the Vienna congress in 1814; and the eighth symphony was written in 1814, when he was totally deaf. The principal productions of the last ten years of his life were several great sonatas for the pianoforte; the grand "Mass in D," a three years' labor; the overture in C, op. 115; the ninth symphony with chorus, the greatest of his productions, completed in 1823; and the last grand quartets.

The last four years of the composer's life were passed amid great distress from poverty and feebleness. He could compose but little; and, though his friends solaced his latter days with attention and kindness, his sturdy independence would not accept them. It is a touching fact that Beethoven voluntarily suffered want and privation in his last years, that he might leave the more to his selfish and ungrateful nephew. He went to reside on his brother's estate on the Danube, but the society of his brother's family became insupportable, and he returned to Vienna in 1826. The return journey was undertaken in cold, wet weather, he caught a severe cold, which brought on inflammation of the lungs, succeeded by dropsy, and he died in Vienna, March 26, 1827, in his fifty-seventh year. His death took place during a frightful thunderstorm, and prompted, no doubt, by the keen burden his soul had borne so long, his last words were, "I shall hear in heaven." His remains were laid in Wahring cemetery, near Vienna.

In 1802, in expectation of death, Beethoven addressed to his brother a testamentary letter, or will, which speaks more eloquently of the hidden life of an heroic soul than any other words could do. From this letter we cannot refrain from reproducing the following extracts:

"O ye, who consider or declare me to be hostile, obstinate, or misanthropic, what injustice ye do me! Ye know not the secret causes of that which to you wears such an appearance. My heart and my mind were from childhood prone to the tender feelings of affection. Nay, I was always disposed even to perform great actions. But only consider that for the last six years I have been attacked by an incurable complaint, aggravated by the unskillful treatment of medical men, disappointed from year to year in the hope of relief, and at last obliged to submit to the endurance of an evil the cure of which may last perhaps for years, if it is practicable at all. Born with a lively, ardent disposition, susceptible to the diversions of society, I was forced at an early age to renounce them, and to pass my life in seclusion.

"If I strove at any time to set myself above all this, oh how cruelly was I driven back by the doubly painful experience of my defective hearing! And yet it was not possible for me to say to people, 'Speak louder — bawl — for I am deaf!' Ah! how could I proclaim a defect of a sense that I once possessed in the highest perfection — in a perfection in which few of my colleagues possess or ever did possess it? Indeed, I can not! Forgive me, then, if ye see me draw back when I would gladly mingle among you. Doubly mortifying is my misfortune to me, as it must tend to cause me to be misconceived. From recreation in the society of my fellow creatures, from the pleasures of conversation, from the effusions of friendship, I am cut off. Almost alone in the world, I dare not venture into society more than absolute necessity requires. I am obliged to live as an exile. If I go into company, a painful anxiety comes over me, since I am apprehensive of being exposed to the danger of betraying my situation. Such has been my state, too, during this half year that I have spent in the country. Enjoined by my intelligent physician to spare my hearing as much as possible, I have been almost encouraged by him in my present natural disposition, though, hurried away by my fondness for society, I sometimes suffered myself to be enticed into it.

"But what a humiliation when any one standing beside me could hear at a distance a flute that I could not hear, or any one heard the shepherd singing, and I could not distinguish a sound! Such circumstances brought me to the brink of despair, and had wellnigh made me put an end to my life: nothing but my art held my hand. Ah! it seemed to me impossible to quit the world before I had produced all that I felt myself called to accomplish. And so I endured this wretched life — so truly wretched, that a somewhat speedy change is capable of transporting me from the best into the worst condition. Patience — so I am told — I must choose for my guide. Steadfast, I hope, will be my resolution to persevere, till it shall please the inexorable Fates to cut the thread.

"Perhaps there may be an amendment — perhaps not; I am prepared for the worst — I, who so early as my twenty-eighth year was forced to become a philosopher — it is not easy — for the artist more difficult than for any other. O God! Thou lookest down upon my misery; Thou knowest that it is accompanied with love of my fellow creatures, and a disposition to do good! O men! when ye shall read this, think that ye have wronged me; and let the child of affliction take comfort on finding one like himself, who, in spite of all the impediments of Nature, yet did all that lay in his power to obtain admittance into the rank of worthy artists and men.

"I go to meet Death with joy. If he comes before I have had occasion to develop all my professional abilities, he will come too soon for me, in spite of my hard fate, and I should wish that he had delayed his arrival. But even then I am content, for he will release me from a state of endless suffering. Come when thou wilt, I shall meet thee with firmness. Farewell, and do not quite forget me after I am dead; I have deserved that you should think of me, for in my lifetime I have thought of you to make you happy. May you ever be so."

Beethoven was never married, but his heart was more than once sensibly affected by the tender passion, even in his mature years. His "Moonlight Sonata" was inspired by Countess Guicciardi, "who loves me, and whom I love," he says in his dedication, but "unluckily, she is not in my rank of life." He also had a love affair with Eleonora von Breuning, who married another; with Countess Braunsschweig, one of his pupils, to whom he was engaged for four years; another with Bettina Brentano; still another with Marie Pachler-Koschak, whom, he says, "alone I wished to possess, but never shall call mine"; and, finally, with Countess Erdödy, who erected a temple to him in her park, as a memorial.

Rochlitz, who visited Beethoven in his later years, thus describes his personal appearance: He was of short stature, thick-set and bony, slightly round-shouldered, with a full face, somewhat flushed, and brilliant piercing eyes that seemed to transfix you. His thick black hair fell in uncombed masses round his magnificent head. There was no play in the features, nor in the eyes so full of life and genius, but an expression of benevolence and timidity wholly unlike the character his fits of passion gave him. In all his manner, one could see the strained attention to catch every sound, noticeable in the manner of deaf persons of a sensitive temperament. He would speak gaily for a minute, and then sink into a profound silence. His voice was rough on occasions, but when he was touched it had a light tone that was peculiarly affecting.

His character was simplicity itself; falsehood was absolutely foreign to his nature, and he carried truth and sincerity into *brusquerie*, and often into shocking rudeness. The books are full of stories of this, which can not be given here. And yet so great was the influence of his personality that those to whom he was rudest were fondest of him. Princes, cardinals, high-born beautiful ladies, women like Rahel, and men like Goethe were devoted to him, and put up with every unpunctuality and incivility.

His simplicity sometimes became credulity, blinded him to real facts, and made him often unfair and harsh. This showed itself unjustifiably toward his relations, and toward many of his best and truest friends. Such conduct must have been greatly due to his deafness, his sensitive nature, and his absorption in his music, and he was always ready to confess his error. He was full of the deepest feeling, and there is something wonderfully touching in his devotion to his nephew, one of the meanest, most graceless scamps on record; but on whom, partly because he was left to him, partly because of his craving for affection, he lavished all his tenderness. His nature and his deafness drove his goodness inward, and we must look to his music, and to the mystical aspirations with which he salutes God in the sunrise, or the beauty of the woods, for the deeply religious feelings of his great heart.

Though a Catholic by birth, and dying in that faith, he had little formal religion; and yet a more deeply religious mind never existed. In every trial his thoughts flew upward, and his note books are full of the most passionate ejaculations. God was to him the most solemn and intimate reality, whom he saw and welcomed through all aspects of nature, and in every mood of joy and sorrow. Living in a profligate city, and in a time of the loosest morals, and himself singularly attractive to women, his name is not connected with a single *liaison* or scandal.

He treated his pianoforte as an intimate friend, to whom he could confide his thoughts and secrets, and taught it to respond in sympathy with all his innermost feelings, making his music the medium for communicating the feelings which swelled his own breast.

The works of Beethoven may be divided into three classes, or may be assigned to three distinct periods of his intellectual development. All the works of his first period, though important, show the influence of his teacher, Haydn, or of his more highly esteemed model, Mozart. This period of composition may be said to extend to his sixteenth orchestral work, including, besides several pianoforte sonatas, trios for pianoforte and for stringed instruments. All these early works display the highest cultivation of the forms and principles of art previously established in the Viennese school of music.

The second period of Beethoven's artistic life, in which his genius was completely self-reliant, extends from the sixteenth to the eightieth work. This was certainly the most productive and brilliant part of his career. To it belonged his greatest creations, his magnificent and powerful orchestral works — symphonies, overtures, sonatas — all of which display the highest qualities of imaginative composition. Besides the great orchestral works, it includes many sonatas for pianoforte, and various compositions of chamber-music — septets, quintets, quartets, trios, serenades, and other musical forms. In dramatic composition Beethoven produced only one opera, but this was *Fidelio*, the first truly German musical work of a dramatic character. This was the result of great study, and, as it is now given, is the reconstruction of an earlier composition. Other dramatic pieces are the overture, interludes, and melodramatic music in Goethe's *Egmont*, and the instrumental music and choruses in the "Ruins of Athens."

In the third and last period of Beethoven's career we find these two gigantic works, the *Missa Solemnis* in D minor, and the ninth symphony in D minor with chorus. These works transcend all common laws and forms, and belong to the highest sphere of art. Their deep mysteries can be apprehended only by those who have deep emotions and profound technical knowledge of music. Other works of this last class approach those just mentioned though they do not reach the same elevation. But all are alike in passing far beyond the ordinary traditional forms of art. All are pervaded by an impulse as of inspiration. Among these works may be mentioned the great quartets for bow-instruments — mostly published after the death of Beethoven — the grand overtures — *Opus* 115 and 124, and several sonatas for pianoforte, especially that in B flat major.

The music of Beethoven has left a profound impress on art. In speaking of his genius it is difficult to keep expression within the limits of good taste. For who has so passed into the very inner penetralia of his great art, and revealed to the world such heights and depths of beauty and power in sound?

Barbedette, speaking of Beethoven's work and genius, says, "Bach created the typical form of the sonata, the form which is most logical, largest, and most readily adapted to the development of a serious thought, or even that of some capricious fancy, restrained within due limits by the laws of art. The first part explains the subject, and develops its plan, terminating with a brief synopsis and peroration, then comes a slow movement, lending itself to the inspiration of melancholy, dreamy thoughts; this is followed by a third part, reveling in wild fantasie; and the whole ends with a fourth, of a lively captivating character, leaving the auditor under the influence of a pleasing impression. Such is the framework of the sonata, on which, for more than a century, all the great composers have exercised their genius. Haydn composed sonatas for a whole orchestra, and created the quartet and symphony. Mozart modified it to form the concerto, by making it a grand composition, rich in effects. While Beethoven — passionate, poetic Beethoven — took his predecessors' models, and surpassed them all. He made few innovations on the traditional form of the sonata. He has enriched it with the scherzo, a ravishing interlude that takes the place of the old minuet (the third part). When he does depart from the classical form, it is in his musical trifles, charming in themselves, but only the amusement of a great composer."

Beyond this Beethoven composed nine symphonies, which, by one voice, are ranked as the greatest ever written, reaching in the last — known as the "Choral" — the full perfection of his power and experience. Other musicians have composed symphonic works remarkable for varied excellencies, but in Beethoven this form of writing seems to have attained its highest possibilities, and to have been illustrated by the greatest variety of effects, from the sublime to such as are simply beautiful and melodious. His hand swept the whole range of expression with unfaltering mastery. Some passages may seem obscure, some too elaborately wrought, some startling and abrupt, but on all is stamped the die of his great genius.

Beethoven's compositions for the piano—the sonatas—are no less notable for range and power of expression than for their adaptation to meet all the varied moods of passion and sentiment. Other pianoforte composers have given us more warm and vivid color, richer sensual effects of tone, more wild and bizarre combination, perhaps even greater sweetness in melody. But we look in vain elsewhere for the spiritual passion and poetry, the aspiration and longing, the lofty humanity, which make the Beethoven sonatas the *suspiria de profundis* of the composer's inner life. In addition to his symphonies and sonatas, he wrote the great opera, *Fidelio*, and in the field of oratorio asserted his equality with Handel and Haydn by composing "The Mount of Olives." A great variety of chamber music, masses, and songs bear the same imprint of power.

Beethoven may be rightfully called the most original and conscientious of all the composers. He seems to have been so fecund in great conceptions, so lifted on the wings of his tireless genius, so austere in artistic morality that in these respects he stands for the most part far above all other composers. His genius was universal; he embraced the whole circle of human emotions. It is not in this sense that Michaelangelo, Raphael, and Leonardo da Vinci, though they were painters, architects, and poets, at the same time were universal. Each of them represents a special phase of human nature. Beethoven felt all phases, and expressed all. The simple emotions of confiding youth, then the difficulties of life with the courage that surmounts them, the combat, the victory, and the heroic joy it brings; finally, the exhaustion of a soul broken by the struggle, the deceptions of unhappy love, the renunciations of earthly affections and thirst for the ideal, celestial contemplation, the solitary communion of man with the Infinite — this is the immense circle which his genius embraced. Goethe alone, in literature, has equaled this universality.

Beethoven's principal title to fame is in his superlative place as a symphonic composer. In the symphony music finds its highest intellectual dignity; in Beethoven the symphony has found its loftiest master.

1870	Married second wife,	57
1872–82	Settled at Bayreuth, and produced his *Nibelungen* trilogy,	59–69
1874	*Götterdämmerung*, "Twilight of the Gods,"	61
1882	*Parsifal*,	69
1883	Died at Venice, Italy,	70

WILHELM RICHARD WAGNER, the greatest composer since Beethoven, and a romantic poet and philosopher as well, was born at Leipzig, Prussia, on May 22, 1813. His father was a municipal clerk of Leipzig, who died a few months after the birth of his son. The boy's mother then married Ludwig Geyer, a playwright and portrait painter, and removed to Dresden, Saxony, where he passed his childhood.

From his father, who had a fine appreciation of poetry and the drama, Richard inherited his love for the theater; and this was stimulated, in a degree, by his stepfather. After his stepfather's death, in 1821, he was sent to the Kreuzschule in Dresden, where he received an excellent education; and, at the age of thirteen, the bent of his taste, as well as his diligence, was shown by his translation — out of school hours — of the

first twelve books of the *Odyssey.* In the following year his passion for poetry found expression in a grand tragedy. "It was a mixture," he says, "of *Hamlet* and *Lear.* Forty-two persons died in the course of the play, and for want of more characters I had to make some of them reappear as ghosts in the last act."

In 1827 the family removed from Dresden to Leipzig. Weber, who was then conductor of the Leipzig opera, seems to have attracted the boy, both by his personality and by his music, and he was deeply impressed with Beethoven's music which he heard there. His artistic and susceptible temperament was so completely captivated, indeed, that he decided to set his youthful tragedy to music. For this purpose he first tried to instruct himself in the art of composition, took some lessons from Gottlieb Müller, and finally finished an overture that was produced between acts at a theater where his eldest sister had an engagement. His individuality was impressed even on this first composition, and he then began studying under Theodor Weinlig, a teacher of considerable reputation, whom he honored throughout all his after years. About the same time — 1830 — he entered the university of Leipzig, where his student career was marked both by his individuality and brilliant talents.

From 1830 to 1833 many compositions after standard models are evidence of hard and systematic work, and in 1833 he began his long career as an operatic composer with *Die Feen,* "The Fairies," which, however, never reached the dignity of performance until 1888 — five years after his death.

He now spent several years in very unremunerative routine work in Magdeburg, Königsberg, Riga, and other places, during which period he brought out his opera, *Das Liebesverbot,* and some lesser compositions. In the year 1836 he added to his financial burdens by marrying in Königsberg an actress, Minna Planer. During the years he spent at Riga as chapel master — 1837–39 — he found time to complete the libretto and first two acts of the opera, *Rienzi,* and with this he resolved to try his fortune in Paris. With his wife he accordingly took passage in a sailing vessel from Pillau to London. The voyage was exceedingly tempestuous, and from this experience he gained the first inspiration for *Der Fliegende Holländer,* "The Flying Dutchman," subsequently one of his most successful creations. His remarkable receptivity is evidenced in this work from the fact that the wonderful tone-picture of Norway's storm-beaten shore was painted by one who until that voyage had never set eyes on the sea.

Wagner passed a week or more in London, several weeks in Boulogne, and remained in Paris from September, 1839, until April, 1842. In these three years he passed through some of the bitterest experiences of his career, and finally left Paris with *Rienzi* unperformed — in spite of the efforts of Meyerbeer in its favor — and heartsick with hope deferred. He reached such straits that he offered himself as a chorus singer at a small second-rate theater, but was refused even that humble post. However, in Paris, he finished a "Faust Overture," some sketches of "The Flying Dutchman," and revised his *Rienzi.* "The Flying Dutchman" was also offered to the authorities of the grand opera house, and refused; but the directors were so charmed with the beauty of the libretto that they bought it to be reset to music.

In 1842 he sent *Rienzi* to Dresden — and speedily followed himself — where it was produced with great enthusiasm in October of the same year, and its signal success led to his appointment as chapel master there in January, 1843. "The Flying Dutchman," produced in 1843, was not so enthusiastically received, but it has since easily distanced the earlier work in popular favor. In 1845 his new opera, *Tannhäuser,* proved at first a comparative failure in Dresden. It was produced in Weimar by Liszt, however, in 1849, with better results, and the event led to the famous friendship between Wagner and Liszt which has now become historic. The part played by Liszt in compelling public appreciation of this great opera is regarded as one of the noblest and most self-sacrificing rôles ever taken by genius. After hearing of the Weimar performance, Wagner wrote to Liszt, "I once more have courage to suffer"; while Liszt replied: "So much do I owe to your bold and high genius, to the fiery and magnificent pages of your *Tannhäuser,* that I feel quite awkward in accepting the gratitude you are good enough to express with regard to the two performances I had the honor and happiness to conduct."

The theme of *Tannhäuser,* which is founded on a well-known legend preserved in a sixteenth century ballad, had been proposed to Weber in 1814, and especially attracted

Wagner while he was in Paris. The temporary failure of the opera led him to the consideration and self-examination of his theories of composition and construction, which resulted in an elaborate exposition of his ideals, subsequently published in "Opera and Drama," and many other essays. "I saw a single possibility before me," he writes, "to induce the public to understand and participate in my aims as an artist."

Lohengrin, which had also been suggested during his stay in Paris, was finished early in 1848, and likewise the poem of "Siegfried's Death," the result of Wagner's studies in the old *Nibelungenlied.* This opera was about to be performed in Dresden in 1849, when the revolutionary outbreak took place there. Wagner was an active leader in the movement, which reigned for two short days behind the street barricades in Dresden.

A few days after the suppression of the revolution, news reached Wagner in Weimar that a warrant was issued for his arrest. With a passport procured from Liszt he fled across the frontier, first to Paris, then to Zürich, and for nearly twelve years the bitterness of exile was added to the hardship of poverty. It is this period which is mainly responsible for Wagner's polemical writings, so biting in their sarcasm, and often unfair in their attacks. This period of his musical activity also commenced to witness the development of his theories on the philosophy of his art, and some of his most remarkable critical writings were then given to the world.

In 1850 he was appointed director of the Zürich musical society and of the orchestra of the theater. Here he chiefly resided until 1859, composing *Tristan und Isolde*, and a portion of his great series of operas founded on the *Nibelungenlied*, known as the *Nibelungen* trilogy.

During these years of exile Wagner's most faithful friend and benefactor was Franz Liszt — almost his artistic twin soul. Liszt furnished Frau Wagner with means to join her husband just after the failure of the revolution; he was his provider in exile; and, in spite of the zest which came to Wagner through his passionate devotion and loyalty to his art, it is questionable whether he could have stood the strain without the aid of his brother artist so generously bestowed.

In 1850 Liszt first produced *Lohengrin* at Weimar, the greatest of solaces to Wagner. This production and the generous heart that was behind it acted as a vitalizing tonic on him. Though at a distance, he directed the productions as well as he could through numerous written instructions. This performance was one of the most important in Wagner's career. It started the now historic "Wagner question," which was fought out in a fierce war of words, with vituperation almost unheard of in art matters, on the part of Wagner's enemies, covering many years. The Wagner cause, however, forged steadily ahead, and finally emerged triumphant.

Wagner went to London in 1855 as conductor of the Philharmonic society for one season. At last, in 1861, he received permission to return to Germany, and in Vienna he had the first opportunity of hearing his own *Lohengrin.* For three years the struggle with fortune seems to have been harder than ever before, and, in broken health, he had practically determined to give up the unequal contest, when an invitation was sent him by Ludwig II., the young King Louis of Bavaria. "Come here and finish your work." Here at last was salvation for Wagner, and the rest of his life was comparatively smooth.

He settled at Munich, and with the glories of the royal opera house of that city, and subsequently at Bayreuth, his name is henceforward principally connected. In 1865 *Tristan und Isolde* was performed at Munich, and was followed three years later by a comic opera, *Die Meistersinger*, the first sketches of which date from 1845. *Siegfried* was completed in 1869, and in the following year Wagner married Cosima, the daughter of Liszt, and formerly the wife of Von Bülow. His first wife, from whom he had been separated in 1861, died at Dresden in 1866.

Wagner for a long time despaired of the visible execution of his ideas exhibited in his later operas. At last, in 1870, the celebrated pianist, Tausig, suggested an appeal to the admirers of the new music throughout the world for means to carry out the composer's great idea, viz., to perform the *Nibelungen* at a theater to be erected for the purpose, and by a select company, in the manner of a national festival, and before an audience entirely removed from the atmosphere of vulgar theatrical shows. After many delays the foundation-stone of the Bayreuth theater was laid in 1872, and in 1876 Wagner's hopes were attained, two years after the completion of the *Götterdämmerung.*

The first work given at Bayreuth was the entire trilogy. The principal celebrities of Europe and America were present to witness the perfected fruit of the composer's theories and genius. In July, 1882, Wagner's long and stormy career was magnificently crowned there by the first performance of *Parsifal*, which, with its sacred allegory, its lofty nobility of tone, and its pure mysticism, stands on a platform by itself, and is almost above criticism, or praise, or blame. The libretto alone might have won Wagner immortality, so original it is and perfect in intention; and the music seems to be no longer a mere accessory to the effect, but the very essence and fragrance of the great conception. A few weeks later his health showed signs of giving way, and he resolved to spend the winter at Venice. There he died suddenly of heart disease, on February 13, 1883, at the Palazzo Vendramin. He was buried in the garden of his own house "Wahnfried" at Bayreuth.

It is a remarkable coincidence that in the very town of Bayreuth, where since 1876 the Wagner festivals have been held, Jean Paul Richter, in a preface to a book, wrote the half-prophetic words: "Hitherto, Apollo has always distributed the poetic gift with his right hand, the musical with his left to two persons so widely apart that up to this hour we are still waiting for the man who will create a genuine opera by writing both its text and its music."

This is precisely what Richard Wagner did. He was a musician of the highest type, and was a poet of supreme eminence in the field of romantic drama with scarcely a rival. He possessed a genius for reconstructing in form and spirit the splendid conceptions of the legendary ages, and infusing into the characters of that heroic time the more complicated emotions of our modern days; and this he did with a power of dramatic construction, and a depth of poetic imagination, that rank him among the great romantic poets of the nineteenth century.

When Schopenhauer, the famous philosopher, read the text of the *Nibelungen* trilogy, he exclaimed, "The fellow is a poet, not a musician"; and again, "He ought to hang music on the nail; he has more genius for poetry." But the might of Wagner's musical genius long obscured the poet's fame. Critics continued to sneer at the lines long after they had conceded the merit of the scores; but it is a crowning tribute to the greatness of the poet-composer, that now a whole literature has arisen around his operas as poems, and the process still goes on. It is now universally acknowledged that Wagner can only be compared with the greatest names in music. His instrumentation has the advantage of being the inheritor of the enormous development of the orchestra from Haydn to Berlioz, his harmony is as original and daring as Bach's, and his melody is as beautiful as it is different from Beethoven's or Mozart's.

His aim was to reform the whole structure of opera, using the last or "Beethoven" development of instrumental music as a basis, and freeing it from the fetters which conventionality had imposed in the shape of set forms, in a style of singing now happily almost extinct. In this "art work of the future," as he called it, the interest of the drama is to depend not entirely on the music, but also on the poem and on the acting and staging as well. Theme, verse, and melody must unite in one exquisite rhythm in which it is impossible to separate the one from the other.

The first radical development of Wagner's theories we see in "The Flying Dutchman." In *Tannhäuser* and *Lohengrin* they find full sway. For a while he oscillated between history and legend, as best adapted to furnish his material, but finally selected the dreamland of myth and legend. He saw the utter incongruity of any dramatic picture of ordinary events, or ordinary personages, finding expression in musical utterance. Even characters set in the comparatively near background of history he conceived to be too closely related to our own familiar surroundings of thought and mood to be regarded as artistically natural in the use of music. But within the dim and heroic shapes that haunt the borderland of the supernatural, which we call legend, the case is far different. This is the drama of the demigods, living in a different atmosphere from our own, however akin to ours may be their passions and purposes. For these we are no longer compelled to regard the medium of music as a forced and untruthful expression, for do they not dwell in the magic lands of the imagination? All sense of dramatic inconsistency instantly vanishes, and the conditions of artistic illusion are perfect.

"'Tis distance lends enchantment to the view,
And clothes the mountains with their azure hue."

Thus all of Wagner's works, from *Der Fliegende Holländer* to the *Nibelungenlied*, have been located in the world of myth, in obedience to a profound art principle. The opera of *Tristan und Isolde*, first performed in 1865, announced Wagner's absolute emancipation, in the construction both of music and poetry from the time-honored and time-corrupted canons, and, aside from the last great work, it may be received as the most perfect representation of his school.

The third main feature in Wagner's music is the wonderful use of the orchestra as a factor in the solution of the art problem. This is no longer a mere accompaniment to the singer, but translates the passion of the play into a grand symphony, running parallel and commingling with the vocal music. Wagner, as a great master of orchestration, has had few equals since Beethoven; and he uses his power with marked effect to heighten the dramatic intensity of the action, and at the same time to convey certain meanings which can find vent only in the vague and indistinct forms of pure music. The romantic conception of the mediæval love, the shudderings and raptures of Christian revelation, have certain phases that absolute music alone can express. The orchestra, then, becomes as much an integral part of the music-drama, in its actual current movement, as the chorus or the leading performers. Placed on the stage, yet out of sight, its strains might almost be fancied the sound of the sympathetic communion of good and evil spirits, with whose presence mystics formerly claimed man was constantly surrounded. Wagner's use of the orchestra is probably best illustrated from the opera of *Lohengrin*.

The ideal background in *Lohengrin*, from which the emotions of the human actors in the drama are reflected with supernatural light, is the conception of the "Holy Graal," the mystic symbol of the Christian faith, and its descent from the skies, guarded by hosts of seraphim. This is the subject of the orchestral prelude, and never have the sweetnesses and terrors of the Christian ecstasy been more potently expressed.

The prelude opens with long-drawn chords of the violins, in the highest octaves, in the most exquisite *pianissimo*. The inner eye of the spirit discerns in this the suggestion of shapeless white clouds, hardly discernible from the aerial blue of the sky. Suddenly the strings seem to sound from the farthest distance, in continued *pianissimo*, and the melody, the Graal-motif, takes shape. Gradually, to the fancy, a group of angels seem to reveal themselves, slowly descending from the heavenly heights, and bearing in their midst the *Sangreal*. The modulations throb through the air, augmenting in richness and sweetness, till the *fortissimo* of the full orchestra reveals the sacred mystery. With this climax of spiritual ecstasy the harmonious waves gradually recede and ebb away in dying sweetness, as the angels return to their heavenly abode. This orchestral movement recurs in the opera, according to the laws of dramatic fitness, and its melody is heard also in the motif of Lohengrin, the knight of the Graal, to express certain phases of his action. The immense power which music is thus made to have in dramatic effect can easily be fancied.

A fourth prominent characteristic of Wagner's music-drama is that to develop its full splendor there must be a coöperation of all the arts, painting, sculpture, and architecture, as well as poetry and music. Therefore in realizing its effects much importance rests in the visible beauties of action, as they may be expressed by the painting of scenery and the grouping of human figures. But all Wagner's principles would have been useless without the energy and perseverance which directed his work, the loving study which stored his memory with all the great works of his predecessors, and, above all, the genius which commands the admiration of the musical world.

As a great musical poet, rather epic than dramatic in his powers, there can be no question as to Wagner's rank. The performance of the *Nibelungen* trilogy, covering *Rheingold*, *Die Walküre*, *Siegfried*, and *Götterdämmerung*, was one of the epochs of musical Germany. However deficient Wagner's skill in writing for the human voice, the power and symmetry of his conceptions, and his genius in embodying them in massive operatic forms, are such as to storm even the prejudices of his opponents. The poet-musician rightfully claimed that in his music-drama is found that wedding of two of the noblest of the arts, pregnantly suggested by Shakespeare:

> "If Music and sweet Poetry both agree,
> As they must needs, the sister and the brother;
>
> * * * * * *
>
> One God is God of both, as poets feign."

MOSES

From the painting by Carlo Dolci

RELIGION

MOSES

MOSES, the great Hebrew lawgiver and prophet, is the first gigantic figure that rises to view in the traditional history of the human race. As in the case of Homer and other great names of antiquity, great difference of opinion has existed as to the dates of his life and activities. These range all the way from the seventeenth to the seventh century B. C., but the best historians and critics now practically agree that he lived and flourished within the fourteenth and thirteenth centuries B. C.

The story of Moses is told in the book of *Exodus,* is referred to, also, in the writings of Strabo and Josephus, and, as we now know it, has been embellished much by legend. The main features, however, are on the whole consistent; and there is no reason to doubt the truthfulness of an account which shows us Moses, like many other supreme benefactors and "suns" of mankind, struggling against an apparently adverse fate from the instant of his birth.

Moses, it appears, was the son of Amram, of the tribe of Levi, and was born at the time this Hebrew tribe was settled in the northeastern part of Egypt. In consequence of an Egyptian royal edict that all male infants of the Hebrews should be drowned, his mother, unable to hide the child, put it into a basket of papyrus and hid it among the Nile rushes, Miriam, his sister, watching it from afar. The king's daughter, Thermuthis, or Merrhis, coming down to the river, observed the weeping child, and was so struck with its beauty that she allowed Miriam to fetch a Hebrew nurse, Jochebed.

When grown up, Moses was sent to the king's palace at Heliopolis as the adopted son of the princess, and here seems to have enjoyed not only princely rank, but also a princely education. He is also said to have become a priest, under the name of Osarsiph, or Tisithen, and to have been a mighty adept in all the sciences of Egypt, Assyria, and Chaldea; to have led Egyptian armies against the Ethiopians, defeated them, and pursued them to their stronghold, Saba, or Meroe, this place being delivered into his hands by Tharbis, the king's daughter, whom he subsequently married.

The Bible contains nothing whatever about the time of his youth. He first reappears there as the avenger of a Hebrew slave, ill-treated by an Egyptian overseer. Threatened by the discovery of this bloody act, he escapes into Midian, where he is hospitably received by Jethro, the priest, and marries his daughter, Zipporah. He stayed for many years in Midian, tending the flocks of his father-in-law. This most sudden transition from the brilliant and refined life of an Egyptian court, of which he had been brought up a prince, to the state of a poor, proscribed, exiled shepherd, together with the influences of the vast desert around him, produced in his mind a singular revolution. The fate of his brethren went now to his heart with greater force than when he was a prince and near them. There rushed upon his memory the ancient traditions of his family, the promises of Jehovah to the mighty sheikhs, his forefathers, that they should become a great and a free nation, and possess the ancient heritage of Canaan; why then should not he be the instrument to carry out this promise?

So Moses obeyed the prophetic spirit that now came upon him, and decided to return to Egypt for the purpose of delivering his brethren from slavery. A new king had succeeded in Egypt, his old enemies were either dead or had forgotten him, and with Aaron, his brother, the man of small energy but of fine tongue, he consulted about the first steps to be taken with the king as well as with their own people — both of whom treated them at first with suspicion, and even contempt. Presently, however, a series of most disastrous and terrifying afflictions visited Egypt, and the king finally concluded that these had been brought upon the land by the unknown God — Jehovah — whose name Moses had invoked. He accordingly ordered the Israelites to leave at once, and they immediately began their departure, the event in their history known as the exodus.

Moses very soon had occasion to prove that he was not only the God-inspired liberator of his people, who, in the enthusiasm of the moment had braved the great king and his disciplined armies, but that he possessed all those rarer qualities which alone could enable a man to mould half-brutalized hordes of slaves into a great nation. Calmness, disinterestedness, patience, perseverance, meekness, coupled with keen energy, rapidity of action, unfailing courage — "wisdom in council and boldness in war" — constituted the immense power which he held over the hundreds of thousands who knew no law in their newly acquired liberty, and who were apt to murmur and to rebel on any or no provocation. Nor were the hostile Bedouin tribes, whose territories the new emigrants approached, easily overcome with untrained warriors, such as formed the ranks of Moses's army. The jealousy of certain elders fostering seditions within added to his unceasing vexations; and, to fill the measure to overflowing, indeed, his own brother Aaron, whom he had made his representative during his temporary absence on the mount of Sinai, himself assisted in the fabrication of an idol.

His sacred office as legislator he in reality first assumed in the third month after the exodus, when, after many hard and trying marches and countermarches, made more trying by want of food and of water, by encounters with Pharaoh and the Amalekites, having arrived near the mount of Sinai, he made the people encamp all round, and ascended the summit of the mountain by himself. Shortly thereafter he disclosed to his people that famous code of laws — chief of which was the decalogue — which had such a mighty influence in succeeding time.

When on the eve of entering into the promised land, the people broke out in open rebellion, and threatened, by a spontaneous return to the land of slavery, to undo the entire work of Moses's life. Convinced that they were not as yet fit to form a commonwealth of their own, the liberator and lawgiver had to postpone, for the long space of forty years, the crowning act of his work; and in fact did not himself live to see them taking possession of the hallowed territory. How these years of nomadic journeying through the desert were spent, save in rearing up a new generation of a more manly and brave, as well as a more "civilized," stamp, we can only conjecture. All those who had left Egypt as men were doomed to die in the desert, either by a natural death, or by being suddenly "cut off," in consequence of their openly defying Moses, and through Moses, Jehovah.

On the first month of the fortieth year after the exodus, we find Moses at the head of an entirely new generation of Hebrews at Kadesh, in the desert of Phoran or Zin. Here his sister Miriam died. Here, also, for the first time, Moses, seeing the new generation as stubborn and "hard-necked" as their fathers, is recorded to have despaired of the divine providence; and his disobedience to the letter of the commandment given to him, "to speak to the rock," is alleged as the reason "that his bones, too, had to fall in the desert." His brother Aaron died at Mt. Hor (near Petra, according to Josephus and St. Gerome) whither the Israelites had gone next.

Not long afterward Moses once more had occasion to punish with relentless severity the idolatrous tendencies of the people, thus showing that age had had no power of making him relax his strong rule over the still half-savage and sensuous multitude. Having finally fixed the limits of the land to be conquered, and given the most explicit orders to Joshua, to Eleazar, and the chiefs of the ten tribes respecting its division, he prepared the people for his own impending death. He recalled to their minds in the most impressive language their miraculous liberation, and no less miraculous preservation in the desert. Their happiness — their life — was bound up, he told them, in the divine law, communicated through him by Jehovah. A recapitulation of its principal ordinances, with their several modifications and additions and reiterated exhortations to piety and virtue, forms the contents of his last speeches, which close with one of the grandest poetical hymns. The law was then handed over to the priests that they might instruct the people in it henceforth; Joshua was installed as successor, and he blessed the whole people.

Moses then ascended Mt. Nebo, from whence he cast a first and last look upon the land toward which he had pined all his life, and on which his feet were never to tread. He died upon this mountain, when one hundred twenty years old, in the full vigor of manhood, according to the scriptures, "and no man knew his burial place up to this day" — so that neither his remains nor his tomb were desecrated by "divine honors" being superstitiously paid to them.

This is a summary of Moses's life as derived from biblical as well as non-biblical sources. Of far greater import than this imperfect chronicle of facts is his influence on the human race.

In one of the churches of Rome — St. Peter in Chains — rests a colossal statue of Moses — the immortal work of Michaelangelo. The great lawgiver is represented in sitting posture holding in his right hand the tables of stone, his left touching the long beard which falls upon his breast. This statue has been called "the incomparable masterpiece of its author, and, perhaps, of modern sculpture." We can not affirm that the statue looks like Moses, but no one can stand in its presence without feeling tempted to say that it looks as Moses ought to have looked. It is the interpretation of one great genius by another great genius.

The subject of this statue, as also of Carlo Dolci's famous painting, is for us of supreme interest. In the ancient language, both of Hebrews and Christians, he was known as "the great lawgiver," "the great theologian," "the great statesman"; and in the pentateuch, or first five books of the Bible — of which he is the reputed author — we have the first attempt to formulate a written constitution for the government of a people. The Hebrews call these books the *Torah*, or the "Law." They are too well known to need special exposition. *Genesis* is the history of creation and of patriarchal life; *Exodus*, an account of the migration from Egypt and the foundation of the Hebrew law; *Leviticus* is a book of religious ceremonial regulations; *Numbers*, a book of statistics; and *Deuteronomy*, a continuation and completion of the law.

Three distinct parts compose this Mosaic constitution: the doctrine with respect to God and His attributes; the *symbolical law*, as the outward token of His doctrine; and the *moral* and *social* law. The institution of the sabbath, the symbol of creation and the Creator, forms the basis of all religious observances; while the remaining part of the laws relates to the intercourse among the members of the human commonwealth. It is these things, taken together, which form the basis of the Christian religious system of the civilized world — the highest of that class known to scholars under the name of monotheism. We find in apocryphal works an explanation of how Abraham first came to worship, in the midst of idolaters, the one, invisible God; how he first lifted up his eyes, and saw a brilliant star, and said, "This is God"; but when the star paled before the brightness of the moon, he said, "This is God." And then the sun rose, and Abraham saw God in the golden glory of the sun. But the sun, too, set, and Abraham said, "Then none of you is God, but there is one above you, who created both you and me. Him alone will I worship, the maker of heaven and earth." Such is the possible origin of monotheism. In the "Confessions" of St. Augustine will be found a similar idea.

In the first of the sacred writings, *Genesis*, the author appears as the philosopher or theosophist; in the great ethical and civil code known as the "Law," he is the teacher and moralist. But he may also be considered from another point of view. He established a government — a government different from that of Rome or Greece — one of that kind to which Josephus was the first to give the name of theocracy, a government under the control of deity.

Of the cosmogony of *Genesis* — that is, the theory of the origin of the world — it is necessary to say but little. It has been impeached, and it has been defended. Of all the like theories ever attempted, this is the only one which will bear a second reading — the only one which is temperate and decorous. All others contain such admixtures of the monstrous and the grotesque as to seem, by comparison, simply incoherent.

A few words will suffice to explain what is meant by the "Law," as the Hebrews, and after them other nations, understood it. Suppose one should define and write down all the relations, public and private, which unite the members of a people, and, in addition to these, all the principles upon which these relations are founded. The result would be an *ensemble*, a complete body, a system, more or less rational, which would be the perfect expression of the mode of existence of that people. It is such a system as this to which the Hebrews gave the name of *Torah*, the "Law," or the "Constitution."

This body, the "Law," is made up of several parts containing distinct propositions. Some establish the general relations of the citizen, others are laws in the more limited sense. Some command or forbid certain things, attach a penalty for disobedience, and show the guilty the punishment which the nation will inflict or cause to be inflicted for the sake of the safety of its members. Others, still, prescribe simple measures for the regulation of affairs, while, finally, others under the name of precepts trace out the duties to be performed, and show the general evil, which, in the natural order of things, ever accompanies infidelity to the principle of the supreme good.

"If the lawgiver, educated in all the wisdom of the Egyptians, departed most widely from the spirit of Egyptian polytheism in the fundamental principle of his religious institutes," says Milman, "the political basis of his state was not less opposite to that established in the kingdom of the Pharaohs. He was the first, and certainly the most successful legislator of antiquity, who assumed the welfare of the whole community as the end of his constitution."

With the Hebrews there were none of those disastrous distinctions of caste established among the Egyptians; nothing of that spirit of disdain in one order for those in another order; neither those barbaric laws, concentrating in a favored portion of the nation all knowledge and all authority. With the people of Jehovah everything tended toward a natural equality; the whole nation was one great caste, that of husbandmen, cultivating their own property.

The social system of Moses was a democracy, based upon the notion of duty. He proclaimed the equality of men before the law, the sense of duty the sole origin of law, no such thing as justice, no equality being possible without it. The perfect equality, then, in the sight of their God, the Eternal, seems to be the mark by which the Hebrew theocracy was distinguished, strangely resembling in many respects its modern Puritan ideal of an industrial commonwealth.

The sanction on which Hebrew morals depended was, if possible, even more extraordinary. The lawgiver, educated in Egypt, where the immortality of the soul, under some form, most likely that of metempsychosis, or the transmigration of the soul, entered into the popular belief, nevertheless maintained a profound silence on that fundamental doctrine, if not of political, at least of religious legislation — the rewards and punishments of another life. He substituted temporal chastisement and temporal blessings. On the violation of the constitution followed inevitably blighted harvests, famine, pestilence, barrenness among their women, defeat, captivity; on its maintenance, abundance, health, fruitfulness, victory, independence.

In this respect it presents a contrast to the great organization which succeeded it, the modern Christian church. This distinction has been clearly defined; and "we often see," in the language of Fleury, "the life of those whose thought and occupation is not of earth, but in heaven, and who, while still in the flesh, yet live according to the spirit. In the manners of the Hebrews, on the other hand, we see the best use of temporal goods, and the aim to pass in the way the most rational the life spent upon earth."

We come finally to consider the crowning glory of all the work of Moses, the decalogue. The principles embraced by the ten commandments may be reduced to three:

1. The duty of man never to accord to his fellow beings, or to any other creatures, that kind of homage which belongs alone to the deity.

2. The right of the people to assemble in meeting every seventh day, in the interest of the laws and of the prosperity of the country; the duty of each citizen to divide his time and his thought between civil and religious interests in proportion, at the least, of one of six.

3. The duty of respect to persons and to property, the right of each to be himself respected.

It is not in the twentieth chapter of *Exodus* alone that we find the law; there is a chapter in *Leviticus*, the nineteenth, which contains the same doctrine, though in a less impressive form. This is but the simplest and plainest expression of what are to-day acknowledged to be the first principles of good morals.

What was the substance of the ten commandments? What has the human race gained by its adoption of what Burckhardt called "the code of the Beni-Israel"? "It is, in one word," says Dean Stanley, "the declaration of the indivisible unity of morality with religion. It was the boast of Josephus that whereas other legislators had made religion to be a part of virtue, Moses had made virtue to be a part of religion. Of this, amongst all other indications, the ten commandments are the most remarkable and enduring example."

The personal characteristics of Moses are too faintly drawn to admit of very full delineation; but several features are indisputably marked out. He combined in himself two qualities rarely found together in the same man: he was hero as well as legislator. He found a people in bondage, and he led them out of it and left them free.

It has sometimes been attempted to reduce this great character into a mere passive instrument of the divine will, as though he had himself borne no conscious part in the actions in which he figures, or the messages which he delivers. This, however, is as incompatible with the general tenor of the scriptural account as it is with the common language in which he has been described by the church in all ages. The frequent addresses of the divinity to him no more contravene his personal activity and intelligence than in the case of Elijah, Isaiah, or St. Paul. In the new testament the legislation of the Jews is expressly ascribed to him: "Moses gave you circumcision"; "Moses, because of the hardness of your hearts, suffered you"; "Did not Moses give you the law?" "Moses accuseth you." St. Paul goes so far as to speak of him as the founder of the Jewish religion: "They were all baptized unto Moses." And he is constantly called "a prophet."

"No modern word," says Dean Stanley, "seems exactly to correspond to that which our translators have rendered, 'the meekest of men'; but which rather expresses 'enduring,' 'afflicted,' 'heedless of self.' This, at any rate, is the trait most strongly impressed on all his actions from first to last. So in Egypt he threw himself into the thankless cause of his oppressed brethren; at Sinai he besought that his name might be blotted out, if only his people might be spared; in the desert he wished that not only he, but all the Lord's people might prophesy. He founded no dynasty; his own sons were left in deep obscurity; his successor was taken from the rival tribe of Ephraim. He himself receives for once the regal title 'the king in Jerusalem'; but the title dies with him. It is as the highest type and concentration of this endurance and self-abnegation that the last view from Pisgah receives its chief instruction. To labor and not to see the end of our labors; to sow, and not to reap; to be removed from this earthly scene before our work has been appreciated, and when it will be carried on, not by ourselves, but by others, is a law so common in the highest characters of history, that none can be said to be altogether exempt from its operation.

"Never was there an undertaking more arduous than that on which he was commissioned. To lead forth a mob of slaves, debased as only slavery can debase humanity, sunk below the dead level of pagan Egyptian civilization; to form them into a daring army, a free commonwealth, and a believing church; to be exposed to all the ready and violent vicissitudes of their desires and hopes and fears, and so to have to suffer their manners in the wilderness; to have them upbraid him for their very deliverance when their sensual natures lusted after the fleshpots of Egypt; to have them talk of stoning him when the wells were dry; to have them dispute with him for his command, and rebel against his rule; to have them break their covenant with Jehovah, and turn to the sacred calf of their old Egyptian oppressors — all this was such a burden as was never laid on any other.

"Each of the two former selections of his life gave its own contribution to the last, with its glorious time of harvest and achievement. He who was to be victor over Pharaoh, and the emancipator of the Israelites, was trained in the very military school which he was to oppose. Humanely speaking, he could never have so dealt with Pharaoh if he had not enjoyed his Egyptian advantages. As William the Silent was educated in the closet of Charles V., and at the court of Philip II., into the liberator of the united provinces, and thus turned to account, in the emancipation of his fellow countrymen, the lessons in diplomacy and military tactics which he had learned from the oppressor himself, so Moses, under God, made his learning in all the wisdom of the Egyptians subservient to the great work of his life. Nay, as he was to stand before the nations the grand champion for spiritual monotheism, in the face of idolatry, materialism, and polytheism, he was first initiated in the system which he was to oppose. Just as Saul of Tarsus was prepared by his education in the school of Gamaliel for understanding the real symbolism of Judaism, and thereby advancing the simplicity and spirituality of the gospel — so Moses was enabled by his Egyptian learning to penetrate to the heart of the religious symbolism of his time. Thus, at length, he became the instrument of producing an external system in which the eye was made to minister to the understanding, while yet there was no sculptured image of Jehovah to ally it with the idolatries of the nations."

In spite of all the daring criticism that has been proposed concerning the personality and work of Moses, history shows few, if any, men of his towering grandeur.

ZOROASTER

Oh Persic Zoroaster, lord of stars!
— Who said these old renowns, dead long ago,
Could make me overlook the living world
To gaze through gloom at where they stood, indeed.
— *Browning.*

ZOROASTER is the Latinized name of ZARATHUSTRA, the founder of the Persian-Iranian religion, usually designated Zoroastrianism, of which the Magian and Parsee religions are forms. A wide range of dates is assigned to the activities of Zoroaster, but modern scholars usually accredit him to the seventh and sixth centuries B. C. Roth, an eminent scholar, puts his date about 1000 B. C., while others have placed him as far back as 1500 B. C.

Special significance attaches to Zoroaster and the religion he founded, because Persia is, in a certain sense, the elder brother of the Aryan family, first of the Indo-European peoples. Indeed, the prominence of the Indo-European races — from which we are descended — in the great drama of universal history commences with the era of the early Persian empire.

The personal history of Zoroaster is known only in outline. In the *Zend-Avesta* — the authorship of which is generally accredited to him — he appears under his family name of Spitama, the inference being that Zarathustra was a title, or sobriquet, meaning "chief," "senior," or "high priest," which were common designations for a spiritual guide and head of a province. The terms he applied to himself are: Manthran, a reciter of manthras; a messenger sent by Ormuzd; a speaker; one who listens to the voice of oracles given by the spirit of nature; one who receives sacred words from Ormuzd through the flames.

He seems to have been born in Bactria, in the northwestern part of Iran, and was the son of Pourushaspa. His doctrine then spread to Media, and Persia proper. Various cities are mentioned as his birthplace, and the ancient town of Rei, near the modern Teheran, is said to have been the original home of his mother, Dugheda. Many legends and a number of miracles gathered about his birth and childhood, and tradition leaves space for a period of religious preparation from his fifteenth to his thirtieth year, when he received a revelation of the faith and came forward as a reformer of the superstitious beliefs of the old Brahmanic creed.

He evidently traveled over a considerable part of Iran, for mention is made of his presence at various places; and he was doubtless, also, the leader of a group of chieftains — one of whom was King Vishtaspa — who carried on a political, military, and religious struggle for the establishment of a holy agricultural state, whose laws encouraged pastoral labor, tillage, and thrift, as against the freebooting tendencies of Turanian and Vedic aggressors. That he was legislator, prophet, pontiff, and philosopher, as tradition asserts, is quite within the bounds of truth; but that he was the "abyss of all wisdom and truth, and the master of the whole living creation" must be taken as a mere oriental extravagance, though at the same time it shows the place Zoroaster occupied in Persian thought.

"We worship" — so runs one of the prayers in Fravardin Yasht — "the rule and the guardian angel of Zarathustra Spitama, who first thought good thoughts, who first spoke good words, who first performed good actions, who was the first priest, the first warrior, the first cultivator of soil, the first prophet, the first who was inspired, the first who has given to mankind nature, and reality, and word, and hearing of word, and wealth, and all good things created by Mazda, which embellish reality; who first caused the wheel to turn among gods and men, who first praised the purity of the living creation and destroyed idolatry, who confessed the Zarathustrian belief in Ormuzd, the religion of the living God against the devils. * * * Through whom the whole true and revealed word was heard, which is the life and guidance of the world. * * * Through his knowledge and speech, the waters and trees become desirous of growing; through his knowledge and speech, all beings created by the Holy Spirit are uttering words of happiness."

The conflict that led to this schism between the Iranians and those Aryan tribes which immigrated into Hindustan proper, and whose leaders afterward became founders of Brahmanism, sprung from many social, political, and religious causes. The Aryans seem to have originally led a nomad life, until some of them, reaching, in the course of their migrations, lands fit for permanent settlements, settled down into agriculturists. Bactria and the parts between the Oxus and Jaxartes seem to have attracted them most. The Iranians became gradually estranged from their brother tribes, who adhered to their ancient nomad life; and by degrees, the whilom affection having turned into hatred, they considered those peaceful settlements a fit prey for their depredations and inroads. The hatred thus nourished by further degrees included all and everything belonging to these devastators; even their religion, originally identical with that of the settlers. The *deva* religion became in their eyes the source of all evil. Moulded into a new form, styled the Ahura religion, the old elements were much more changed than was the case when Judaism became Christianity. Generation after generation further added and took away, until Zarathustra, with the energy and the clear eye that belongs to exalted leaders and founders of religions, gave to that which had originally been a mere reaction and spite against the primitive Brahmanic faith, a new and independent life, and forever fixed its dogmas, not a few of which have sprung from his own brains.

The propagation of his religious system occupied Zoroaster down to the time of his death, which tradition has fixed at the end of seventy-seven years. His end seems to have been a violent one, and to have taken place during the invasion of Iran by the Turanians who waged a religious war against Vishtaspa. Firdausi and other later writers locate the place of his death as Balkh, or Bactria.

The present *Avesta*, or *Zend-Avesta* — the bible of Zoroastrianism — is only the remnant of a greater religious literature. It includes: (1) A collection of hymns or gathas; (2) a collection of liturgical forms; (3) a collection of religious laws; (4) mythical fragments devoted to various divinities; and (5) various prayers and fragments. The gathas, or hymns, are verses from the sermons of Zoroaster, and they form the oldest and most sacred part of the *Avesta*. The vendidad, or religious laws, is similar to the pentateuch of Moses, and is chiefly directed against the *devas*, or demons.

It is chiefly from the gathas that Zarathustra's real theology, unmutilated by later ages, can be learned. These are written in the language of ancient Persia, and profess to give the revelations made by Ormuzd to his servant and prophet Zarathustra. His system teaches that the world or universe is the scene of a conflict between two principles — the good, called Ormuzd, and the evil, called Ahriman — the god of life and the god of death. Every good action helped the one, every evil action the other. The soul of man, the soil of every field, were scenes of never-ending battle. Those who touched what was impure gave Ahriman the more power over them.

"Ormuzd was glorious with light," he says in the gathas, "pure, fragrant, beneficient, daring, all that is pure. Then looking beneath him he perceived, at the distance of ninety-six thousand parasangs, Ahriman, who was black, covered with mud and rottenness, and doing evil. Ormuzd was astonished at the frightful air of his enemy. He thought within himself, 'I must cause the enemy to disappear from the midst of things.'"

The great dualism of good and evil, which is his fundamental idea, does not stop, however, at the single generality; it creates a hierarchy extending to all created things, animate and inanimate, men, animals, insects, vegetables; all of which, according as they are pure or impure, attach themselves to God the prince of good, or to satan the prince of evil. Fire and light progressively diminish in intensity; where heat and light cease, matter commences, with darkness and evil, which we must attribute to Ahriman, not to Ormuzd. A countless host of inferior angels and demons are distributed through the two kingdoms, which are in eternal war with each other. But Ahriman and the power of darkness will in time be vanquished, and over all the universe will extend the reign of light.

"This duality," says M. Haug, one of the highest authorities on the *Zend-Avesta*, "is threefold, and refers: first, to the two principal spirits; second, to the two lives, i. e., this life and the life hereafter; third, to the two wisdoms, i. e., the knowledge acquired by study and experience, and the inborn celestial wisdom."

Thus declares Zoroaster:

"I will proclaim the two primeval spirits of the world. I will proclaim the primeval thought of this life. I will proclaim the best in this life. All that have been living, and will be living, subsist by means of his bounty only. The soul of the pure attains to immortality, but that of the wicked man has to undergo everlasting punishment. Such is the rule of Ormuzd, whose creatures we are."

Each of the two primeval spirits — Ormuzd and Ahriman — are represented in the *Zend-Avesta* as having a council and court of his own, like earthly rulers. The number of councilors was six, each having to rule over some special province of creation; but Ormuzd, who at first merely presided over this council, came gradually to be included in their number, and we then read of seven instead of the usual six Ameshaspentas, or immortal saints. These six supreme councilors, who have also found their way into the Jewish tradition embodied in the Talmud, are, both by etymology and the sense of the passages into which they figure, distinctly seen to be but abstract nouns or ideas, representing the gifts which Ormuzd grants to all those who worship with a pure heart, who speak the truth, and perform good actions.

The first of these angels or principles (Vohu Mano) is the vital faculty in all living beings of the good creation. He is the son of Ormuzd, and penetrates the whole living good creation. By him are wrought all good deeds and words of men. The second (Ardibehesht) represents the blazing flame of fire, the light in luminaries, and brightness and splendor of any and every kind. He represents, as the light, the all-pervading, all-penetrating Ormuzd's omnipresence. He is the preserver of the vitality of all life and all that is good. He thus represents providence. The third presides over metals, and is the giver of wealth. His name is Sharavar, which means possession, wealth. The fourth (Issandarmat, or devotion) represents the earth. It is a symbol of the pious and obedient heart of the true worshiper, who serves Ormuzd with his body and soul. The last two (Khordad and Amerdat) preside over vegetation and produce all kinds of fruit.

But apart from the celestial council stands Sraosha (Serost, or messiah), the archangel, vested with very high powers. He alone seems to have been considered a personality. He stands between Ormuzd and man, the great teacher of the prophet himself. He shows the way to heaven, and pronounces judgment upon human action after death. He is styled "the sincere, the beautiful, the victorious, who protects our territories, the true, the master of truth." "For his splendor and beauty, for his power and victory," he is to be worshiped and invoked. "He first sang the five gathas of Zarathustra Spitama"; that is, he is the bearer and representative of the sacred tradition, including the sacrificial rites and the prayers. He is the protector of all creation, for "he slays the demon of destruction, who prevents the growth of nature, and murders its life. He never slumbers, but is always awake. He guards with his drawn sword the whole world against the attacks of the demons, endowed with bodies after sunset. He has a palace of one thousand pillars, erected on the highest summit of the mountain Alborj. It has its own light from inside, and from outside it is decorated with stars. He walks, teaching religion round about the world." In men who do not honor him by prayer, the bad mind becomes powerful, and impregnates them with sin and crime, and they shall become utterly distressed both in this life and in the life to come.

In the same manner, Ahriman, the evil spirit, was endowed with a council, imitated from the one just mentioned, and consisting of six *devas*, or devils, headed by Ahriman himself, who is then styled Devanam Devo, "arch-devil." The first after him is called Ako Mano, or naught mind, the original "non-reality," or evil principle of Zoroaster. He produces all bad thoughts, makes man utter bad words, and commit sin. The second place is taken by the Indian god, Indra; the third, by Shiva, or Shaurva; the fourth, by Naonhaitya — the collective name of the Indian Ashuras, or Dioscuri; the fifth and sixth, by the two personifications of "darkness" and "poison." There are many *devas*, or devils, besides, to be found in the *Zend-Avesta*, mostly allegorical or symbolical names of evils of all kinds. While the heavenly council is always taking measures for promoting life, the infernal council is always endeavoring to destroy it. They endeavor to spread lies and falsehoods, and coincide, together with their great chief, with the devil and the infernal hierarchy of the new testament.

The *Zend-Avesta* also contains an account of the creation of sixteen regions by Ormuzd, together with sixteen evil ones by Ahriman, in opposition to these. Thus:

"Ormuzd spake to the holy Zoroaster: I created a place, a creation of delight; the first and best of regions and places I created. Then the Evil One, who is full of death, created an opposition to the same: a great serpent and winter. Ten months are there; two summer months. And these are cold as to the water, cold as to the earth, cold as to the trees. After this, to the middle of the earth, then to the heart of the earth, comes the winter; then comes the worst evil.

"The second and best of regions and places have I created.

"Then the Evil One, who is full of death, created an opposition to the same: a wasp, which is very death to the cattle and the fields.

"The third and best of regions and places I created.

"Then He, who is full of death, created an opposition to the same: evil thoughts.

"The fourth and best of regions and places have I created.

"Then the Evil Spirit, who is full of death, created an opposition to the same: devouring beasts."

The sixteen regions thus created give to us a most important geographical record of the countries known to the early Iranians — Balkh, Merv, Herat, Cabul, and others. The account goes on with the entire sixteen. In the fifth, sixth, seventh, and eighth regions — "the best of regions and places" — the Evil One in opposition places unbelief, slothfulness, and poverty, evil defilement, wicked inexpediable deeds, etc. The remaining eight are very similar: on the one hand, the best of regions and places, the fair and the beautiful, full of pasture grounds; on the other, wicked signs, wicked deeds, wicked tokens. The chapter closes with the words: "There are also other regions, places, plains, and lands."

Other chapters describe the work of creation, both material and spiritual. In oriental religions, the creation of spirit precedes that of matter; but otherwise the account resembles slightly that given in *Genesis*. It occupied, however, three hundred sixty-five days, or one year, divided into six periods, each of which is commemorated with a festival. The world will last twelve thousand years: the first three thousand is the reign of the good principle; the second three thousand that of the good and the bad principles together; while, at the last, the triumph of the good is assured.

The belief in the latter, and in immortality, was one of the principal dogmas of Zoroaster, and it is held by many that it was not through Persian influence that it became a Jewish and a Christian dogma. Heaven is called the "house of hymns," a place where angels praise God incessantly in song. It is also called the "best life," or paradise. "Hell" is called the house of destruction. It is the abode chiefly of the priests of the bad (*deva*) religion. The modern Persians call the former Behesht; the latter, Duzak. Between heaven and hell there is a bridge of the gatherer or judge, over which the soul of the pious passes unharmed, while the wicked is precipitated from it into hell. The resurrection of the body is clearly and emphatically indicated in the *Zend-Avesta;* and it belongs, in all probability, to Zoroaster's original doctrine — not, as has been held by some, to later times, when it was imported into his religion by other religions.

It is often asserted that men and peoples are actuated to virtuous conduct by one or more of four motives: fear, self-interest, love, and duty. It has also been said with equal force that the age of the individual, or of the society, will determine which of these motives will predominate. Infancy — whether in the individual, or the society — is specially influenced by fear; mature age, by a sense of duty. It must be confessed that Persia, ever regarded as the infant of the human race, exhibits, in its religion, the general characteristics of infancy. The sword of Ormuzd is grand and terrible; the Parsee bows his head before a jealous god; he hears his god's reprobation; prayers and sacrifices are incessant, the sacred fire must ever be supplied with wood, with oil, with perfumes.

Yet we find striking exceptions, at least in theory. The moral and economic reforms of Zoroaster must be considered of a high order; and, unlike Buddhism, a holy life is rewarded by immortality and heaven. The elements — earth, air, fire, and water, but especially fire — received homage as creations of Ormuzd. The tillage of the soil was regarded as the highest of pursuits; and it is probable that from this teaching the somewhat unorthodox Persian maxim originated: "It is better to plow than to pray."

The following are a few of the moral sayings found in the creed of Zoroaster:

"Never lie; it is infamous, even when falsehood may be useful.

"We ought not to become answerable for others, for we can hardly be answerable for ourselves.

"True happiness consists in a competence of this world's goods, health, and the approbation of a good conscience.

"He who sows the ground with care and diligence acquires a greater stock of religious merit than he could gain by the repetition of ten thousand prayers."

Virtue, finally, may be summed up in a word — the essence of all: "There are three rules of life, saith the law: purity of thought, purity of word, purity of action."

Nowhere, probably, has the work of Zoroaster been more concisely and correctly summed up than in the language of James Anthony Froude: "Zoroaster, like Moses, saw behind the physical forces into the deeper laws of right and wrong. He supposed himself to discover two antagonistic powers contending in the heart of man as well as in the outward universe — a spirit of light and a spirit of darkness, a spirit of truth, and a spirit of falsehood, a spirit life-giving and beautiful, a spirit poisonous and deadly. To one or other of these powers man was necessarily in servitude. As the followers of Ormuzd, he became enrolled in the celestial armies, whose business was to fight against sin and misery, against wrong-doing and impurity, against injustice and lies and baseness of all sorts and kinds; and every one with a soul in him to prefer good to evil was summoned to the holy wars, which would end at last after ages in the final overthrow of Ahriman. * * * The Persians caught rapidly Zoroaster's spirit. Uncorrupted by luxury, they responded eagerly to a voice which they recognized as speaking truth to them. They have been called the Puritans of the old world. Never any people, it is said, hated idolatry as they hated it, and for the simple reason that they hated lies."

CONFUCIUS

Superior, and alone, Confucius stood,
Who taught that useful science,— to be good.
— *Pope.*

CONFUCIUS is the Latinized name of the illustrious Chinese religionist and sage, Kung-fu-tse (variously spelled), whose influence has held uninterrupted sway over the Chinese people for almost two thousand five hundred years. The name really signifies "the master Kung," the latter being the family name of the sage, and "fu-tse" the denomination applied to him by his disciples. Most authorities agree in a number of details relating to his early life and subsequent career, but the reverence in which he is held by his countrymen has colored the facts with a tincture of fiction not easy to efface after such a lapse of time.

He was born, according to tradition, in the village of Ch'ueh, state of Lu — now in the province of Shantung — China, 551 B. C. His father died when Confucius was three years old. The former had been an official of some rank and a soldier of distinguished courage. At the age of seventy he married his second wife, the mother of Confucius. To her wise counsels the son owed much. At nineteen Confucius had been married, and held a position as district inspector of agriculture. He showed such unwonted zeal and honesty in fulfilling the duties of his new office that the whole district began to show its effects. "Neglected fields," says tradition, "were again cultivated, and idleness and misery gave place to labor and abundance."

His renown had already begun to spread beyond the narrow limits of his natal kingdom, when an event occurred, in his twenty-fourth year, which changed the whole course of his after life. His mother died; Confucius had already become an ardent student of the religious rites and moral doctrines of the older period in Chinese history, then fallen into disuse. He resigned his office, and lived in retirement for three years, mourning his loss, in accordance with an old custom. This act of filial piety made a strong impression upon his fellow citizens, and evidently led to the restoration of ancient funeral rites in honor of the dead; a restoration which has been more or less strictly adhered to by the Chinese nation up to the present day.

Confucius believed that the ancient usages and moral doctrines of the Chinese nation contained the germ of all social and political virtues, and he longed to establish a school, educate disciples, and publish books for the purpose of spreading his opinions, and regenerating his countrymen.

In his thirtieth year he began to put this plan into execution. His fame rapidly spread, admirers and scholars increased. He traveled over China to obtain converts to his revived moral philosophy, and to study the laws and customs of the country. His reputation having preceded him, he was well received wherever he went. His journey, he says, was "honorable, but sterile"; for, while nearly all admitted the justice of his principles, few had the courage to practice them. His school of philosophy, in fact, though it counted many influential adherents, was not fairly established until the third century after his death. On returning to his native place after his wanderings, he turned his house into a school to receive his disciples, who consisted of young men of all stations in life, but more especially men of letters, mandarins, and government officers.

About 501 B. C. Confucius was appointed governor of the state of Lu, where a marvelous reformation in the manners of the people took place. The next year saw him minister of works, and next minister of crime. He improved the condition of the people, took a special interest in the poorer classes, their taxes and the manner of collecting them, regarding the agricultural classes as the source of all riches and prosperity, and as deserving of the special cares of the legislature. The success of his system provoked the jealousy of a neighboring kingdom; intrigues were set on foot to diminish his influence, and, finally compelled to retire from office, he sought refuge in the province of Wei, where he lived in exile.

Followed by numerous disciples, however, he here continued the propagation of his moral philosophy. His wanderings were very unpropitious, however, and state after state refused to be improved. He was, in some instances, persecuted; once he was imprisoned and nearly starved. He was finally recalled to Lu, in extreme poverty, was well received, but did not reënter political life.

In his last years he is said to have put the finishing hand to his labors on the ancient writings that posterity, at least, might be instructed. He himself tells us that he reformed the music to which the ancient odes were sung, and edited the odes themselves. He died 478 B. C., in his seventy-second year, about ten years before Socrates was born. His wife and son were already dead, but a grandson has transmitted the family down to the present day.

Immediately after his death Confucius began to be venerated, and succeeding ages adorned his name with golden epithets. The finest temple in China occupies the site of his residence, while in every city, down to those of the third order, there is a temple to his honor. The 18th day of the second moon is kept sacred by the Chinese as the anniversary of his death. The statue of Confucius in the chief temple represents him as a man of tall stature, large head, and imposing presence. His descendants form a distinct class in China, the city of Kio-fu-ien, where he is buried, being inhabited chiefly by them. They have been distinguished by various honors and privileges, and are the only example of hereditary aristocracy in China.

In all that Confucius did or taught, the useful and practical, in a broad sense, formed the sole object of his labors and his thoughts. For many ages the classic literature of China has consisted exclusively of commentaries on the five canonical books which Confucius professed merely to abridge, and of four others, which were composed partly by himself and partly by his disciples, and which, together with the former, constitute the nine Chinese classics.

The five canonical books are the *Yih-king*— originally a cosmological essay, now, curiously enough, regarded as a treatise on ethics; the *Shu-king* — a history of the deliberations between the emperors Yaou and Shun, and other personages, called by Confucius the "ancient kings," and for whose maxims and actions he had the highest veneration; the *Shi-king* — a book of sacred songs, consisting of poems, the best of which every well-educated Chinaman learns by heart; the *Le-king* — the "Book of Rites," the foundation of Chinese manners, prescribing, as it does, the ceremonies to be observed in all the relationships of life, and the great cause of the unchangeableness and artificiality of Chinese habits; and the "Chun tsien"— a history by Confucius of his own times, and those which immediately preceded him. The first of the four books is the *Ta-hēo*, or "Great Study," a political work, in which every kind of government, from the domestic to the imperial, is shown to be essentially the same — viz., parental; the second is *Chung-yung*, or the "Invariable in the Mean," a book devoted to teaching men what is "the due medium," or the golden mean, to observe in their conduct; the third is the *Tun-yu*, or "Philosophical Dialogues," containing the recorded conversations of Confucius, and the best book for obtaining a correct knowledge of his character; and the fourth is the *Hitse*, written by Meng-tse or Mencius, who died 317 B. C., and who was by far the greatest of the early Confucians. The main object of this work is to inculcate philanthropic government.

These are the basis of Confucianism, and, rightly considered, are the most faithful expression of the Chinese mind, although it is not the oldest of the extant Chinese religions. It is, however, the cornerstone of Chinese civilization. It is often said that Confucianism is a system of morality without religion, because it is simply a system of social and political life built upon a slight foundation of philosophy.

The direct teaching of Confucius is to be found in the treatise compiled by his immediate disciples, in three books, and called the *Shu*. The first teaches the art of governing the people with wisdom; the second, how to avoid extremes in life by the aid of knowledge and virtue; the third, "The Great Learning," is a series of dialogues between Confucius and his disciples on moral and social subjects. His system is not avowedly speculative, but practical. It contains no trace of a personal God, makes no pretense of explaining the origin of things, but aims to teach social economy, chiefly by moral precepts. The mythical, miraculous, and ideal have no place in his philosophy; it is simple rationalism, founding progress on an increase of population, and improvement in national well-being. No founder of any religion can boast of greater success than Confucius, yet, strictly speaking, he did not originate a religious creed; he built up a moral philosophy based on the material wants and tendencies of the human race, making all real advance to consist in self-knowledge. He lauds the present world; rather doubts, than otherwise, the existence of a future one; and calls upon all to cultivate such virtues as are seemly in citizens — industry, modesty, sobriety, gravity, decorum, and thoughtfulness. He also counsels men to take part in whatever religious services have been established from of old. "There may be some meaning in them, and they may affect your welfare in a way you do not know of. As for the genii and spirits, sacrifice to them; I have nothing to tell regarding them, whether they exist or not; but their worship is part of an august and awful ceremonial, which a wise man will not neglect or despise." "Vast and deep," he said, "are the subtle powers of heaven and earth; they are one with the substance of things and can not be separated. There are oceans of subtle intelligence above and about us on every side."

Confucius finds evil and good, wisdom and folly, in the hearts of men. He cannot help making this distinction; some things are bad, others good; such is the oracular utterance of his conscience, which he terms "the light of intelligence." He does not, however, advance a step further, and make this moral conviction the basis of a religion. His "good" has no connection with any God. It exists; we are forced to recognize it as such; that is all we can know. Cultivate it. Those great laws of nature about which we know nothing except that they are realities, are on its side. Do not foster what you know to be mean and unworthy, for "he who offends against heaven has no one to whom he can pray." "Imperial heaven will only assist virtue."

From this standpoint Confucius taught a simple and comprehensive rule of life, both private and public. First, let every man govern himself according to the sacred maxims; then his family according to the same; and, finally, let him render to the emperor, who is the father of his people, such filial obedience as he demands of his own children, and worship him with the same veneration as he does his own ancestors; for thus will domestic peace, social order, and the safety of the commonwealth be preserved. To further this end (and in accordance with his belief that by instruction in the sacred precepts everything desirable could be accomplished), Confucius inculcated the necessity of universal education, and, in consequence, schools are diffused throughout the length and breadth of the empire, penetrating even to the remotest villages, where the maxims of the philosopher are taught, whose influence is thus perpetuated from generation to generation.

His crowning achievement as a moral teacher was his formulation of the golden rule, "What you do not wish done to yourself, do not do to others," and his injunction, "Have an upright heart; love thy neighbor as thyself."

So domestic is the religion of the Chinese, as taught by Confucius, that their ancestral rites are simply an extension of their home associations; and this is so affected that the grave has lost its terror, and the tomb is dedicated to joy. The symbolic tablet brings closer intimacy with the unseen than the grave. The ancestral temple is the center of family union, without distinction of rank or wealth; the ancestral hall is the open conscience of the people, where duties are laid bare. Here is the family sanctuary; here the youth assumes his virile cap; here marriages are celebrated, and betrothals are announced.

The forms of tablet for father and mother do not differ. This filial piety of the living would fain establish a real union with the dead. Such invocations as the following are common: "Thy body is laid in the grave, but thy spirit dwells in this temple of our home. We beseech thee, honored one, to free thyself from thy former body, and abide in this tablet henceforth and forever."

"So far as we can see," says James Freeman Clarke, "it is the influence of Confucius which has maintained, though probably not originated, in China that profound reverence for parents, that strong family affection, that love of order, that regard to knowledge and deference for literary men, which are fundamental principles underlying all the Chinese institutions. His minute and practical system of morals studied as it is by all the learned, and constituting the sum of knowledge and the principle of government in China, has exerted and exerts an influence on that innumerable people which it is impossible to estimate, but which makes us admire the power which can emanate from a single soul.

"To exert such an influence requires greatness. If the tree is to be known by its fruits, Confucius must have been one of the masterminds of our race."

BUDDHA

In the rest of Nirvana all sorrows surcease:
Only Buddha can guide to that city of Peace
Whose inhabitants have the eternal release.
— *W. R. Alger.*

BUDDHA is the title of the Hindu sage, GAUTAMA, or SIDDHARTHA, the founder of Buddhism. The term signifies "the wise, the enlightened," and is applied in the East as an analogue of our word "saint"; that is, to a class of persons who lived saintly lives, undergoing the severest penances, penetrating by divine contemplation to the highest truth, teaching to their fellows the law by which men can be saved, and who arrived at last at what is regarded by Buddhists as the highest goal — nirvana, heaven, rest, eternal sleep.

Oriental scholars now generally concur in fixing the time of the great Buddha in the sixth century B. C. His history is overlaid with a mass of extravagant legend, and the doubt has even been raised as to whether he was an actual historical personage, and not rather an allegorical figment. But there is little question now that he was the actual personal founder of the religion that bears his name.

The accepted history of Buddha is that he was the son of a king who voluntarily became an ascetic. His father was Suddhodana, king of Kapilavastu, which is placed somewhere on the confines of Oude and Nepaul. He is often called Sakya, which was the name of the family, and also Gautama, the name of the great "solar" race of which the family was a branch. The name Sakya often becomes Sakya-muni, in allusion to the solitary habits assumed by the prince.

The prince Siddhartha gave early indications of a contemplative, ascetic disposition; and his father, fearing lest he should desert his high station as Kshatriya and ruler, and take to a religious life, had him early married to a charming princess, and surrounded with all the splendor and dissipation of a luxurious court. Twelve years spent in this environment only deepened the conviction that all that life could offer was vanity and vexation of spirit. He constantly brooded over the thought that old age, withered and joyless, was fast approaching; that loathsome or racking sickness might at any moment seize him; that death would at all events soon cut off all present sources of enjoyment, and usher in a new cycle of unknown trials and suffering.

These images hung like Damocles' sword over every proposed feast of pleasure, and made enjoyment impossible. He therefore resolved to try whether a life of austerity would not lead to peace; and, although his father sought to detain him by placing guards on every outlet of the palace, he escaped, and began the life of a religious mendicant when about thirty years old. To mark his breaking off all secular ties, he cut off the long locks that were the sign of his high caste; and commenced by studying all that the Brahmans could teach him. He found their doctrine unsatisfactory, and turned ascetic. Six years of rigorous asceticism were equally vain; and, resolving to return to a more genial life, he was deserted by his disciples, and then underwent a fierce temptation from the demon of wickedness. But no discouragement or opposition could divert him from the search after deliverance. He resolved to conquer the secret by sheer force of thinking. He sat for weeks plunged in abstraction, revolving the causes of things. If we were not born, he reflects, we should not be subject to old age, misery, and death; therefore, the cause of these evils is birth. But whence comes birth or continued existence? Through a long chain of intermediate causes, he arrived at the conclusion that ignorance is the ultimate cause of existence; and, therefore, with the removal of ignorance, existence and all its anxieties and miseries would be cut off at their source. Passing through successive stages of contemplation, he realized this in his own person, and attained the perfect wisdom of the Buddha.

The scene of this final triumph received the name of Bodhimanda (the seat of intelligence), and the tree under which he sat was called Bodhidruma (the tree of intelligence), whence the Bo-tree. Throughout a whole day he remained under the Bo-tree wrestling with despair and doubt. At last the light of hope and certainty broke in upon him, as he perceived that in self-conquest and universal loving kindness lay the true path of salvation from suffering. That instant he consciously became Buddha — "enlightened." The Buddhists believe the spot to be the center of the earth.

Having arrived at the knowledge of the causes of misery, and of the means by which these causes are to be counteracted, the Buddha was now ready to lead others on the road to salvation. It was at Benares that he first preached, or, in the consequential phrase, "turned the wheel of the law"; but the most important of his early converts was Bimbisara, the sovereign of Magadha (Behar), whose dynasty continued for many centuries to patronize the new faith. During the forty years that he continued to preach his strange gospel, he appears to have traversed a great part of northern India, combating the Brahmas, and everywhere making numerous converts. He died at Kusinagara (in Oude), at the age of eighty, and, his body being burned, the relics were distributed among a number of contending claimants, and monumental tumuli were erected to preserve them.

Twelve hundred years after the Buddha's death, Hiouen-Thsang, the Chinese pilgrim, found the Bodhidruma — or a tree that passed for it — still standing. Although the religion of Buddha is extinct in the neighborhood, there are, about five miles from Gaya proper, in Behar, extensive ruins and an old dagoba, or a temple, which are believed to mark the place.

Such are the generally accepted facts relative to Buddha's life. According to tradition, "a likeness accurate to the life was done by one of his disciples in sandal wood, and served as a model for all statues and portraits of him in the North." But the truth probably is that later Hindu artists simply evolved a certain ideal likeness that — as in the case of Jesus — has become accepted as his. The peculiarity to be noted about it is the emphasis of feminine rather than masculine features.

"He has the twenty-four marks of beauty," says the native description; "his hair was curly and of deep black, the forehead broad and smooth, the eyelashes like those of a heifer, the eyes of jet black. His eyebrows were arched like the rainbow, his eyes ribbed like the leaf of the lotus, a perfect nose, regular cheeks, beautiful hands and feet," and so on. All the later images agree in the soft feminine forms; there is an air of great serenity, something of the sphinx in the expression, while the monstrous appendages in the ears reveal the idol. Many of the Buddhas bear a strange resemblance to the Venus of the Greeks.

When Buddha appeared, he signaled a crisis in the history of the East. The Hindu state had reached its apogee, and was ready for the revolution which began its decline. This revolution was a change from aristocratic sentiment and religion to democratic sentiment and religion. Brahmanism was the religion of the Brahman twice-born castes; Buddhism was the religion of all. Two thousand years before Francis d'Assisi, Buddha established the mendicant order. Absolute poverty, perpetual celibacy, a total renunciation of the things of this world, a life in monasteries, such was the foundation which he laid.

When he took up his mission, India was cut up into a multitude of little kingdoms reduced to poverty by a series of petty wars between adjoining states. Each community was still further subdivided by its social laws and occupations into rigid class-distinctions. The people, with nothing to hope for in this life, sought consolation in the superstitious doctrine of the transmigration of souls, being completely under the dominion of their priests, who taught them to prepare for a happier state of existence in some other form by a system of liberal payments to the priesthood during this life.

The disciples of Buddha, well trained and organized, continued his work. The doctrine and rules of discipline were settled in general councils. The first was held soon after his death; the second about a century later; the third, and most important, about 250 B. C., in the reign of Asoka. This monarch was the Constantine of Buddhism, and sent out missionaries in all directions. His own son carried the new teaching into Ceylon, where, after having been for ten generations handed down orally, it was for the first time committed to writing in the three great collections known as the "Tripitakas," containing, respectively, the rules of discipline of the order, moral discourses for the laity, and philosophical disquisitions.

From Ceylon, Burma was converted in the fifth century, and Siam nearly two centuries later. These are the countries where the southern or purer form of Buddhism prevails. But its most extensive conquests were made toward the north. By the beginning of the Christian era, it had become the religion of the northwesterly parts of India; and under the patronage of Kanishka, king of Kashmir, it spread into Afghanistan, Tartary, the Panjab, Sindh, Guzarat, and Rajputana. It was adopted in China in 62 A. D. by one of the Han emperors, and rapidly spread throughout that populous realm. Under the next great dynasty, the Tang (618–905), the sutras and commentaries were translated into Chinese. From China the religion passed to Korea at the close of the fourth century, and from Korea over to Japan in the middle of the sixth.

In China it was never able to supersede the ancient astrolatry, though, since the thirteenth century, it has profoundly stimulated and influenced philosophical speculation. And it still combines with the Confucianism and Tao-ism of those populations. In Japan it soon absorbed, and has now practically superseded, the indigenous fetichism. The most abnormal form of northern Buddhism was developed in Tibet. Introduced in the seventh century, it was there soon mixed up with the native devil-worship and belief in magic. Perversion of doctrine kept pace with the change of the order into a regular priesthood, whose rich endowments and compact organization made them formidable rivals of the government; until, in 1419, the Dalai Lama, the incarnate representative of deity, became sole temporal sovereign as well as head of the church.

In India itself Buddhism declined steadily after the sixth century. In the twelfth, the Mohammedan invasion swept away what remnants of it, in Kashmir and Orissa, victorious Brahmanism had spared.

Buddhism was not so much a revolution in existing beliefs as a new departure from the method following them. Breaking away from established usage, Buddha proclaimed a universal brotherhood, one that in theory permitted distinctions of caste, but in practice assumed the absolute equality of all men. Salvation came to all through self-denial and charity. It was this doctrine of equality which gave Buddhism so strong a hold on the caste-ridden people of India. Under the Brahmans it was the priest who was the active agent in preparing the way for a happier state. Buddha proclaimed that every man's salvation depended on himself. Purity of conduct, faithfully and persistently practiced, was sufficient to raise every one to the highest stage of bliss — the nirvana.

The three main theories of Buddhism are: the transmigration of souls, common to Brahmanism; the doctrine of nirvana; and the chain of cause and effect. Everything material is subject to dissolution, and the only escape from this changeability of matter is to free the soul from the passions and frailties of the body, by severe self-denial and the constant practice of charity in the widest sense toward all men and animals. So long as any leaven of the old wicked nature remains, the soul is shifted about by transmigration from one state of being to another, and cannot escape material existence in some form, a degraded being or an animal; but when the evil has been wholly purged out by a long course of self-denial, the soul is set free from all union with the material world, and assumes the condition of unchangeability that may almost be described as non-existence. The term which expresses this state — nirvana — means the annihilation of all thought and feeling, a state of eternal rest. The root word *nir* connotes negation, and *va* "to breathe," so that the term nirvana signifies to be blown out like a candle, or lifelessness.

The Buddhist heaven is, in fact, divided into several regions, rising one above the other, each more ethereal: (1) Space unlimited, where life endures twenty thousand ages; (2) that of wisdom unlimited, where life lasts forty thousand ages; (3) that where there is absolutely nothing — life here lasts sixty thousand ages; (4) that where there is neither thought nor non-thought, nothing without even the knowledge that there is nothing; life endures eighty thousand ages, and beyond this, nirvana, pure nothing — extinction completed. This scale of regions indicates the progressive purification required to attain the end. "Buddha himself was so penetrated and overcome with the feeling of the infinite, that he was lost to a sense of the world of the seen. 'All is perishable, all is miserable, all is void,' are the words continually on his lips."

The cause or antecedent of the two great evils of the world — old age and death — is found to be, in Buddhism, in birth itself. The cause of birth is previous existence, the cause of previous existence is attachment, and of this attachment, thirst, and this is traced to sensation, and sensation is the result of the six senses. What is the cause of the six senses? Name and form, namarupa. And the cause of namarupa? Consciousness. And the cause of this? Concepts, imagination, the mirror, illusion. And the cause of illusion? Primitive ignorance, the root of all — the original link from which is forged the entire chain.

Its creed is summed up in a formula called the "four great truths": First, misery always accompanies existence; second, all modes of existence, whether of men or animals, in earth or heaven, are the result of passion or desire; third, there is no escape from existence except the destruction of desire; fourth, this can be done by following the four paths which lead to nirvana. The first path, or stage, is the awakening of the soul to the truth that pain and sorrow belong to all existence. In the second stage the penitent purifies himself from all vicious desires, revengeful feelings, and delusion. In the third he becomes free from all evil passions, of ignorance, doubt, heresy, vexation, and unkindliness; and in the fourth he reaches the highest stage, where the soul is free from earthly desires and passions — a stage above purity, justice, and even faith itself, described by Buddha as the condition of universal charity. Nirvana is now within the grasp of the saintly penitent, and after this short life on earth he becomes free from all material existence, and enters the final state of rest — nirvana.

The following are its general precepts, or rules of living: (1) One should not destroy life. (2) One should not steal. (3) One should abstain from impurity. (4) One should not lie. (5) One should abstain from intoxicating drinks. (6) One should not eat at forbidden times. (7) One should abstain from dancing, singing, music, and stage plays. (8) One should not use garlands, scents, or ornaments. (9) One should not use a high or broad bed. (10) One should not receive gold or silver.

These are the Buddhist ten commandments. The first five, prohibitions to kill, steal, commit adultery, tell falsehoods, and drink, apply to all Buddhists, while the last five, the austerities, to eat no animal food, or, after midday, to abstain from use of ornaments, money, a bed, and the enjoyments of dancing, apply only to those who take the vows of a religious life. A saint was allowed to possess but eight things — three cloths, serving as a garment, a girdle, a begging bowl, a strainer, needle, and razor.

The cardinal virtues, according to this system, are six — charity and purity, patience and courage, contemplation and knowledge. The vices are pride, sensuality, hatred, doubt, love of life on earth, desire for life in heaven. Its duties are: those of parents to children—to train them in virtue, have them taught the arts and sciences, provide them with wives and husbands, give them their inheritance. Those of children to parents: to guard their property, support them in old age, honor their memory. Those of husband to wife: to treat her with kindness, be faithful, cause her to be honored by others, give her suitable ornaments and clothes. Those of wife to husband: to be hospitable to his friends, be chaste, be a thrifty housekeeper. Those toward friends and companions: promoting their interests, giving them presents, treating them as equals. Their duties in return: adhesion in misfortune, offering a refuge in time of danger, guarding property, showing kindness to family. Liberality, courtesy, kindliness, unselfishness, this is the "lynch-pin of the moral chariot."

The chief discipline of Buddhism, by which the most perfect happiness possible is attainable, is regarded as contemplation or ecstasy, the different stages of which are thus defined: The first stage is an inward sense of happiness, born in the soul of the ascetic, when he suddenly finds within him the power to distinguish the profound nature of things; he judges and reasons still, but is freed from conditions of sin. The contemplation of nirvana, for which he longs, throws him into an ecstasy which permits him to ascend to the second stage. Here his purity and freedom from vice remain the same, but judgment and reason are set aside, and his intelligence, now freed and fixed on nirvana, experiences interior satisfaction without judging or comprehending it. At the third stage even the pleasure and satisfaction disappear, a vague sense of physical well-being supervenes, the pleasure of previous happiness is indifferent, memory still remains, and a confused consciousness, notwithstanding the detachment, nearly absolute, to which he has attained. In the fourth and final stage, the ascetic no longer feels this sense of well-being, for all feeling sense, knowledge, memory, and consciousness are gone; he has arrived at perfect impassibility, the nearest approach on earth to the state of the blessed.

In addition to his character of the saint, we also have Buddha in the character of the sage. Like the wise men of Greece, he has told us of some of the most difficult things in the world: to be poor, and yet to be charitable; to be rich and great, yet to be religious; to lust, and yet banish desire; to escape destiny; to be strong without being rash; to see an agreeable object without seeking to obtain it; to bear an insult without anger; to be good, and at the same time to be learned and clever.

Buddhism also embraces a cosmology and a psychology of remarkable subtlety and consistency. As a whole it is more of a philosophy than of a theology. Yet it is the religion which, modified and combined with other systems, has perhaps found most acceptance among men outside of Christianity. Hundreds of millions of orientals find in it not only intellectual light, but spiritual sustenance and lofty moral guidance. It springs from a higher stratum of thought than the sky-worship of the Chinese, the polytheism of Greece and Rome, or even the monotheism of Moses and Mohammed.

It holds within it, however, the seeds of its own decay, in its absolute standpoint, its pessimistic bias, its metaphysical notion of merit or karma, as the germinal cause of moral rebirths, and, above all, in omitting from its purview the social organism, and its consequent inability to direct aright the active powers of man. Herein its fundamental inferiority to Christianity must be recognized. In the latter, the belief in a Supreme Being, infinite in power and love, whose paternal care extends to the very humblest of His creatures, is infinitely more satisfactory than the former without a God, and with its doctrine of annihilation. Christianity creates an unfailing source of hope — not only of endless happiness, but of eternal progress toward perfection. Buddhism makes self-annihilation the final and highest reward for ages of self-denial, privation, and suffering.

With their admiration of the Buddha, it is to be noted that his followers have never made a god of him. Gautama was only the last Buddha — the Buddha of the present cycle. He had predecessors, and in future cycles another Buddha will appear to again reveal to renascent beings the way to nirvana. He is simply the ideal of what any man may become, and the great object of Buddhist worship is to keep this ideal vividly in the minds of the believers. In the presence of the statue, the tooth, or the footprint, the devout believer vividly recalls the example of him who trod the path that leads to deliverance. This veneration of the memory of Buddha is perhaps hardly distinguishable among the ignorant from worship of him as a present god; but in theory the ritual is strictly commemorative, and does not necessarily involve idolatry any more than the garlands laid on the tomb of a parent by a pious child.

Wherever Buddhism has held its sway it has left a crowd of temples, monasteries, and sacred buildings containing relics of Buddha, most of which are now in ruins. Some fine examples of their rock temples exist at Ellora and on the islands of Salsette and Elephanta. Max Müller, one of the highest authorities on oriental religions, estimates that the Buddhists of the present day number four hundred eighty millions, or about half the population of the world.

ST. PAUL

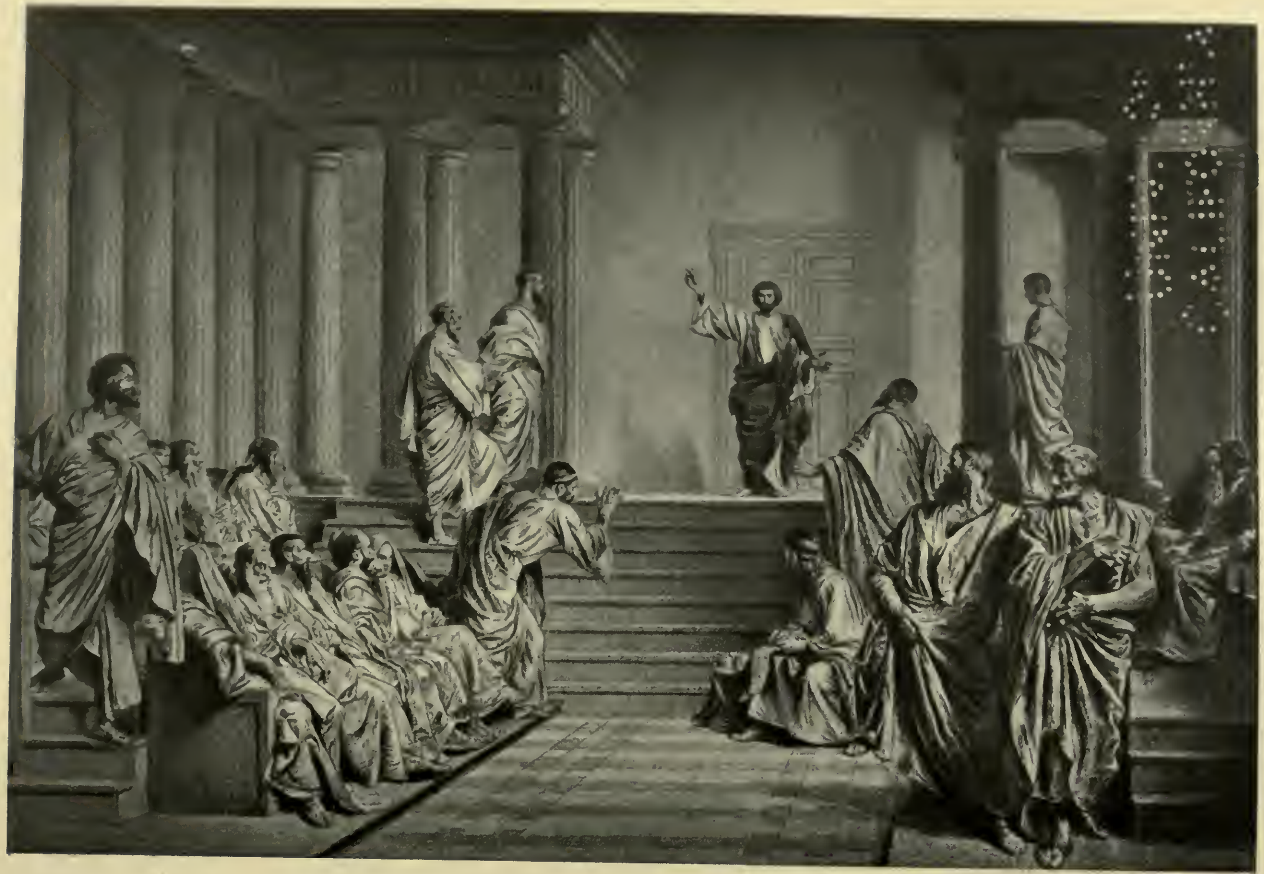
A. D.		AGE	A. D.		AGE
2	Born at Tarsus, Asia Minor,	..	51	Second missionary journey,	49
19	Educated under Gamaliel,	17	57	Third missionary journey,	55
37	Conversion,	35	62	In prison at Rome,	60
40	Preaches at Antioch,	38	64	Released from prison,	62
44	First missionary journey,	42	67	Second trial; martyred,	65

PAUL, the great apostle of Christianity among the Gentiles, and one of the founders of the Christian church, was a native of Tarsus, a Greek city of Cilicia, in Asia Minor, where he was probably born about the second year of the Christian era. All the dates, however, connected with his life, are at best conjectural. His family were Jews, belonging to the tribe of Benjamin, but they enjoyed the right of Roman citizenship. His original name was Saul, afterward Latinized to Paul, and part of his inheritance was the religion of the Pharisees, of which he became an ardent and zealous supporter.

Strabo declares that the schools of Tarsus equaled those of Athens and Alexandria. Here Paul obtained a knowledge of the Greek language and literature, and then, about 19 A. D., went to Jerusalem to study the law of Moses, under the great Jewish doctor, Gamaliel. He also learned the trade of a weaver, or tent-maker, in conformity with the Jewish custom, which required that every male citizen should learn a trade, to gain his living, if required.

A few years after the death of Jesus, he became, as might have been expected from his training and temperament, a furious adversary of the new sect of Christians, which, it was proclaimed, had come to do away with the old Jewish laws. We are told that the Jews of the Cilician synagogue at Jerusalem were among those who disputed with Stephen, and it is natural to suppose that the young and brilliant zealot, eager for disputation, was conspicuous among the crowd of Jewish students who poured out of their synagogues (of which, according to the Talmud, there were four hundred eighty in the holy city), in the insolence of their youth and scholarship, to crush the ignorant followers of the Nazarene. This supposition is rendered highly probable by the fact that he was present at the martyrdom of Stephen, which followed almost immediately.

Paul now became a prominent actor in the great persecution of the Christians which broke out in Jerusalem. When the rumor spread that some of the worst offenders were actual members of the synagogue in Damascus, he obtained an order to go and arrest them, and started for that city, accompanied by Jews and soldiers, about 37 A. D. On the road an incident occurred, which completely changed the character of the man, and transformed him from a fanatical persecutor of the Christian faith into its ardent supporter. The incident has been described in two ways: one supernatural, the other natural. According to the first, the party found themselves suddenly enveloped in a dazzling halo of light, and fell on their faces to protect their eyes. A voice demanded of Paul why he persecuted the Christians, and,



ST. PAUL PREACHING TO THE ATHENIANS
From the painting by Bida

in response to his question, "Who are you?" answered, "Jesus."

According to the second, Paul, overcome by the heat and fatigue of the march, and the mental excitement his mission had brought upon him, fell senseless on the road, and was carried by his companions to Damascus, where he remained for several days blind, a prey to fever and delirium. A Christian named Ananias attended him during his illness. Paul felt remorse for the cruel treatment to which he had subjected the Christians, learned of Ananias enough of their principles to change his opinions completely, became a convert to the new faith, and was baptized. This latter account probably grew out of the fact mentioned in scripture that no one but the apostle heard words. He says himself, "They that were with me heard not the voice of Him that spake to me." It is, therefore, held by some theologians that the miracle was subjective.

Whatever the exact facts may be, there certainly came a day when the enthusiasm for Jesus and His doctrines took possession of him with convincing force, after a fierce internal conflict, and he realized that his highest hopes for humanity lay in his defense of them. With sublime abnegation he surrendered himself to the movement, avowedly its servant, but in reality its leader; and henceforth he preached the gospel of Christianity with a vigor and pertinacity that outstripped all his fellow believers.

After a solitary sojourn in Arabia — perhaps to calm his perturbed spirit in communion with God, and to solemnly prepare himself for his new mode of life — on his return to Damascus, he changed his name to Paul, and resumed or began (it is not quite clear which) his apostolic labors. Naturally, he became an object of intense hostility to the unbelieving Jews in that city. They resolved to kill him; but his friends contrived a way of escape, and he fled to Jerusalem, where at first he was received with suspicion by the disciples, but afterward, through the kind offices of Barnabas, with great cordiality.

He now "spoke boldly in the name of Christ," disputing also against the "Grecians" — i. e., the Hellenistic Jews — with dangerous success, for his opponents sought to take his life. Again he was obliged to flee, and betook himself to his birthplace, Tarsus, where he seems to have remained until Barnabas, about 40 A. D., brought him to Antioch (not far off) to assist in the great work of evangelization going on in that city. After a short visit to Jerusalem in the year of the famine, 44 A. D., Paul and Barnabas were set apart by the prophets and elders of the church at Antioch for the evangelization of the more distant Jews.

From Seleucia they proceeded on their first missionary expedition to the southern districts of Asia Minor, Pamphylia, Pisidia, and Lycaonia, where they met, especially in some places, with considerable success in preaching the gospel. It is very interesting to notice how gradually the light of Christianity dawned on the mind of the apostle. He did not grasp all at once its grand design. It was not even by abstract reflection that he arrived at it. Circumstances of quite an outward sort forced him to the sublime conclusions of his creed. It was when the Jews of Pisidian Antioch, enraged at his preaching the gospel indiscriminately to their Gentile fellow townsmen and themselves, "contradicted and blasphemed" him, that he boldly announced Christ as the universal Redeemer.

After the return of Paul and Barnabas to Antioch, they continued to labor in that city for a long time, until dissensions having arisen about the circumcision of Gentile converts, he, along with Barnabas and others, was chosen to go up to Jerusalem to get the opinion of the apostles and elders there on the question, about 51 A. D. Paul and Barnabas now returned to Antioch, where they continued to teach and preach, until a yearning grew up in the heart of the former to revisit his Gentile converts in Asia Minor.

In his second expedition Paul was accompanied by Silas instead of Barnabas, and traversed the whole of Asia Minor from south to north, evangelizing with great success, after which the two missionaries crossed the Ægean and landed in Europe, planting at Philippi, the capital of Thracian Macedonia, the first Christian church in that continent. The details of his visits to Thessalonica, Berea, Athens, and Corinth are familiar to all Bible readers. We can only notice his appearance at Athens, where on Mars' hill, before a crowd of the citizens, among whom were Epicurean and stoic philosophers, he delivered that magnificent discourse in which he declared to the Athenians the character of the "unknown" God. On his return to Asia Minor he visited Ephesus, where, as usual, he "reasoned" with the Jews in their synagogue;

sailed thence to Cæsarea, in Palestine, and proceeded to Jerusalem "to keep the feast"; after which he again returned to Antioch, the center from which his operations radiated. Thus closed his second evangelistic journey.

The third journey of Paul commenced probably about 57 A. D., and extended over much the same district as the previous one. At Ephesus, where he remained for a period of two years and three months, his efforts were powerfully seconded by the eloquence of one of his converts, Apollos. Driven from Ephesus, he visited Achaia and Macedonia again, and by way of Miletus returned by sea to Jerusalem. There the fanaticism of the Jews against him led to disturbances, whereupon he was brought to Cæsarea to be tried before Felix, the procurator, and, after two years' imprisonment, before King Agrippa, when he defended himself by a noble and eloquent speech. Now, using his right as a Roman citizen, Paul appealed to Cæsar, and in the spring of 62 A. D. arrived in Rome, where he spent two years a prisoner, but in his own hired house. He was executed under Nero about 67 A. D.— probably at the end of a fourth missionary journey, during which tradition makes him visit Spain and other countries.

It must be remembered that the journeys of Paul and his companions were not made like those of modern missionaries, at the expense of rich societies, but resembled the wanderings of journeymen mechanics, seeking employment from place to place. They lived by the labor of their hands — Paul wove tent-cloth — and they remained to work and preach wherever they could find employment. They traveled on foot, lived on little, were frequently ill-treated, sometimes imprisoned, and were fortunate indeed to escape with their lives.

At his death the total number of Christians at the various centers is supposed to have been about one thousand; these primitive groups scarcely numbered more than a dozen members each, the meetings being held in private houses.

There are several representations of the apostle Paul upon medals and in ivory carvings, as well as numerous descriptions of his personal appearance. He was not a handsome man; his face was not pleasing, his figure was short and thick, and round shouldered. Nor was he an eloquent speaker; "his discourse rarely traveled beyond the repeated assertion that Jesus was the true Son of God, put to death by the priests"; but he had an inexhaustible fund of energy, though continually suffering from ill-health, and excited astonishment by his bold audacity in preaching a doctrine that might at any moment subject him to a violent death. A moral hero like this had never before been seen.

Of the twenty-one epistles embraced in the canon of the new testament, fourteen are popularly ascribed to Paul. Of these, the epistle to the Hebrews is pronounced by many critics to be the work of some other hand. The genuineness of the pastoral epistles, the two to Timothy and the one to Titus, of those to the Colossians and Ephesians, and even those to the Philippians, Philemon, and Thessalonians, has also been called in question. It is impossible to determine their chronological order. The two to the Thessalonians are placed first by most of the critics who admit their genuineness, and after them the epistle to the Galatians.

The teaching of Paul aimed at a universal religion. It is certain that he had in him something of all three of the great civilizations of the ancient world; by birth he was a Jew and a Pharisee, yet he was born in a Greek city, a city claiming to rival Athens; but this Greek city was in a Roman province, and entitled him to the privileges of a Roman citizen. Thus he was by his origin and teaching fitted to be the expounder of a cosmopolitan religion. After his conversion he regarded his mission not as Jewish, but as universal. His first hopes for the regeneration of the world he had founded on an extension of Jewish monotheism; but when he was convinced that the crucified and risen Redeemer was for all men, not for the Jewish tribe alone, he established a community wider than the family or the country under the common headship of Christ, which later became the regenerating force of the Roman empire and of its northern invaders. Henceforth there was a new power in the world, modifying the political forces round it, governed by new principles and aiming at new objects. A spiritual power, wholly independent of the state, forming opinion and moulding character, but not claiming to interfere with practical government, arose for the first time in the world's history. The doctrine on which it rested was not such as to satisfy the claims of science. But the importance of this new growth, politically speaking, was immense; and it responded to a permanent need of human society.

The vague benevolence that would ignore the claims of relationship has no place in his teaching. He dwells often on the mutual duties of parents, children, and servants. For his own nation he had a passionate affection. He held the law of Rome in profound respect. His teaching was real, human, genial. His picture of the loving, charitable temper, upheld by him as the highest spiritual gift, is perhaps the noblest ideal ever presented to man. And with all this he knew how to exercise stern spiritual authority when necessary. It is important to notice that, though Christian dogma was to undergo much further development in succeeding centuries, its central institution, the eucharist, was brought by him into full prominence.

Of the great names in early Christianity, St. Peter is often referred to as the apostle of catholicity, St. John as the apostle of love, and St. Paul as the apostle of progress. Each of these three chosen ones represented a special side of human nature — will, emotion, and intellect. While St. Peter is the symbol of the church militant, the rock on which the church is built, St. John the beloved is the forerunner of that mystic love, that tender piety, ever and anon appearing in the course of its history — in the lives of St. Bonaventura, St. Francis, and the author of the "Imitation." These are classed together on the one hand, while its more masculine minds, St. Augustine, St. Thomas Aquinas, Calvin, and Luther, stand on the other, and with them, in a preëminent degree, St. Paul.

But in one quality he transcended them all — in his moral energy. Removed alike from the extremes of fanaticism on the one hand, and apathy on the other, his whole life was a noble instance of the consecration of the highest powers and the most indefatigable energies to a work in which he had no personal interest apart from that of his fellow Christians.

"That life of his," says Dean Farrar, "as it stands revealed to me in his own epistles, how sad it was, and how frightful! From that day on which, blind and trembling, and with the scars of God's own thunder on his soul, he had staggered into the streets of Damascus, what a tragedy had encompassed him of ever deepening gloom! That first peril, when he had been let down in a basket through a window — the flights from assassination — the hot disputes at Antioch — the expulsion from Iconium — the stoning at Lystra — the quarrel with his own heart's brother — the acute spasms of that impalement by the stake in the flesh at Galatia — the agony in Macedonia, of outward fightings and inward fears — the five Jewish scourgings — the three Roman flagellations — the polished scorn of Athens — the factious violence of Corinth — the streaming tears of the parting at Miletus — the gnashing fury of Jewish mobs — the illegal insolence of provincial tribunals — these were but a fragment, and a small fragment, of his trials and miseries. Even the brute forces of nature seemed to be against him — he had to struggle in her rushing water-courses, to faint in her sultry deserts, to toss for long days and nights in leaky vessels on her tempestuous seas. This was the perilous, persecuted life on which he had to look back as he sat chained to the rude legionary in that dreary Roman prison."

But how resplendent do his achievements stand out against this dark background of suffering and deprivation. Through the righteous zeal which burned within, he introduced Christianity to the civilization of Europe, and became its chief champion to all mankind. He exalted the practice of faith, hope, and charity — by these two acts creating a world-religion. Christ being God, St. Paul is His apostle; one the spiritual head, the other the temporal founder of Christianity. During his career he developed a force and play of spirit, a keenness, depth, clearness, and cogency of thought, a purity and firmness of purpose, an intensity of feeling, a holy audacity of effort, a wisdom of deportment, a precision and delicacy of practical skill, a strength and liberty of faith, a fire and mastery of eloquence, a heroism in danger, a love, and self-forgetfulness, and patience, and humility, and altogether a sublime power and richness of endowment, which have secured for him the reverence and wonder of all time.

Imagine the world without St. Paul! It would mean the detention of the gospel, perhaps for centuries, on the borders of Asia, which he has made the center of the conversion and civilization of the world. Imagine the Bible without St. Paul! It would mean Christian truth only half revealed; Christian life only half understood; Christian charity only half known; Christian faith only half victorious.

430	Hippo besieged by Genseric; died at Hippo,.	76

ST. AUGUSTINE, or, in Latin, Lucius Aurelius Augustinus, was the most eminent of the Latin church fathers, and one of the greatest of theologians. The son of Patricius, a pagan nobleman, and the saintly Monica, an earnest Christian, he was born at Tagaste, in Numidia, November 13, 354 A. D.

Augustine's father, a man of violent temper, though at the same time of a kindly disposition, died before his son reached manhood. His mother was a model of gentleness and virtue, the child of Christian parents, and from her youth up accustomed to live under the influence of Christian principles. She sought to win her husband over to Christianity, and also to imbue the mind of their son with religious truth, and to train him in the ways of piety and virtue. For a time, however, it appeared as though her care had been bestowed in vain. Like many another pious mother, she had to go through the severe discipline of seeing her child apparently hastening to ruin before she was permitted to reap the reward of her anxieties and her labors.

Meanwhile, Augustine's intellectual culture was going forward. His father was anxious that he should become a fine scholar, probably chiefly for the reason that he noticed not a few persons in his day who were obtaining large rewards by their wits. Accordingly, Augustine was sent to school at Madaura, and subsequently to Carthage, at the age of seventeen, to complete his studies. When he left home for Carthage, a joyous, ardent, and resolute student, a bright career of worldly prosperity seemed to open before him. But strong as Augustine was, the temptations of Carthage were stronger. His nature, deep, impetuous, and passionate, thirsted for excitement. He had just reached the age when happiness is conceived to be synonymous with pleasure, and Carthage, the second city of the empire, rank as Rome in its sensual corruption, held him captive under its spell. In his "Confessions," he paints the frightful abyss into which he felt himself plunged. Nor does he seek to excuse himself; on the contrary, the shadow of his guilt is thrown forward over all his boyish life, and he displays even a morbid zeal and acuteness in pointing out what others, less censorious, might term the frivolous errors of his childhood, but which seemed to Augustine the parents of his subsequent vices, and, therefore, equally bad and equally reprehensible.

He tells us that he loved the Latin authors, but hated the Greek — a circumstance, he says, he never could fully account for, but which, he adds with much *naiveté*, was probably owing to the difficulty of learning the Greek, to him a foreign language, and to the harshness of his teacher, who enforced his lessons "with savage terrors and punishments." He applied himself with characteristic vigor to the study of eloquence and philosophy. The perusal of Cicero's treatise entitled *Hortensius*, in his nineteenth year, first awakened him to a nobler state of being than he had hitherto aimed at. The study also of Aristotle's categories, he says, exerted a potent and beneficial effect upon his mind. This treatise he read in his twentieth year; and about the same time he mastered, by his own efforts, rhetoric, logic, geometry, arithmetic, and music. He now became impelled by a love of truth to pursue his studies, having before only aspired to be an adroit master of words.

To use the language of Neander: "The conflict now began in his soul which lasted through eleven years of his life. The simplicity of the sacred scriptures possessed no attractions for his taste — a taste formed by rhetorical studies and the artificial discipline of the declamatory schools — especially as his mind was now in the same tone and direction as that of the emperor Julian, when the latter was conducted to the Platonic theosophy. Moreover, he found so many things in the doctrines of the church which, from want of inward experience, could not be otherwise than unintelligible to him, while he attempted

to grasp, by the understanding from without, what can be understood only from the inner life, from the feeling of inward wants, and one's own inward experiences. So, under these circumstances, the delusive pretensions of the Manichæan sect, which, instead of a blind belief on authority, held out the promise of clear knowledge and a satisfactory solution of all questions relating to things human and divine, presented the stronger attractions to his inexperienced youth."

In 373 Augustine became a professed Manichæan. Returning to his native town, he lectured for a short time on rhetoric — that is to say, on literature. Afterward, in 379, he returned to Carthage to pursue his profession under more favorable auspices. Here he wrote, in his twenty-seventh year, his first work, *De Apto et Pulchro*, "On the Befitting and the Beautiful" — a treatise on æsthetics, which has unfortunately been lost. About the same time his spiritual nature became keener and more imperative in its demands. The futile speculations of the visionary sect to which he had attached himself now became apparent. He had a series of interviews and conversations with Faustus, one of the most celebrated teachers of Manichæism; and these so utterly disappointed his expectations that he left the society in disgust and sad bewilderment, after having wasted ten years in a fruitless search for wisdom and truth.

In 383 he went to Rome, followed by the tears, the prayers, and the anxieties of his excellent mother, who was not, however, bereaved of hope, for both her faith and her love were strong. After a short stay, Augustine left Rome, and proceeded to Milan, where he became a teacher of rhetoric. No change could have been more fortunate. Here he came under the influence of Ambrose, bishop of Milan, a man of eminence alike for his piety and eloquence. To him Augustine was attracted in the first instance by his kindness to him. "The man of God," says he, "received me like a father, and loved the stranger like a true bishop. And I began to love him, at first, indeed, not as a teacher of the truth, which I had no hope of then finding in the church, but as a man who had been kind to me."

He became an assiduous attendant on Ambrose's ministry, not, as he confesses, from any great interest he took in the matter of his discourses, but because he was delighted with the elegance and suavity of his style, and, as a teacher of rhetoric, wished to study him as a master of oratory. Gradually, however, he found that there was something beyond the mere elocution of the preacher deserving his attention. He felt convinced that the Christian faith could, in many points, be successfully defended against the Manichæans.

At this time, however, his mind was in anything but a settled state. He was, in fact, neither a Manichæan nor a Christian. Though he placed himself under Christian instruction, he was in reality a sceptic, "in doubt about all things, and fluctuating from one thing to another through all." Still he adopted the wise expedient of thoroughly exploring the Christian doctrine, if, haply, he might find a resting-place in it for his intellect and heart. He was a diligent hearer of Ambrose, from whom he imbibed with much readiness the maxim often enunciated by him, "The letter killeth, but the spirit giveth life." But he demanded a certainty of conviction before he would embrace Christianity, which the nature of the case did not admit. He wanted mathematical certainty, such as we have for the belief that "seven and three are ten." Consequently, he still remained in doubt and perplexity, like a man afraid of falling over a precipice should he advance.

He seems at this time, also, to have been still under the influence of that sensuality which had tyrannized over him at an earlier period of his life, and to have led a life by no means pure. He was helped to a healthier state of mind by the perusal of several treatises of Plato and the Platonists, which, he says, "enkindled within me an inconsiderable conflagration." The effect of these on his mind was to counteract the materalizing tendency of Manichæism, and to prepare him for the reception of the spiritualities of Christianity. Platonism of itself could not satisfy him. He rested in it for a while, but ere long found that it was not adequate to his inner needs. It taught him to seek "incorporeal verity," and helped him "to prattle as if he were a proficient," but it could not satisfy the conscience nor purify the heart. "I was puffed up," he says, "with knowledge; for where was that charity which buildeth on the foundation of humility, which foundation is Christ Jesus? Else how could these books teach me it?"

Reinvigorated, however, by his Platonic studies, he turned with fresh ardor to the perusal of scripture, and especially to the epistles of St. Paul. These he read with a mind gradually opening to divine truth, and growing with a conformity to the mould of doctrine therein taught; and to this, aided by the teaching of Ambrose and the conversations of Simplician, a presbyter of the church of Milan, his ultimate conversion to Christianity is to be instrumentally ascribed. Having, after many struggles, and as the result of grave deliberation, resolved publicly to profess himself a Christian, he was baptized by Ambrose on April 25, 387 A. D.

A friend and fellow townsman, named Alypius, and his natural son Adeodatus, born while he was pursuing his studies at Carthage, were baptized along with him. His mother, Monica, to whom he had conveyed the news of his conversion, was present at this ceremony having hastened from Africa to Milan; to her it was an exultation, when her mourning was turned into gladness, and a full reward for all her instructions, anxieties, and prayers, was poured into her bosom. As if the great end of her life was now gained, she did not long survive this event. Her son resolved to return with her to Africa, but she was taken ill during her journey at Ostia, on the banks of the Tiber, and in 387 died there, after a short illness, in the fifty-sixth year of her age.

After the death of his mother, Augustine remained some time at Rome, where he wrote treatises against the Manichæans, and on free will. His character and principles of action had now become fixed, and he brought the whole majesty of his intellect to bear upon the side of Christianity. He returned in the year 388 to Tagaste, where he sold the remains of his paternal property, gave the proceeds to the poor, and gave himself up to religious meditation.

In 391 he was ordained a priest by Valerius, bishop of Hippo; and during the next four years, though earnestly engaged in the work of preaching, contrived to write three different works. In 395 he was made colleague of Valerius, as bishop of Hippo. Then ensued a period of hot strife, known in church history as the Donatist and Pelagian controversies, in which he took the main part on the orthodox side. It is from these writings against Pelagius that we obtain the fullest view of his theological system. Augustine, as may naturally be supposed, having passed through so fierce a fire of personal experience on religious questions, would be very jealous both of what he knew to be the truth, and of what he only thought to be the truth. This, added to his acute and profound intellect, made him, in spite of the poverty of his historical erudition, a most formidable and relentless antagonist. In 397 appeared his *Confessiones,* a deep, earnest, and sacred autobiography of one of the greatest intellects the world has seen. In 413 he commenced his *De Civitate Dei*, and finished it in 426. It is generally considered his most wonderful work.

Augustine held his place as bishop of Hippo until the year 430, when he died in the seventy-sixth year of his age. His end was peaceable, though amid scenes of violence and suffering. The Vandals under Genseric had laid siege to Hippo during that year, and for many months exposed its inhabitants to peril and straits. The aged bishop, pained by the scenes which constantly met his eye, and anticipating still greater disasters, earnestly besought of God deliverance for the people from their enemies, and for himself a speedy emancipation from all earthly burdens and cares. His prayer for himself was heard; in the third month of the siege, on the 28th of August, he was, to use the words of Gibbon, "gently released."

Augustine was a very voluminous writer, and a large proportion of his writings still remain. Of these the most important are his "Confessions," *Retractationes*, or "Retractations," "The City of God," and his homilies and comments on portions of scripture — particularly his "Commentary on the Sermon on the Mount."

His "Confessions" contain a history of the earlier period of his life, interspersed with reflections, and addressed to God, which, if they somewhat interrupt the course of the narrative, more than compensate for this by the insight they give us into the heart and soul of the man. His "Retractations" was the work of his old age, and contains a sort of review of all his previous writings and opinions, in which, with characteristic candor, he retracts and condemns what his maturer judgment led him to deem erroneous or imperfect.

"The City of God" is perhaps, as a whole, his greatest production. It is an elaborate defense of Christianity, and a refutation of pagan mythology and philosophy, undertaken in consequence of an attempt on the part of the pagans to cast the odium of the sacking of Rome by the Goths on Christianity. On this work Augustine spent thirteen years, and it remains a monument of his knowledge, eloquence, and mental strength. "'The City of God,'" says Milman, "is at once the funeral oration of the ancient society, and a gratulatory panegyric on the birth of the new. It acknowledged, it triumphed in the irrevocable fall of the Babylon of the West, the shrine of idolatry; it hailed, at the same time, the universal dominion which awaited the new theocratic polity. The earthly city had undergone its predestined fate; it had passed away, and all its vices and superstitions — with all its virtues and its glories (for the soul of Augustine was not dead to the noble reminiscences of Roman greatness) — with its false gods and its heathen sacrifices: its doom was sealed, and forever. But in its place had arisen the city of God, the church of Christ; a new social system had emerged from the ashes of the old: that system was founded by God, was ruled by divine laws, and had the divine promise of perpetuity."

The grandeur of the occasion on which this book was conceived, and of its general subject, is unsurpassed in literature. In 410 Rome was taken and sacked by the Goths under Alaric. The wail sent up from the empire included the indignant complaint of many that the public disasters were due to the forsaking of the ancient gods. Thus the whole issue between polytheism and Catholic monotheism was raised before a world-wide audience, deeply interested, and deeply excited. Augustine, "outflaming with zeal for God's house," stepped forth as the champion of Christianity, and produced this monumental work.

As an interpreter of scripture, Augustine does not rank as high as he does as a theologian — a polemic. He lays down excellent rules of exegesis, but does not himself adhere to them, and consequently it is rather for their homiletical and spiritual merits than for their exegetical worth that his commentaries are in repute. It is in the department of ethical and polemical theology that his merit lies. He was the father alike of the mediæval scholasticism and of the theology of the mystics.

The central tenets of his creed were the corruption of human nature through the fall of man, the consequent slavery of the human will, predestination, election, and reprobation, and the perseverance of the saints. It was not by his controversial writings merely, but by his profound conception of Christianity and the religious life, and by his personal fervor and force of character that Augustine moulded the spirit of the Christian church for centuries, so that, at the reformation, Protestants and Catholics alike appealed to his authority.

No mind has exerted greater influence on the church than that of Augustine. He was a man of powerful and acute intellect, which he had cultivated by diligent study. His writings are somewhat rugged, but full of force and fire; and in many of his works there is an undercurrent of sentiment and tenderness which lends an indescribable charm to the whole. His conduct after he became a Christian was marked by scrupulous integrity and purity, and impressed all who beheld it with a conviction of the sincerity of his profession. As a bishop he was conscientious and diligent; unmoved by worldly ambition, he remained "faithful to his first bride, his earliest though humble see"; and when dangers surrounded his flock, he refused to desert them, but, like a true pastor, remained to share with them in their privations, and to lend them what aid and encouragement his presence could supply. The holy light of faith and hope that was in him was not extinguished by his death, but only ascended to a higher place, and has been shining through the centuries ever since.

"No Christian teacher since the days of the apostles," says Dr. William Bright, "has influenced Christian thought so powerfully as St. Augustine. This influence has sometimes been, so to speak, imperial: the 'doctor of grace' has reigned in the schools of theology; his Benedictine editors in the seventeenth century described him as 'the oracle of the church'; and, as Archbishop Trent has told us, a Spanish sermon was proverbially said to lack its best ingredient if it contained nothing out of Augustine."

"The vehement temperament," adds Walter Bagehot, "the bold assertion, the ecstatic energy of men like St. Augustine or St. Paul, burn into the minds and memories of men, and remain there at once and forever. Such men excel in the broad statement of great truths which flash at once with vivid evidence on the minds which receive them. The very words seem to glow with life; and even the sceptical reader is half awakened by them to a kindred and similar warmth. Such are the men who move the creeds of mankind, and stamp a likeness of themselves on ages that succeed them."

632	Died at Medina, ...	62

MOHAMMED, or MAHOMET, the founder of Mohammedanism, was born about 570 A. D., at Mecca, Arabia. According to tradition, he was an Ishmaelite — a descendant of Ishmael, son of the Hebrew Abraham and Hagar. His father, Abdallah, a poor merchant, though he belonged to the tribe of the Koreish — one of the noblest of Mecca, the sacred city, and center of Arabian commerce — died two months after the birth of his son. At the age of six years he lost his mother, Amina, and was carried to his grandfather, Abd al-Muttalib. Two years later he also lost his grandfather, and was then adopted by his uncle, Abu Talib, who held the key to the Kaaba, and who remained Mohammed's best friend and protector throughout his whole life.

The accounts of his early life are of too legendary a nature to deserve entire credit; but it seems certain that he first gained a scanty livelihood by tending the flocks of his uncle, and other Meccans, and that he made trading journeys with the former to southern Arabia, and to Syria. At the time of these journeys he was about twelve years of age; and it is believed that through them he learned many facts about the religions of western Asia. He was already marked out from his fellows by abstinence from coarse pleasures, and by unstained loyalty, and had received the name Al-Amin, "the faithful."

In his twenty-fifth year he entered the service of a rich widow, named Khadija, likewise descended from the Koreish, and accompanied her caravans — in an inferior capacity, perhaps as camel-driver — to the fairs. Up to that time his circumstances were very poor. Suddenly his fortune changed. The wealthy, but much older, and twice widowed Khadija offered him her hand, which he accepted. She bore him a son, Al-Kasim — whence Mohammed adopted the name Abu al-Kasim — and four daughters: Zainâb, Rukaija, Umm Kulthum, and Fatima; and afterward a second son, whom he called Abd Manaf, after an idol worshiped among his tribe. Both his sons, however, died early. Mohammed continued his merchant's trade at Mecca, and in his thirty-fifth year he is said to have been chosen, by chance only, arbiter in a quarrel about the replacing of the sacred black stone in the Kaaba.

For several years it was noticed that he often withdrew himself to a lonely cave outside the city, and remained there for hours and days wrapped in intense thought. There, at the mountain of Hira, near Mecca, when he was forty years of age, he had his first vision, in which — according to the tradition — the angel Gabriel commanded him to recite the message given to him. "The work of his life was revealed to him in flashes of prophecy, scorching like bolts from heaven, whitening his hair and for the time paralyzing his strength. In the name of God, it was laid upon him to preach the true religion."

At this time, in Arabia, no central government had been set up through the vast peninsula. Various tribes, partly nomad, partly sedentary, held sway through ill-defined districts. A certain unity was maintained by language, by community of custom, by mercantile and religious pilgrimages.

"The period before the advent of Mohammed," says Ockley, "is called by the tribes the age of darkness or ignorance. The 'sciences' cultivated by them were that of their genealogies; a knowledge of the stars to foretell the changes of the weather, and the interpretation of dreams. The accomplishments on which the Arabs valued themselves chiefly were eloquence, a perfect skill in their own tongue, expertness in the use of arms, horsemanship, and hospitality. The exercise of arms and horsemanship they were obliged to practice and encourage, by reason of the independence of their tribes, whose frequent jarrings made war almost continual, and they chiefly ended their disputes in field battles. It was a usual saying among them that God had bestowed four peculiar things on the Arabs: that their turbans should be to them instead of diadems, their tents instead of walls and houses, their swords instead of intrenchments, and their poems instead of written laws.

"Their minds, however, were liberal, their hearts cheerful, their pedigrees pure and genuine; the words flowed from their mouths like arrows from a bow, but milder than the breezes of spring, and sweeter than honey. Their ideal man was pictured to be 'free and liberal, an eloquent poet, and a successful robber.'"

Mecca was a religious center. From time immemorial it had been the sacred city; pilgrimages to Mecca had been for the Arabs what the Olympic games were to the Greeks. Here was the sharp conflict of religious ideas — Jews, Christians, Magi, mingled with innumerable oriental idolatries, all centered in Mecca and the temple had become a pantheon. In it were statues of Abraham, Ishmael, statues of angels and of the Virgin, sacred stones, representations of planets and stars, a deity for every day in the year. Indeed, Abraham was regarded as the founder of this temple, and here Hagar took refuge with Ishmael when driven forth. Jews were settled in many of the surrounding towns, and had told the story of their nation, and their religion, and Christian ascetics lived in the desert places.

Meditating amid these influences, Mohammed's mind was seriously affected. Of a singularly impressionable temperament, the times weighed heavily upon him; and, when his mission in life was revealed to him, he determined to lift the tribes around him above their lawless life of pillage, sensuality, and idolatry, by unveiling the presence of an all-powerful God who judged the earth, and who sent Mohammed, the last of a long line of prophets, to bring all nations to Islam —the perfect surrender of the will to God.

His first revelation he communicated to no one but his wife, daughters, step-son, and one friend, Abu Bekr. In the fourth year of his mission, however, he had made forty proselytes, chiefly slaves and very humble people; and now some verses were revealed to him, commanding him to come forward publicly as a preacher. God's mercy was principally to be obtained by prayer, fasting, and almsgiving. The Kaaba and the pilgrimage were recognized by the new creed. The prohibition of certain kinds of food belongs to this first period, when Mohammed was under the influence of Judaism; the prohibition of gambling, usury, and wine came after the hegira. His earliest teachings, written down by amanuenses, consisted of brief, rhymed sentences, and for a time the Meccans considered him a common "poet" or "soothsayer," perhaps not in his right senses.

Gradually, however, fearing for the sacredness of Mecca, they rose in fierce opposition against the new prophet and his growing adherents. Many of the converted slaves and freedmen underwent terrible punishments; some suffered so much that they abjured their creed. Mohammed's faithful wife Khadija died, and his uncle and protector, Abu Talib; and he was reduced to utter poverty.

He now, with his followers, emigrated to Taif, where he sought to improve his position; but this resulted in failure, and it was with difficulty that he escaped with his life. During this epoch he had the well-known dream of his journey to Jerusalem and in the heavens on the back of the Borak (Miraj), the relation of which caused even his stanchest adherents to smile at his hallucination. Shortly after his return from Taif he married Sauda, and afterward so increased the number of his wives that at his death he still left nine, of whom Ayeshah, the daughter of Abu Bekr, and Hafsa, the daughter of Omar, are best known.

In the midst of his vain endeavors to find a hearing in his own city, and those near it, he succeeded, during a pilgrimage, in converting several men from Medina, whose inhabitants had long been accustomed to hear, from the mouths of the numerous Jews living in the city and its neighborhood, the words revelation, prophecy, God's word, messiah, to the Meccans mere sounds without any meaning. The seed sown into the minds of these men bore a fruitful harvest. The next pilgrimage brought twelve, and the third more than seventy adherents to the new faith from Medina, and with these he entered into a close alliance. Mohammed now conceived the plan of seeking permanent refuge in the friendly city of Medina, and about 622 he fled thither, about one hundred families of his faithful flock having preceded him some time before, accompanied by Abu Bekr, and reached, not without danger, the town afterward called Medinat Annabi, "city of the prophet," by way of eminence. This was the great movement, called in history the hegira, and from it dates the beginning of the Arabian nation, as well as the Mohammedan era.

Now everything was changed to the advantage of the prophet and his religion; and if formerly the incidents of his life are shrouded in comparative obscurity, they are from this date known often to their most insignificant details. Formerly a despised "madman or imposter," he now assumed at once the position of highest judge, lawgiver, and ruler of the city and two most powerful Arabic tribes. His first care was directed toward the consolidation of the new worship, and the inner arrangements in the congregation of his flock. His next chief endeavor was to proselyte the numerous Jews who inhabited the city, to whom, besides having received their principal dogmas into his religion, he made many important concessions also in the outer observances of Islam, and concluded alliances with many of their tribes; but he was sorely disappointed in his hopes to convert them. They ridiculed his pretension to be the messiah, and so enraged him by their constant taunts that he soon abrogated his concessions, and became their bitterest enemy up to the hour of his death.

The most important act in the first year of the hegira was his permission to go to war with the enemies of Islam — especially the Meccans — in the name of God. The first battle, between three hundred fourteen Moslems and six hundred Meccans, was fought at Badr, in December, 623; the former gained the victory and made many prisoners. A great number of adventurers now flocked to Mohammed, and he successfully continued his expeditions against the Koreish and the Jewish colonies. In January, 625, the Meccans defeated him at Ohod, where he was dangerously wounded. The siege of Medina by the Meccans in 627 was frustrated by Mohammed's ditch and earthworks. In 628 he made peace with the Meccans, and in 629 celebrated the pilgrimage with two thousand followers for three days at Mecca.

His missionaries at this time began to carry his doctrines abroad to Chosroes II., to Heraclius, to the king of Abyssinia, the viceroy of Egypt, and the chiefs of several Arabic provinces. Some received the new gospel; but the king of Persia, and Amru, one of the Arabian chiefs, rejected his proposals with scorn, and the latter had the messenger executed. This was the cause of the first war between the Christians and the Moslems, in which the latter were beaten with great loss by Amru. The Meccans now thought the long-desired moment of revenge at hand, and broke the peace by committing several acts of violence against the Chuzaites, the allies of Mohammed. The latter, however, marched at the head of ten thousand men against Mecca before its inhabitants had time to prepare for the siege, took it, and was publicly recognized by them as chief and prophet. With this the victory of the new religion was secured in Arabia.

While employed in destroying all traces of idolatry in the besieged city, and fixing the minor laws and ceremonies of the true faith, Mohammed heard of new armies which several warlike Arabic tribes marched against him, and which were concentrated near Taif. Again he was victorious, and his dominion and creed extended further and further every day. From all parts flocked the deputations to do homage to him in the name of the various tribes, either as the messenger of God, or at least as the prince of Arabia, and the year 8 of the hegira was, therefore, called the year of the deputations. Once more he made most extensive preparations for a war against the Byzantines; but not being able to bring together a sufficient army, he had to be satisfied with the homage of a few minor princes on his way to the frontiers, and to return without having carried out his intention.

Toward the end of the 10th year of the hegira he undertook, at the head of at least forty thousand Moslems, his last solemn pilgrimage to Mecca, and there on Mount Arafat instructed them in all the important laws and ordinances, chiefly of the pilgrimage; and the ceremonies observed by him on that occasion were fixed for all times. He again solemnly exhorted his believers to righteousness and piety, and chiefly recommended them to protect the weak, the poor, and the women, and to abstain from usury.

After returning from Mecca, he occupied himself again with the carrying out of his expedition against Syria, but fell dangerously ill very soon after his return. One night, while suffering from an attack of fever, he went to the cemetery of Medina, and prayed and wept upon the tombs, praising the dead, and wishing that he himself might soon be delivered from the storms of this world. For a few more days he went about; at last, too weak further to visit his wives, he chose the house of Ayeshah, situated near a mosque, as his abode during his sickness. He continued to take part in the public prayers as long as he could. At last, feeling that his hour had come, he once more preached to the people, recommending Abu Bekr and Osama, the son of Zaid, as the generals whom he had chosen for the army. He then asked, like Moses, whether he had wronged any one, and read to them passages from the Koran, preparing the minds of his hearers for his death, and exhorted them to peace among themselves, and to strict obedience to the tenets of the faith.

A few days afterward he asked for writing materials, probably in order to fix a successor to his office as chief of the faithful; but Omar, fearing he might choose Ali, while he himself inclined to Abu Bekr, would not allow him to be furnished with them. In his last wanderings he only spoke of angels and heaven. He died in the lap of Ayeshah, June 8, 632. His only surviving child was Fatima, the wife of Ali, and the ancestress of all the *sherifs*, or nobles, of the Mohammedan world.

His death caused an immense excitement and distress among the faithful, and Omar, who himself would not believe it, tried to persuade the people that he was still alive. But Abu Bekr said to the assembled multitude: "Whoever among you has served Mohammed, let him know that Mohammed is dead; but he who has served the God of Mohammed, let him continue in His service, for He is still alive, and never dies." While his corpse was yet unburied, the quarrels about his successor, whom he had not definitely been able to appoint, commenced; and, finally, Abu Bekr received the homage of the principal Moslems of Medina. Mohammed was then buried in the night, after long discussions from the 9th to the 10th of June in the house of Ayeshah, which afterward became part of the adjoining mosque.

In personal appearance, Mohammed is described as of middle height, rather lean, but broad shouldered, and altogether of strong build; slightly curled black hair — at least before his conversion — flowed round his strongly developed head. His eyes, overhung with thick eyelashes, were large and coal-black; his nose, large and slightly bent, was well formed. A long beard added to the dignity of his appearance. His countenance was mild and pensive, and his laugh rarely more than a smile. In his walk he moved his whole body violently, "as if descending a mountain." His gait and presence were altogether of an extremely imposing nature. He was of a nervous and melancholic temperament, and throughout his life was subject to epileptic attacks. He possessed great natural eloquence, a keen intellect, an overwhelming fluency of speech, and indomitable courage. Once, in the thick of persecution, when urged by his uncle to desist from his crusade, he replied: "If they brought me the sun to my right hand and the moon to my left, to force me from my work, I would not leave it till the Lord had made my cause good, or till I perished."

In his habits he was extremely simple. He visited the sick, followed any bier he met, accepted the invitation of a slave to dinner; mended his own clothes, milked his goats, and waited upon himself. He never withdrew his hand first out of another man's palm, and turned not before another had turned. Tradition says he was most generous, most truthful; the most faithful protector of those he protected; the sweetest and most agreeable in conversation; those who saw him were suddenly filled with reverence; those who came near him loved him; they who described him would say, "I have never seen his like either before or after."

What Confucius was to the Chinese, Zoroaster to the Persians, Pythagoras and the Seven Sages to the Greeks, Moses to the Hebrews, Mohammed was to the Arabians. When the religious elements are ready, a great man has always arisen in history to put them together; the mass is organized into a system, a code, a bible, and upon this nucleus a nation is born. Confucius, like Pythagoras, was philosopher and legislator; Buddha was priest and philosopher; Moses, Zoroaster, and Numa were priests and legislators; Orpheus was reputed priest and poet; but Mohammed was poet, priest, philosopher, legislator, and conqueror, all in one. He was a theocrat of the fullest type.

Coming last of the theocrats, he had special advantages, and he used them well. Before his death all Arabia had submitted, and threats had been sent to the great potentates of the world, the rulers of Rome and Persia. Once before the Arab hordes had encountered the Roman legions. The life and soul of these aggressions was Omar, an early convert, a daring warrior, the "St. Paul of Islam," the real hero of the crescent. Mohammed died, but the crusade went on. Syria, Persia, and Egypt bowed before the shibboleth, "Koran, tribute, or sword." Damascus was stormed and taken, then Jerusalem, then

Balbeck, Antioch, Alexandria, all Persia; Islamism nearly overran the world. It was checked in the West by Charles Martel, and in the East by Leo the Isaurian, but it had won an empire like that of Alexander or Cæsar.

The origin of most religions is lost in an obscurity of myth and miracle; that of Mohammedanism is as clear as day. Of all the religions of the world, it is the one that has the least mystery about it, and especially is there no mystery about its founder. Mohammed's whole religious system, temporal as well as spiritual, is embodied in the Koran, which is the standard of faith, as well as the basis of Mohammedan law. Commentators divide the Koran into three general heads: (1) Directions, relating either to religion, as prayers, fasting, pilgrimage; or to civil polity, as marriages, inheritances, judicatures. (2) Histories, chiefly from the sacred writings of the Hebrews. (3) Admonitions, under which head are comprised exhortations to receive Mohammedanism, to fight for it, to practice its precepts, prayer, alms, etc.; the moral duties, such as justice, temperance, etc.; promises of everlasting felicity to the obedient, dissuasion from sin, threatenings of the punishments of hell to the unbelieving and disobedient. The style of the work is wild and rhapsodical in the early part, prosaic and narrative in the second, official and authoritative in the last.

The parts of the Koran, it should be remembered, were not composed at will by Mohammed, as ordinary books are made; but its chapters, without exception, came to his mind while in a certain excited mental state, ecstasy, or trance, in which he had visions of angels, saw lights, heard voices, and had truths put into his mind.

Mohammedanism, as a whole, recognizes four main articles, one belonging to the dogma or theory, the rest to the worship or practice. The former is the confession of faith which every Moslem considers as the summary of his religion, viz.: "There is no God but the true God, and Mohammed is His messenger"; but this article includes six distinct elements: (1) belief in God; (2) belief in His angels; (3) belief in His scriptures; (4) belief in His prophets; (5) belief in the resurrection and judgment day; (6) belief in the absolute decree of God, and in the predestination of good and evil.

The four articles including worship and practice are: (1) prayer; (2) alms; (3) fasting; (4) pilgrimage to Mecca.

Under the head of the prophets, the Koran teaches that God has revealed Himself to various men in divers ages of the world. He gave the pentateuch to Moses; the psalms to David; the gospels to Christ, and the Koran to Mohammed. The happiness promised to Mohammedans in paradise is wholly material: fine gardens, rich draperies sparkling with gems and gold, delicious fruits and wines that neither cloy nor intoxicate; but, above all, affording the fruition of all the delights of love, is the society of women having large black eyes, and every trait of exquisite beauty, who shall ever continue young and perfect.

As to the punishments threatened to the wicked, they are hell fire, breathing hot winds, drinking foul and boiling water, eating briars and thorns, and the bitter fruit of the tree of Zacom, which shall feel in their stomachs like burning pitch. Concerning the decrees of God, it is held that everything that has or will come to pass has been from all eternity written on the secret tablet, a white stone of immense size preserved in heaven near the throne of God. "Whatever is written against thee will come to pass; what is written for thee shall not fail; resign thyself, therefore, to God, and know thy Lord to be powerful; His decrees will certainly take place; His servants ought to be silent." The time of every man's death is so unalterably fixed that he cannot die before the appointed hour, and, when that hour is come, no caution whatever can prolong his life one moment. Even those in battle would certainly have died at the same time if they had been in their houses. The effect of this teaching was to make the people fearless and ready to fight.

Of the four fundamental points of practice, the foremost is prayer. This duty is to be performed five times a day. In the morning before sunrise; when noon is past; a little before sunset; a little after sunset; and before the first watch of the night. Previous to prayer, the faithful are to purify themselves by washing. On the point of fasting they are to go each day, during the month of Ramadan, from sunrise to sunset without food, drink, or any indulgence. The last practical duty is going on the pilgrimage to the holy city of Mecca, which every one is obliged to perform once in his lifetime. Next in discipline is the matter of alms. Here the natural liberality of the Arab is made manifest. It is his disposition to be more liberal and hospitable than others, and to give riches away as fast as he obtains them. This habit of prodigality was elevated by Mohammed into a religious law.

Although Mohammed ranks far above all other Arabic writers as a poet, his character as a prophet far transcends that of the literary artist. For four hundred years the terrible voice of the prophet quenched, in Arabia, all song and poesy. When the impulse came to him to "cry out! recite! preach!" the epoch of poetry gave way to one of prose.

"He preached Islam," says Deutsch, "and he preached it by rending the skies above and tearing open the ground below, and by abjuring heaven and hell, the living and the dead. The Arabs had ever been proficient in the art of swearing, but such swearing had never been heard in and out of Arabia. By the foaming waters and by the grim darkness, by the flaming sun and the setting stars, by Mount Sinai and by Him who spanned the firmament, by the human soul and the small voice, by the Kaaba and by the book, by the moon and the dawn and the angels, by the ten nights of dread mystery and by the day of judgment. That day of judgment, at the approach whereof the earth shaketh, and the mountains are scattered into dust, and the seas blaze up in fire, and the children's hair grows white with anguish, and like locust-swarms the souls arise out of their graves, and Allah cries to hell, 'Art thou filled full?' and hell cries to Allah, 'More, give me more!' * * * while paradise opens its blissful gates to the righteous and glory ineffable awaits them."

"All is vain, that is not God." This was his teaching, and this in the beginning was his life; and there is something sublime in the luminous path which his enthusiastic spirit struck out for itself through the bewildering maze of adverse faiths and wild traditions that the world will never cease to admire.

James Freeman Clarke, in *Ten Great Religions*, points out thus the relations of the three Semitic creeds. Judaism and Mohammedanism both leave God outside the world. "Above all, as its creator and ruler, above all as its judge, but not through all and in all. The idea of an infinite love must be added and made supreme in order to give us a being who is not only *above* all but *through* all, and *in* all. This is the Christian monotheism. Mohammed teaches a God above us, Moses teaches a God above us and yet with us. Christ teaches a God above us, God with us, and God in us."

GREGORY VII.

A. D.		AGE
1020?	Born at Saona, Italy, ...	..
1038	Entered monastery of Cluny, ...	18
1046	Invited to Rome, ...	26
1050	Cardinal sub-deacon, ...	30
1054	Papal legate to German emperor; also to France, ...	34
1073	Elected pope as Gregory VII., ...	53
1075	Opposes Henry IV. of Germany, . .	55
1076	Henry deposes Gregory; Gregory excommunicates Henry, ...	56
1077	Absolved Henry IV., ...	57
1080	Renewed the excommunication of Henry IV., ...	60
1084	Besieged by Henry IV. in castle of St. Angelo, ...	64
1085	Died at Salerno, in exile, ...	65

POPE GREGORY VII., otherwise known as HILDEBRAND, shares with Innocent III. the distinction of being one of the two greatest Roman pontiffs. He was preëminently the historical representative of the temporal claims of the church during the middle ages, which culminated in the great pontificate of Innocent III.

He was born about 1020, at Saona, a village on the southern border of Tuscany, near Siena, Italy. The history of his early years is somewhat obscure. Whether his family belonged to the burgher or the noble class is disputed by his biographers. His own name, Hildebrand, is suggestive of a Germanic extraction; but by birth and education, at least, he was Italian. Of his remoter ancestry nothing is definitely known.

His youth was passed at Rome, in the monastery of St. Mary on the Aventine, of which his uncle Laurence — afterward bishop of Amalfi — was abbot. From Rome he passed into France, where he entered the celebrated Benedictine monastery of Cluny, about 1038, in the schools of which his education was completed. From the strict ascetic observances he there practiced, he probably acquired those austere habits which were a distinguishing mark of his entire life.

About 1046 Hildebrand was called to Rome where he was made prior of the abbey of St. Paul's without the walls, and chaplain of the newly elected pope, Gregory VI. He shortly afterward accompanied Gregory VI. into his German exile, and, apparently under the patronage of the emperor Henry III., continued his studies at Cologne. By his preaching there and elsewhere he obtained a reputation for great eloquence, and visited the court of Henry III. He attended the council at Worms in 1049, and is said in a very special way to have come under the notice of Bruno, bishop of Toul, then on his way to Rome to take possession of the chair of St. Peter, which he occupied for some years under the title of Leo IX. It was at Hildebrand's instance that Bruno, who had been nominated by the emperor merely, consented to refrain from assuming the pontificial vestments, and to present himself to the Romans in the garb of a simple pilgrim, until he should have been elected in a more regular manner. This ascendancy which Hildebrand had thus acquired over this active and devoted pontiff, he never afterward lost; and he virtually directed the conduct and succession of the holy see through the reigns of five pontiffs, during the eventful years 1048–73.

In 1050 he became cardinal sub-deacon, and in the following years he was intrusted with various missions of great importance, and, by inspiring into the government of the church the great principles to which his life was vowed, he prepared the way for the development of his own theory of the papacy. He began by taking a prominent part in the important synods of Rheims and Mainz, as well as in those of Rome. On the death of Leo IX. in 1054, the Roman people had signified a desire that the sub-deacon should succeed him. This honor and responsibility, however, Hildebrand declined; but he was one of the three legates who went to Germany to consult with the emperor about the choice of a successor. The negotiations, which lasted eleven months, ultimately issued in the election of Gebhard of Eichstätt, a relative of the emperor, who up to that time had followed a distinctly anti-papal policy, but who, immediately after his reception and consecration at Rome in 1055, as Victor II., became as entirely reconciled to the policy of Hildebrand as Leo had been. It was during this pontificate that Hildebrand, as papal legate, attended the French synods held for the purpose of representing the heresy of Berengarius, and was instrumental in having many bishops deposed for simony.

On the election of Pope Stephen IX., Hildebrand was sent to Germany, in 1057, to defend the choice before the empress Agnes, and in this mission, which was ultimately successful, several months were spent. Again, in 1058, he succeeded in defeating the hostile party of Benedictine X., and in securing the tiara for Nicholas II. During the pontificate of the latter, he took a prominent part in the Lateran council which effected the momentous change in the mode of papal election, getting rid of the turbulent popular element. Once more, in 1061, he successfully labored for the election of Alexander II. to the papal chair, and in Alexander's name upheld, against the German sovereign, the purity and liberty of the church, and the obligation of the marriage vow; sent the conqueror of England his consecrated banner; and required his archbishop to come to Rome for the *pallium*.

At length, in 1073, on the death of Alexander, Hildebrand was himself, as it were, compelled by the tumultous demands of the mob to accept the vacant tiara; but he refused to receive consecration until the sanction of the emperor had been obtained. This did not arrive for more than a month, although meanwhile he had been practically exercising many of the papal functions; finally, however, he was ordained to the priesthood, and some days afterward solemnly consecrated pope with the title of Gregory VII., a name which he chose in testimony of his veneration for the memory and character of his earliest patron, Gregory VI.

Once more firmly established on the papal throne, Gregory lost no time in giving the utmost possible practical effect to the two leading ideas of his life: the establishment of the supremacy of the papacy within the church and the effective assertion of the supremacy of the church over the state. Regarding as the great evil of his time the thoroughly secularized condition of the church in a great part of Europe, and especially in Germany and northern Italy, he directed against this all his efforts.

The position occupied by the higher clergy as feudal proprietors, the right of investiture which was claimed by the crown, the consequent dependence of the clergy upon the sovereign, and the temptation to simony which it involved, were, in the mind of Gregory, the cause of the evils under which Europe was groaning. Of all these, he regarded investiture as the fountain and the source. While, therefore, he labored by every species of enactment, by visitations, by encyclical letters, and by personal exhortations, precepts, and censures, to enforce the observance of all the details of discipline — celibacy, the residence of the clergy, the instruction of the people — and to repress simony, it was against the fundamental abuse of investiture that his main efforts were directed.

In March, 1074, a synod was held in Rome which condemned the simony that had grown so prevalent throughout the church, and also enacted the old stringent laws of celibacy which had become almost a dead letter, especially in Germany and in the north of Italy. Simoniacal or married priests were declared to be deposed and their priestly functions invalid. The resistance of the clergy to these decrees was utterly in vain; papal legates visited every country, and, supported by the popular voice, compelled submission. At a second synod it was determined that any ecclesiastic who in future should accept office from the hands of a layman incurred the penalty of deposition, while the secular lord who bestowed investiture was to be excommunicated. The decree was aimed immediately at certain German bishops, Henry's personal advisers, but hardly less directly at Henry himself.

The emperor, finding his hands at the moment fully occupied with the suppression of a revolt among the Saxons, was politic enough to conceal his resentment for a time, and to dismiss his advisers. As soon as the war had been brought to a close, however, his defiance found ample expression. Meanwhile Gregory was not unopposed even in Italy, and during the Christmas festivities of 1075 a revolt in Rome itself was organized by Cencius, who had placed himself at the head of those nobles who were opposed to reform. But the pope had the popular enthusiasm on his side, and ultimately the insurgents were compelled to fly.

A papal embassy was next sent, early in 1076, to Henry at Goslar, citing him to appear personally at Rome, at a council to be held in the second week of Lent, and there answer for his simony, sacrilege, and oppression. Henry's rage at this knew no bounds; he dismissed the legates with insult, and at a diet held at Worms, in January of that year, he replied by declaring Gregory deposed on the ground of tyranny, magic, and other charges, by sending notification of this fact to the Roman clergy, and by taking steps for appointing a successor to the dethroned pontiff. Gregory now lost no time in excommunicating all the bishops who had attended the diet of Worms, in solemnly deposing and excommunicating the emperor, and in absolving his subjects from their oath of allegiance.

This counteraction produced a powerful effect upon the German princes and people, many of whom had good cause to resent Henry's tyrannies. One by one the bishops who had announced their withdrawal from Gregory's obedience now signified their contrition, and at a diet held at Tribur, in September, 1076, the election of a new emperor began to be discussed. Resistance being in the meantime impossible, Henry resolved upon humbling himself to the utmost. In the dead of winter he set out to make his submission. Gregory was in waiting for him at Canossa, where, from January 25 to 27, 1077, that famous penance which Europe has not yet forgotten was imposed.

Absolved only on condition that he would not assume the royal dignity until his case had been investigated and decided, Henry had no sooner left the papal presence than he began to plot his revenge. His submission was only feigned; and upon his subsequent triumph over his rival, Rudolf of Swabia, Henry resumed hostilities with the pope. In 1080 he was again declared deposed, and reciprocated by appointing the anti-pope, Guibert, archbishop of Ravenna, under the name of Clement III. With a powerful army, the emperor proceeded to escort Guibert to Rome. In three successive summers the attack on Rome was renewed, but it was not until March, 1084, that the treachery of some of the nobles of the city opened the gate to the invader. Gregory was now, at last, compelled to take refuge in the castle of St. Angelo, where he was besieged by Henry's forces, while Guibert was established on the pontifical throne as his successor. After receiving coronation from Clement, Henry determined to return at once to Germany, especially as

Robert Guiscard was known to be approaching. Released, accordingly, by the arrival of the Norman duke, Gregory excommunicated once more both Henry and Clement. The wretched condition to which Rome was now reduced, obliged Gregory to withdraw first to Monte Cassino, and ultimately, in May, 1084, to place himself under Robert's protection at Salerno, where he died, May 25, 1085, after a comparatively brief pontificate of not much more than ten years. His last words are a deeply affecting, yet a stern and unbending profession of the faith of his whole life, and of the profound convictions under which even his enemies acknowledge him to have acted: "I have loved justice and hated iniquity; therefore, I die in exile."

Gregory's career lay in the first of the three centuries which fulfilled the maturity of Catholicism. He found the field prepared by the labors of a thousand years. The doctrine and worship of the church were almost complete, awaiting their last perfections, the paramount adoration of the Virgin and the glory of sacred art. The ranks of the clerical order, including the monastic class, were fully established and their normal functions prescribed. The West was relieved from the interference of the Eastern church and court, and from further northern invasions; the feudal system was taking shape as the common polity; the Catholic faith prevailed without rival everywhere, the pagan shores of the Baltic and Moorish Spain excepted; and the papacy was enthroned in the sacred city of the world, furnished with potent title-deeds, and endowed with an ample patrimony under the nominal protection of a holy Roman emperor and all Christian princes: the pope's divine commission was undoubted, though its limits were undefined. It was Gregory's province to define them. In Gregory's conception of the constitution of Christian society, the spiritual power was the first and highest element. It was to direct, to command the temporal, and, in a certain sense, to compel its obedience; but the arms which it was authorized to use for the purpose of coercion were the arms of the spirit only. In other words, his aspiration was to subordinate politics to morals; and to this end he devoted his unbending efforts to suppress the vices which deformed society, and to restrain the tyranny which oppressed the subject as much as it enslaved the church.

The theory of church polity which he thus represented is differently judged by the different religious schools; but it is confessed by all, even by those who now most vehemently reject it, to have been grand in its conception, and unselfish in its object.

"The theory of Augustine's 'City of God,'" says Milman, "no doubt swam before his mind, on which a new Rome was to rise and rule the world by religion." But so exalted and imperial a design, opportune and necessary as it was, could not be carried out far enough to realize the Christian dream for universality. Its partial success, and the noble effort back of it availed to promote the humanizing career of Catholicism. It strengthened the hand of every spiritual authority in Christendom down to the humblest parish priest, and with it the church continued to advance in plenary power, and general utility. Moreover, whatever may be said of the power in itself, or of the length to which it has at times extended, the occasion and the object of its exercise in the hands of Gregory were always such as to command the sympathy of the philosophical student of the history of the middle ages. He taught his age "that there was a being on earth whose special duty it was to defend the defenseless, to succor the succorless, to afford a refuge to the widow and orphan, and to be the guardian of the poor."

The life work of Gregory may be thus summed up in the words of Sir James Stephen: — "He found the papacy electoral by the Roman people and clergy; he left it electoral by a college of papal nomination. He found the emperor the virtual patron of the holy see; he wrested that power from his hands. He found the secular clergy the allies and dependants of the secular power; he converted them into the inalienable auxiliaries of his own. He found the higher ecclesiastics in servitude to the temporal sovereigns; he delivered them from that yoke to subjugate them to the Roman tiara. He found the patronage of the church the mere desecrated spoil and merchandise of princes; he reduced it within the dominion of the supreme pontiff. He is celebrated as the reformer of the impure and profane abuses of his age; he is more justly entitled to the praise of having left the impress of his own gigantic character on the history of all the ages which have succeeded him."

The victories of the church were his joys; her defeats, his sorrows.

ST. FRANCIS OF ASSISI

A. D.		AGE
1182	Born at Assisi, Italy, ...	. .
1206	Made a pilgrimage to Rome, and vowed himself to poverty and religion, ...	24

1219	First general assembly, ...	37
1223	Order confirmed by Pope Honorius, .	41
1226	Died near Assisi, ...	44

ST. FRANCIS of Assisi, founder of the celebrated Franciscan order, and who represented, in his life, "the might and majesty of self-sacrifice," was born at Assisi, near Perugia, in Italy, in the year 1182. His baptismal name was GIOVANNI FRANCESCO BERNARDONE, and his father, Pietro Bernardone, was a rich merchant. His mother belonged to a noble family of Provence, in the south of France, and was a woman of marked piety.

At the early age of fourteen, Francis engaged in his father's business, which brought him into close trade relations with the people of southern France, and he soon became familiar with both the language and the romances of the French troubadours. He was a youth of high spirit and natural enthusiasm, which was matched with a remarkable love of gayety and prodigality; but even then his bounty to the poor was one of the largest sources of his wastefulness. He engaged eagerly in exercises of chivalry and of arms; and in one of the petty feuds of the time he was taken prisoner, and detained for a year in captivity at Perugia.

An illness which he contracted during his confinement in prison turned his thoughts from earth, and forced on him those first religious musings which created within him a profound desire to put on a new life. He returned to military pursuits, however, until a second illness at Spoleto decided his career for life. He now resolved to fulfill literally the counsels of the gospel, and under an impulse which he received while listening to a sermon he took a vow never to refuse alms to a beggar. In 1206, when twenty-four years of age, he made a pilgrimage to St. Peter's, in Rome, and thereafter he renounced his inheritance, broke from his family, and consecrated himself to religion and to poverty — which latter, in the mystic language thenceforth familiar to him, he designated as "his bride."

On his return to Assisi, Francis exchanged his clothes with a poor mendicant, and, disregarding all remonstrance and ridicule, he ever afterward continued to wear the meanest attire. He gave to a priest, who was rebuilding a ruined church, the price of his horse which he sold for the purpose, and even sought to appropriate to the same use some of his father's money, which, however, the priest refused to accept. To avoid his father's anger, he took refuge in a cave, in which he spent a month in solitary prayer, and from which he returned more than ever confirmed in his enthusiasm.

His father now confined him — but in vain — in a dark room of his own house, and cited him before the magistrates to compel him to renounce his inheritance before he should devote it to such purposes as his religious enthusiasm would suggest. Francis declined, however, to recognize any civil jurisdiction in the matter, and it was then brought by his father before the bishop, upon which occasion the gentle ascetic renounced his entire patrimony, even to the clothes he wore. "Until now," Francis declared, "I have been the son of Bernardini, but, henceforth, I have but one Father, Him that is in heaven."

Thereafter, no humiliation, no self-sacrifice, was too extreme for Francis. He begged at the gates of monasteries; he discharged the most menial offices; he served the lepers in the hospital at Gubbio in their most revolting necessities, and with the tenderest assiduity. He worked with his own hands at the building of the church of St. Damian, and at that of Sta. Maria degli Angeli, which he afterward called his "Portiuncula," or "little inheritance"; and as the last act of self-spoliation, and the final acceptance of the gift of poverty, he threw aside his wallet, his staff, and his shoes, and arrayed himself in a single brown tunic, of coarse woolen cloth, girt with a cord of hemp. This was in his twenty-sixth year, in 1208; and from this year the foundation of the Franciscan order actually dates. His enthusiasm by degrees excited emulation. Two of his fellow townsmen, Bernard Quintavalle and Peter Cattano, were his first associates. They were followed, although slowly, by others. In 1210, when his brotherhood had increased to eleven in number, he drew up for them a rule, selected in the true spirit of religious enthusiasm, by thrice opening at random the gospels upon the altar, and taking the passages thus indicated as the basis of the young religious order.

The new brethren repaired to Rome, where their rule was approved *viva voce* by Pope Innocent III. in 1210. The two following years were spent by the brotherhood in preaching and exhorting the people through the rural districts of their native and the adjoining provinces. Francis himself returned to Assisi in 1212, at which time he finally settled the simple constitution of his order, the church of Sta. Maria degli Angeli being assigned to them as their home. In common with the older forms of monastic life, the Franciscan order was founded on the three vows of chastity, poverty, and obedience; but of these the second was, in the eyes of Francis, the first in importance and in spiritual efficacy. In other orders, the practice of poverty consisted in the mere negation of riches. With Francis it was an active and positive principle. In other orders, although the individuals could not possess, it was lawful for the community to hold property in common. Francis repudiated all idea of property, alike for his order and for its members. He even disclaimed for them the property in those things which they retained for personal use — the clothes which they wore, the cord with which they were girded, the very breviary from which they chanted the divine office. The very impossibility to human seeming of these vows was their strength.

The passionate fervor, mystic tenderness, and martyr-like self-abandonment of the new order spread with irresistible contagion over Europe. Numbers crowded to the standard of Francis. They were divided into various grades of both sexes. Whole cities enrolled themselves among his followers. He sent them off in parties to different provinces of Italy. Five of the brotherhood repaired to Morocco to preach to the Moors, and, as the first martyrs of the order, fell victims to their holy daring. Success removed all the hesitation with which the order was at first regarded, and in 1216 the order was solemnly approved by Pope Innocent. From this date it increased with extraordinary rapidity. At the first general assembly, held in 1219, five thousand members were present; five hundred more were claimants for admission.

After the order had been confirmed in 1223 by Pope Honorius, Francis himself inaugurated the future missionary character of his brotherhood by going to the East, and preaching the gospel in the presence of the sultan himself. But the only fruit of his mission was a promise from the sultan of more indulgent treatment for the Christian captives, and, for the Franciscan order, the privilege which they have since enjoyed, as guardians of the church of the Holy Sepulchre.

It is after his return to Italy that his biographers place the celebrated legend, which, to friends or to enemies, has so long been a subject of veneration or of ridicule — his receiving, while in an ecstasy of prayer, the marks (stigmata) upon his own person of the wounds of our divine Redeemer. The scene of this event is laid on Monte Alverno, a place still sacred in the traditions of the order; and the date is September 17, 1224. Two years later, after a short but intense career of passionate preaching, and mystical self-torment, in which his almost fanatical zeal disappears in a halo of sweetness and simplicity, St. Francis died, near Assisi, October 4, 1226. On the approach of his last hour, he requested that he should be carried upon a bier to the church, where he had himself placed on the bare ground, thus realizing in his own death the most literal extreme of the doctrine which he had made in life the basis of his system. He was canonized by Pope Gregory IX. in 1228.

For a season after his death the exquisite pathos of his life and nature, and the beauty of the religious virtues which he taught, created a genuine revival of purity and zeal from one end of the mediæval church to the other. Christendom was filled with the gray friars, and the mendicant order embraced in its ranks many saints, martyrs, sovereigns, and illustrious men and women, and filled for some centuries the poetry and art of the middle ages.

The published writings of St. Francis that have come down to us consist of letters, sermons, ascetic treatises, proverbs, moral apothegms, and hymns. The latter are among the earliest metrical specimens of the Italian language. They are exceedingly simple, and full of the tenderest expressions of the love of God. His prose is often more poetical than his poetry itself, abounding in allegory and poetical personification. Few writers have ever turned the love and admiration of external nature to a purpose so beautifully devotional; for St. Francis even "claimed brotherhood with sun and wind, and hailed the last pale visitor as Sister Death."

Within half a century after the death of St. Francis, the number of Franciscans was estimated at about two hundred thousand, with eight thousand convents in twenty-three provinces. The simplicity of the rule left room for the greatest variety of opinions. This showed itself during the lifetime of the founder, one party wishing to have the vow of poverty mitigated, the other strenuously opposing any such change. At the election of almost every new general we find the two parties in competition, the popes themselves sometimes siding with the one, sometimes with the other.

Numerous secessions took place, but none were permanently successful until the undertaking of Paoletto di Foligno, in 1368, to restore the strict observance of the rule. His followers were called observants, and those who adhered to the milder rule, conventuals. Henceforth, these two names distinguished the two great parties. Notwithstanding the desire of the pope that no further separations should occur, several congregations arose, styled minorites of the stricter observance, and, though forming separate provinces from the main body of the regular observants, were always under the same general. They were called Alcantarines in Spain from St. Peter of Alcantara, reformed in Italy and Germany, and recollects in France, England, Ireland, Belgium, and Holland. The Capuchins, originally a congregation of reformed Franciscans, became afterward an independent order.

St. Francis also established an order of nuns, who are generally called from its first abbess, Clara of Assisi, poor Clares or Clarisses. Another branch were the tertiarians or penitents of the third order of St. Francis. The habit of the observants consists of a cowl, a cord as a girdle, and sandals. Its color differs in different localities. In England and Ireland it is gray, whence they were called gray friars.

Early in the eighteenth century, the Franciscans numbered nearly one hundred twenty thousand friars, with seven thousand houses, and some thirty thousand nuns, with nine hundred convents. These numbers were considerably reduced after the French revolution, but the order remains even now one of the strongest of the Roman Catholic church.

The supreme government of the Franciscan order, which is commonly said to be the especial embodiment of the democratic element in the Roman Catholic church, is vested in an elective general, who resides at Rome. The subordinate superiors are, first, the "provincial," who presides over all the brethren in a province; and secondly, the "guardian," who is the head of a single convent or community. These officers are elected for only two years. The provincial alone has power to admit candidates, who are subjected to a probation of two years, after which they are, if approved, permitted to take the vows of the order. Those of the members who are advanced to holy orders undergo a preparatory course of study, during which they are called "scholars"; and, if eventually promoted to the priesthood, they are styled "fathers" of the order; the title of the other members being "brother" or "lay brother."

A very important feature, however, of the organization of the Franciscan, as it subsequently became of other orders, is the enrollment of non-conventual members, who continue to live in society without the obligation of celibacy, and in general are bound only by the spirit, and not by the letter of the rule. These are the tertiarians, or members of the third order of St. Francis.

It is impossible to overestimate the value of this institution in the disorganized social condition of that age. The tertiarians were bound, as the very first condition of enrollment, to restore all ill-gotten goods; to be reconciled with all those with whom they had been at feud; to devote themselves to the practice of works of Christian charity; to avoid all unnecessary expenditure; to renounce the use of personal ornaments; to hear mass daily; to serve the sick and the hospitals; to instruct the ignorant; and, in a word, to practice as far as possible in the world the substance of the virtues of the cloister. The order in this form undoubtedly exercised a very powerful influence in mediæval society. It counted members in every rank, from the throne to the cottage; and, although it was in some instances deformed by abuses and superstitious practices, the aggregate results were undoubtedly beneficial in the extreme.

As a literary order, the Franciscans have chiefly been eminent in theology. The great school of the Scotists takes its name from John Duns Scotus, a Franciscan friar, and it has been the pride of this order to maintain his distinctive doctrines both in philosophy and in theology against the rival school of the Thomists, to which the Dominican order gave its allegiance. Indeed, all the greatest names of the early Scotist school are Franciscans — St. Bonaventure, Alexander of Hales, and Occam. The single name of Roger Bacon, the marvel of mediæval letters, the divine, the philosopher, the linguist, the experimentalist, the practical mechanician, would in itself have sufficed to make the reputation of his order, had his contemporaries not failed to appreciate his merit. Two centuries later the great Cardinal Ximenes was a member of this order. The popes Nicholas IV., Alexander V., Sixtus IV., the still more celebrated Sixtus V., and the well-known Ganganelli, Clement XIV., also belonged to the order of St. Francis. In history, this order is less distinguished; but its own annalist, Luke Wadding, an Irish Franciscan, bears a deservedly high reputation as a historian. Jacopone da Todi, author of *Stabat Mater*, a Franciscan, is one of the most celebrated of the mediæval hymn-writers; and in later times the distinguished Lope de Vega closed his eventful career as a member of the third order of St. Francis.

The Franciscans were the earliest missionaries to America, having come over with Columbus on his second voyage in 1493. The recollects figured largely in the missionary history of Canada for many years, and the historic explorer, Hennepin, was also a missionary of the Franciscan order.

Dante, in his *Paradiso*, tells us that the divine foresight ordained for the church two princes to be her guides, one on each side. The one — St. Francis — was all seraphic in ardor; the other — St. Dominic — was a cherubic light of wisdom on earth. He also makes St. Thomas Aquinas pronounce a noble eulogy on St. Francis, in recognition of the fundamental harmony of their souls.

In our own time, no one, perhaps, has more keenly appreciated this seraphic guide than Canon Farrar. "Of all the men who have ever lived," he says, "there is probably no one who has ever made it so absolutely his aim, as did St. Francis, to reproduce in letter as well as in spirit the very life of Christ. Among the villages and hills of Umbria he strove to live with his few first followers the very same life that our Lord had lived with His apostles on the shores of Galilee and in the villages of Palestine."

In addition to this, observes Maccall: "It would be absurd to claim such men as St. Francis for one church or religion more than another. They are the property of the universal human race. What was most beautiful in Jeremy Taylor, what was sweetest in Fenelon, what was profoundest in Jacob Böhme, what was purest in Oberlin, what was bravest in Chalmers, had so clearly the mark of God, that a sad and sinful thing it would be if the pride of sects were to make a monopoly thereof. God's apostles are for the world; and let all the world bow down in honor, in gratitude, and in praise for a blameless and gentle saint like St. Francis."

LUTHER

A. D.		AGE
1483	Born at Eisleben, Prussian Saxony,	..
1505	Graduated from university of Erfurt; entered Augustine monastery,	22
1507	Ordained priest,	24
1508	Professor of philosophy at Wittenberg,	25
1511	Visited Rome,	28
1517	Published theses on indulgences,	34
1519	Controversy with Dr. Eck; appealed to general council,	36

A. D.		AGE
1520	Leo X. issued bull against him,	37
1521	Excommunicated by Leo X.; began version of Bible,	38
1522	Translation of new testament published,	39
1525	Introduced reformed worship at Wittenberg; married,	42
1530	Diet at Augsburg,	47
1546	Visited Eisleben; died at Eisleben,	63

MARTIN LUTHER, the greatest of the German Protestant reformers, and translator of the Bible, was born at Eisleben, in Prussian Saxony, on St. Martin's eve, November 10, 1483; and, from the day upon which he was born, received the name, Martin. His father was a poor miner, and his mother a woman of exemplary virtues. Shortly after the birth of their son, his family left Eisleben for Mansfeld. Here Martin was sent to school; and both at home and in school his training was of a severe and hardening

character. His father sometimes whipped him, he says, "for a mere trifle until the blood came," and he was subjected to the scholastic rod fifteen times in one day!

Scholastic and parental severity was the rule in those days; but whatever may have been the character of Luther's schoolmaster at Mansfeld, there is no reason to believe that his father was a man of exceptionally stern character. While he whipped his son soundly, he also tenderly cared for him, and was in the habit of carrying him to and from school in his arms with gentle solicitude. Luther's elementary education was completed at Magdeburg and Eisenach, and at the latter place he gained the favor of a good foster-mother by the name of Cotta, who provided him with a comfortable home during his stay there.

Meanwhile, Luther's father had advanced from a hardy laborer in the mines to owner of a couple of blast furnaces, and this prosperous condition enabled him to still further aid the son's education. He was anxious that his son should study law, and Martin entered the university of Erfurt in 1501. The fashionable scholastic philosophy occupied him here for a series of years, and the whole university admired his genius. During the second year of his studies at Erfurt, while ransacking the college library and devouring its volumes, he found a copy of the Latin Bible, a book he had never seen before. This, too, he read with his usual avidity, and found to his astonishment that there were more gospels and epistles than in the lectionaries. His heart was deeply touched, and there was awakened within him apparently a new spiritual life. He continued his studies with great zeal, and was graduated with a master's degree in 1505.

Not long afterward his severe studies produced an alarming illness, which brought him face to face with death, and created serious and permanent religious impressions, which were so deepened by the death of a very intimate friend and fellow student by a stroke of lightning that he at once resolved to become a monk, and leaving all his property behind him, except a Vergil and a Plautus, and giving his astonished friends a hearty farewell banquet, he entered the monastery of the hermits of St. Augustine.

Here he spent the next three years of his life — years of peculiar interest and significance; for it was during this time that he laid, in the study of the Bible and of St. Augustine, the foundation of those doctrinal convictions which were afterward to rouse and strengthen him in his struggle against the papacy. He describes very vividly the spiritual crisis through which he passed, the burden of sin which so long lay upon him, "too heavy to be borne"; and the relief that he at length found in the clear apprehension of the doctrine of the "forgiveness of sins" through the grace of Christ.

In the year 1507 Luther was ordained a priest, and in the following year he removed to Wittenberg, destined to derive its chief celebrity from his name. He became a teacher in the new university, founded there by the elector Frederick of Saxony. At first, in 1508, he lectured on dialectics and physics, but his heart was already given to theology, and in 1509 he became a bachelor of theology, and commenced lecturing on the holy scriptures. His lectures made a great impression, and the novelty of his views already began to excite attention. "This monk," said the rector of the university, "will puzzle our doctors, and bring in a new doctrine." Besides lecturing, he began to preach with a vigor, impetuosity, and eloquence that soon attracted immense crowds. His sermons, therefore, reached a wider audience, and produced a still more powerful influence than his lectures. His words, as Melanchthon said, were "born not on his lips, but in his soul," and they moved profoundly the souls of all who heard them.

In 1511 he was sent on a mission to Rome, and he has described very vividly what he saw and heard there. His mind suffered a severe shock when he witnessed the religious conditions in the Italian metropolis, and "caused the veil to fall from his eyes." Yet his devout and unquestioning reverence — for he was yet in his own subsequent view "a most insane papist" — appears in strange conflict with his awakened thoughtfulness and the moral indignation at the abuses of the papacy beginning to stir in him.

After Luther's return from Rome to Wittenberg, 1512, he was made a doctor of theology, and his career as a reformer may be said to have commenced. The abuse of indulgences in Saxony had reached a scandalous height. The idea that it was in the power of the church to forgive sin had gradually grown into the belief that their dispensation to the faithful exonerated them from the consequences of their transgressions. The sale of these pardons had become organized into a system by the zealous John Tetzel, a Dominican friar, who had established himself at Jäterboch, on the borders of Saxony. Indeed, some of the people of Wittenberg, who had confessed to Luther, refused to abandon their sins, and pleaded the indulgences which they had bought.

The spirit of Luther was fired — the spark was laid to the train which ended in a mighty explosion. He preached and remonstrated, and on October 31, 1517, nailed to the door of the Castle church at Wittenberg his celebrated ninety-five theses, and sent a copy of them to the archbishop of Magdeburg. The consequent discussions with Tetzel at Wittenberg, and his debates upon the same subject at Heidelberg, only increased and deepened the agitation, and added to Luther's popularity. He now devoted himself to the study of church history and canon law to support the course he had taken. At the same time he wrote popular religious tracts, among them an "Exposition of the Ten Commandments," and of the "Lord's Prayer." He gained the support of Bucer and Melanchthon in 1518, thenceforth two of his most distinguished co-reformers, and elaborated his theses into a body of resolutions.

Meanwhile, Tetzel retreated from Saxony to Frankfort-on-the-Oder, where he published a set of countertheses, and burned those of Luther. The students at Wittenberg retaliated by burning Tetzel's. By and by Luther was summoned to Rome by Pope Leo X., and ordered to appear and answer for his theses at Augsburg, before the papal legate, Cardinal Cajetan. At the several interviews he stood firm and resolved, and returned in triumph to his cell and his lecture-room in Wittenberg.

The excitement was now so prodigious that the courteous elector of Saxony wished him to leave the city, and Luther at last appealed from the pope to a general council. But Miltitz, another legate, was appointed, and, at a meeting which took place at Altenburg, Luther was led to write a humble and apologetic letter to Leo. The letter was unheeded by the reformer himself, however, and he almost immediately plunged into a disputation with Dr. Eck at Leipzig in 1519, known in history as the Leipzig disputations. He also hurled several violent and effective pamphlets against the doctrinal system of the Roman church, and issued his famous address to the Christian nobles of Germany. These works found a wonderful and immediate circulation. Erasmus and Hutten now joined the conflict. Germany was convulsed with excitement. Eck fled from place to place, glad to escape with his life, and Luther was everywhere the hero of the hour.

Pope Leo X. was disposed at first to treat the subject lightly; but he was at last compelled to issue, June 15, 1520, a bull of excommunication against Luther, if he should not recant within sixty days. The papal bull, containing forty-one theses issued against him, Luther burned before a multitude of professors, students, and citizens in Wittenberg.

Luther's separation from the Roman church was complete in 1521. Charles V. was anxious to apprehend and punish the turbulent and daring reformer, but by the influence of the elector of Saxony his cause was tried at Worms. On his way to Worms, Spalatin, apprehensive for his safety, despatched a messenger to forewarn and dissuade him from continuing his journey, but the magnanimous champion replied, "Go tell your master, that though there were as many devils in Worms as tiles upon the housetops, I will enter it." On April 16th he reached the city, attired in his friar's cowl; multitudes met him and he entered it attended by two thousand persons. Before his three hundred four august judges, the emperor and his nobility, his courage did not fail. He entered upon an elaborate vindication of his past procedure, and steadily appealed to the authority of the scripture. "Unless I be convinced," he said, "by scripture and reason, I neither can nor dare retract anything, for my conscience is a captive to God's word, and it is neither safe nor right to go against conscience. There I take my stand. I can do no otherwise. So help me God."

On his return from Worms, Luther pursued the road that led to Möhra, that he might see his aged grandmother. But when he resumed his journey the next day, and was passing through the depths of the Thuringian forest, he was roughly seized by five horsemen, and carried to the castle of Wartburg, and a whole year he lay there in solitude, while his friends mourned his absence or death. But his powerful patrons had in this way provided for his safety. This period of forced retirement was not misspent. Within the year he made a German translation of the new testament which was published in 1522. He also wrote various treatises, and injured his health by sedentary habits and hard study. His imagination became morbidly excited, and he thought he heard and saw the evil one mocking him while engaged in his literary tasks. On one occasion he hurled his inkstand at the intruder, and made him retreat. The subject of the personality and presence of Satan was a familiar one with Luther, and he frequently refers to it in his "Table Talk."

In 1522 the outbreak of serious disturbances among his own followers induced him to return to Wittenberg, where he rebuked the unruly spirits who had acquired power in his absence, and resumed with renewed energy his interrupted work. The reformation was now properly ushered in, and at no period of his life did he take a nobler stand than that which he took at this time against lawlessness on the one hand and tyranny on the other.

His next act of importance was by no means so commendable. Although he had been at first united in a common cause with Erasmus, estrangement had gradually sprung up between the great scholar of Rotterdam and himself. This estrangement came to an open breach in the year 1525, when Erasmus published his treatise "On the Freedom of the Will." Luther immediately followed with his countertreatise "On the Servitude of the Will." The controversy raged loudly between them; and in the vehemence of his hostility to the doctrine of Erasmus, Luther indulged in assertions of a very questionable kind, besides indulging in wild abuse of his opponent's character.

In the same year — 1525 — Luther was married by Pomeranus to Katharina von Bora, one of the nine nuns, who, under the influence of his teaching, had left the convent about two years before. She was a woman of noble family, and, although fifteen years younger than he, proved a kind and affectionate wife. The step rejoiced his enemies, and even alarmed some of his friends like Melanchthon. But it greatly contributed to his happiness, while it served to enrich and strengthen his character. All the most interesting and touching glimpses we get of him henceforth are in connection with his wife and children.

Two years after his marriage he fell into a dangerous sickness and depression of spirits, from which he was only aroused by the dangers besetting Christendom from the advance of the Turks. Every year, almost, saw him publish a book or books. The translation of the Bible had occupied a large portion of his time, for it was the mainstay of the reformation; and commentaries on almost all the books of the Bible proceeded from his unwearied pen. Councils were in those days reckoned a grand specific for healing ecclesiastical discord, and there were not a few in the life of Luther: Worms in 1521, Nuremburg in 1522-23, when the German princes presented a list of "a hundred grievances"; another at the same place in the following year, at which the members resolved to work out as far as possible the decisions of that of Worms; and that of Augsburg in 1525, adjourned to Spires in 1526, at which a general council was demanded. Another diet was convoked to meet in February, 1529, and the imperial party having the mastery, decreed to suppress the reformation by force. Against this decree the deputies solemnly *protested*, and the reforming band received from this circumstance the appropriate name of *Protestants*. Luther and Zwingli now quarreled about the nature of the Lord's Supper, and maintained a worse than idle contest, even meeting personally for disputation at Marburg. The diet of Augsburg met in 1530, the confession prepared by Melanchthon was submitted to it, and Protestantism, in spite of all obstacles, was firmly established among the German nations.

From this time on the life of Luther has comparatively little interest. He continued to reside at Wittenberg during his remaining years. In his sixty-second year his health began to give way, and the strong man was bowed down. After an altercation with the lawyers about clandestine marriages, and certain female fashions in dress, he indignantly left Wittenberg for Eisleben in the month of January, 1546. The river Issel being swollen, he was five days upon the road. On February 17th, after reaching Eisleben, he complained of oppressive pain in his chest. Momentary relief from it was soon obtained; but he was again attacked in the night, and after brief but earnest religious exercises, and thrice repeating the inspired words, "Into Thy hands I commit my spirit — God of truth Thou hast redeemed me," he expired between two and three o'clock in the morning. His disease is supposed to have been *angina pectoris*, but some say, cancer of the stomach.

He was buried in the Schloss-Kirche, or court church, in Wittenberg.

Luther was a man of short stature, compact physical frame, with broad shoulders, a large and massive brow, a firm-set mouth, and falcon eyes. His voice was clear and of great power. Melanchthon is said to have exclaimed upon beholding his picture, "Each of thy words was a thunderbolt." Yet he was a man of loving and generous heart — playful and happy with his wife and family or friends. He liked hilarity, and his great mind rejoiced to unbend.

He was very fond of music, and had great capabilities for it. He sedulously studied its theory, and wrote many hymns and set them to music; and may be regarded as the founder of German hymnology and music. His most famous hymn, *Ein feste Burg ist unser Gott*, the war song of the reformation, was written in 1529 on the basis of the 46th psalm.

But amidst all his literary labors his translation of the Bible stands preëminent. Fully aware of the difficult and responsible task, he craved assistance in every form and from every available quarter. When the Hebrew terms belonging to botany and zoölogy perplexed him, he consulted the physician, Sturciad, and he also obtained useful information from his friend, Spalatin, who not only instructed him in natural history, but sent him specimens from the superb collection of gems which belonged to the elector of Saxony. He even employed butchers to dissect animals in his presence, that he might be able to discriminate and render accurately the various sacrificial terms of the Levitical code. But especially did he summon erudite and skilled professors of theology to his aid. They met from time to time, each having prepared himself for the interview by a thorough elaboration of the literary materials belonging to his department of investigation.

At those repeated and prolonged consultations Luther invariably presided, and he had always spread out before him his own manuscript, the ink of which was scarcely dry, the Hebrew Bible, and the Latin vulgate. On his one hand sat Melanchthon, with the Greek scriptures before him, and on his other was placed Casper Cruciger, with his notes made from the Chaldee Targums. Bugenhagen, usually called Pomeranus, from the country of his birth, was also by their side, ready with his suggestions from the rabbinical writings and the old Greek versions. These scholars did their work with marvelous precision and fidelity, for they sometimes returned fourteen successive days to the reconsideration of a doubtful clause or word.

His other works are very voluminous, partly in Latin, and partly in German. Among those of more general interest are his "Table Talk," his "Letters," and "Sermons."

The two great branches of the Christian church quite naturally take widely divergent views of Luther and his work. To the one he is a great religious hero; to the other, a schismatic, a heretic, and a defiant controversialist. To affirm either one of these views, and deny the other, is not within the contemplation of this sketch. All will agree that Luther was an extraordinary man — earnest, courageous, sincere.

His character presents, indeed, an imposing combination of great qualities. That he sometimes spoke roughly and wrote harshly, no one better knew than himself. Endowed with broad human sympathies, massive energy, manly and affectionate simplicity, and rich, if sometimes coarse, humor, he is at the same time a spiritual genius. His intuitions of divine truth were bold, vivid, and penetrating, if not comprehensive; and he possessed the art which God alone gives to the finer and abler spirits that He calls to do special work in this world, of kindling other souls with the fire of his own convictions, and awakening them to a higher consciousness of religion and duty. He was a leader of men, therefore, and a reformer in the highest sense. His powers were fitted to his appointed task; it was a task of Titanic magnitude, and he was a Titan in intellectual robustness and moral strength. It was only the divine energy which swayed him, and of which he recognized himself the organ, that could have accomplished what he did.

Reckoned as a mere theologian, there are others who take higher rank. There is a lack of patient thoughtfulness and philosophical temper in his doctrinal discussions; but the absence of these very qualities gave wings to his bold, sometimes crude conceptions, and enabled him to triumph in the struggle for life or death in which he was engaged. To initiate the religious movement which was destined to renew the face of Europe, and give a more enduring life to the Saxon nations, required a gigantic will, which, instead of being crushed by opposition, or frightened by hatred, should only gather strength from the fierceness of the conflict before it. To clear the air thoroughly, as he himself said, thunder and lightning are necessary; and he was well content to represent these agencies in the great work of the reformation in the sixteenth century. Upon the whole, it may be said that history presents few greater characters — few at once that excite more love and admiration, and in which we see tenderness, humor, and a certain picturesque grace and poetic sensibility more happily combine with a lofty and magnanimous, if sometimes rugged sublimity.

Carlyle in his *Heroes and Hero-Worship* has probably struck the truest keynote to Luther's greatness. "I call this Luther a true-great man; great in intellect, in courage, affection, and integrity; one of our most lovable and precious men. Great, not as a hewn obelisk; but as an Alpine mountain — so simple, honest, spontaneous, not setting up to be great at all; there for quite another purpose than being great!"

LOYOLA

A. D.		AGE
1491	Born at castle of Loyola, Guipuzcoa, Spain,	
1505	Entered court of Ferdinand V., as page,	14
1521	Wounded in defense of Pamplona,	30
1522	Resolved to devote himself to the church,	31
1523	Visited Rome and Jerusalem,	32
1526–27	Studied at universities at Alcalá and Salamanca,	35–36
1527	Imprisoned during inquisition at Salamanca,	36
1528	Liberated; went to Paris, and entered the university,	37
1534	Master of arts from university of Paris; founds order of Jesuits,	43
1536–37	Order promoted at Venice and Rome,	45–46
1541	Elected general of the order,	50
1548	Published his *Exercitia Spiritualia* or "Spiritual Exercises"; and "Constitution of the Order,"	57
1556	Died at Rome,	65

IGNATIUS DE LOYOLA is the name by which history knows INIGO LOPEZ DE RECALDE, celebrated Spanish reformer and founder of the order of Jesuits. He was the youngest son of Bertram de Recalde, a Spanish nobleman, and Marina Salez de Baldi, and was born at the ancestral castle of Loyola, in the Basque province of Guipuzcoa, Spain, in 1491. He inherited an ardent, imaginative temperament, and in his youth was a votary of chivalrous romance, such as inspired the pen of Cervantes.

After the scant training of that age in letters, and destined to the profession of arms, Ignatius was sent, at the age of fourteen, to the court of Ferdinand V. to learn the rudiments of war and gallantry. The restraint and inactivity of the court, however, were repellent to his natural enthusiasm. He desired and sought activity; and, under the auspices of his relative, the duke of Najura, he entered upon that military career, which subsequently proved the turning point of his life.

The details of his career as a soldier are of little importance in his history, although they display in a very marked degree both the excellency and the irregularities of his temperament, thrown indirectly among the temptations as well as the duties of a military life. Of his bravery and chivalrous spirit many remarkable instances are recorded, chief of which, perhaps, was his bearing at the defense of Pamplona against the attack of the French in 1521. On this occasion he displayed his wonted valor, and, while standing in the breach of the castle, he was struck by a cannon shot, which wounded both legs, one being fractured by a cannon ball, and the other injured by a splinter. He was then taken prisoner by the French, and a tedious confinement followed. This was in part occasioned, as some assert, by his great anxiety to preserve the symmetry of the limb, which led him to undergo a second operation, to remove a deformity which had been occasioned by an ill-set bone. To relieve his weariness he called for some books of chivalry, and when these were exhausted their place was supplied with the "Lives of Saints," and other devotional works. He read the latter with extraordinary eagerness. He admired the zeal of those holy men; he sympathized in their sufferings; he envied their glory; and he aspired to their eternal recompense. His thoughts and wishes were thus turned into a new channel, and he entered on the path of spiritual warfare, with his natural ardor stimulated and inflamed by religious devotion.

Accordingly, he arose from his bed of sickness, resolved to renounce the pursuits and pleasures of the world, and to dedicate himself to the service of God. Still it was not without a desperate struggle that he could accomplish this resolution. He had a passion for military fame; he had questionable alliances which it was necessary to abandon; and his earthly ties were as strong as his temperament was violent. But the new-born influence of religion overcame all obstacles. March 24, 1522, he passed the night in prayer and fasting in the church of the Holy Virgin at Montserrat; and, having hung up his arms on the altar, he consecrated himself, according to all the forms of chivalry, to her service. At the same time he made a vow to perform a pilgrimage barefoot to Jerusalem; and he carried his immediate penance to such extremes of austerity as to enervate his frame and to endanger his life.

The spiritual glories of St. Francis or St. Dominic now took, in his aspirations, the place which had been before held by the knights of mediæval romance. With souls like his there is no middle course: he threw himself, with all the fire of his temperament, upon the new aspirations which these thoughts engendered. When he set out from Montserrat, the first step which he took was to serve the poor and the sick in the hospital of the neighboring town of Manresa. There his zeal and devotion attracted such notice that he withdrew to a solitary cavern in the vicinity, where he pursued alone his course of self-prescribed austerity, until he was carried back, utterly exhausted, to the hospital in which he had before served. To this physical exhaustion succeeded a state of mental depression, amounting almost to despair, from which, however, he arose with spiritual powers renewed and invigorated by the very struggle. In 1523 he repaired from Manresa by Barcelona to Rome, whence, after receiving the papal benediction from Adrian VI., he proceeded on foot, and as a mendicant, to Venice, and there embarked for Cyprus and the holy land. He would gladly have remained at Jerusalem, and devoted himself to the propagation of the gospel among the infidels; but, not being encouraged in this design by the local authorities, he returned to Venice and Barcelona in 1524.

It is curious, in reviewing the lives of some of those eminent men who have left lasting traces of their exertions, to observe how their own inclinations, had Providence allowed them their course, would sometimes have led them away from the work which they were commissioned to accomplish. Had Wesley proved a successful missionary, which was his earliest enterprise, the society which bears his name might never have existed. Had Loyola been permitted to spend his energies in attempts at converting the Jews, or Turks, his life might have been of short duration, and his name might never have been heard beyond the limits of Palestine.

When his pilgrimage was completed, and he was restored to his native country, his passion for religious enterprise and distinction did not in any degree abate; but he soon discovered that his literary acquirements were wholly insufficient for his purpose. He began, therefore, at Barcelona, when thirty-three years of age, to prepare himself by study for the work of religious teaching, and, with this in view, he was not ashamed to return to the very rudiments of grammar. He followed up these elementary studies by a further course, first at the new university founded by Cardinal Ximines at Alcalá, and afterward at Salamanca.

At Alcalá he pursued his studies with great ardor until the year 1527. He attempted at the same time the sciences of logic, physic, and theology, and was bent on accomplishing by a single effort what results to other men from the patient employment of much time and labor. But it was too late in life to accomplish much without supreme effort. His mind had been already formed to more active pursuits, and he could with difficulty bend it to the acquisition of learning. He acquired a confused mass of knowledge, but his endeavor to grasp so much, at so great a disadvantage, still left him far abaft in true scholarship.

He discovered his failure and thence forward directed his energies to a more attainable end; and, though he did not relax his struggles after learning, he seems rather to have looked for success from the influence which personal intercourse generally enabled him to acquire over those about him. Some lectures, however, which he delivered at Alcalá, gave offense to the authorities of that university; and after an imprisonment of forty-two days he was prohibited from public preaching, until he should have completed a course of four years in theology. It seems, too, that, together with two or three companions, he had assumed a peculiar dress, which they were ordered to lay aside.

From Alcalá he removed to Salamanca; but there, too, he had no sooner resumed his preaching than the inquisitors laid hands on him; and, after a second confinement, with severer treatment, he and his companions were again dismissed, under a sentence not widely differing from the preceding. On these occasions it was not so much the character of his sermons which gave the offense, as the circumstance that they were delivered by a layman.

Thus discouraged in his native country, he hoped to find a wider, or at least a safer, field for his exertions in France. Accordingly, he departed for Paris, and arrived there in the beginning of February, 1528. His means were extremely small, but, with what had been provided by the generosity of his friends, he continued his studies at the university of Paris, and received his degree of master of arts in 1534. Here, too, at the university, which then contained more than ten thousand students of various nationalities, and was fermenting with religious reform, he gathered the first members of his future society — the "company of Jesus"— which exercised such an immense influence upon the religious, moral, and social condition of the modern world under the later name of Jesuits.

In 1534, Loyola, Peter Le Fevre, James Lainez, Francis Xavier, Nicholas Bobadilla, Alfonso Salmeron, and Simon Rodriguez formally met in the chapel of Montmartre in Paris, and took vows to make a pilgrimage to the holy land, and, failing in that, to offer their lives to the service of the pope. By arrangement they met again in Venice in 1536, and the pilgrimage having become impossible through the outbreak of a war with the Turks, they journeyed to Rome the next year to take further measures for the establishment and enlargement of the new order. They submitted to the pope, Paul III., the rule of the proposed order, the great aim of which was expressed in their adopted motto: "To God's greater glory"; and the vow of which, in addition to the threefold obligations common to all Catholic religious orders, of chastity, poverty, and obedience, comprised a fourth, whereby the members bound themselves unreservedly to go as missionaries to any country which the pope might indicate to them.

The new rule was approved by a bull dated September 27, 1540; and in the following year the association was practically inaugurated at Rome, by the election of Loyola as its first general, with tenure for life and absolute powers. He and his subjects made their profession in the church of St. Paul, April 22, 1541. His own vow was as follows: "I hereby promise to the all-powerful God, and to the pope, his vicar upon earth, in presence of the blessed Virgin, his mother and of the company, perpetual poverty, celibacy, and obedience, according to the rule of life contained in the bull of the society of our Lord Jesus, and the constitutions already and hereafter to be published. I promise that I will cause young persons to be instructed in the faith according to the same bull and to the constitutions."

The pope immediately availed himself of the services thus offered him, and sent the six disciples on various missions into different parts of Europe. Loyola alone remained at Rome, and employed himself in offices of piety. He lectured publicly on religious subjects; he discharged many duties of humanity and charity; he took measures for the conversion of the Jews at Rome; he established a retreat for women reclaimed from sin; he founded an asylum for orphans; and the leisure which he could spare from these holy works he devoted to composing the "Constitution of the Order."

These were founded on the principle of uniting spiritual meditation with active habits of practical piety; so that, while, on the one hand, he enjoined mental prayer, frequent self-examination, and religious retirement, on the other, he engaged his disciples to use every exertion for the instruction and sanctification of the rest of mankind. He commanded them to be perpetually active in preaching and missions, in the conversion of infidels and heretics, in the inspection of prisons and hospitals, in the direction of consciences, and the instruction of youth.

To this end he discouraged every severity of mortification, and all superfluity both in their public and private devotions. He prohibited the possession of property by any of his establishments, except colleges, which he permitted to be endowed for the advantage of necessitous students; and he closed, as far as he was able, all the various sources of ecclesiastical emolument.

In this mere sketch of the life of Loyola, the internal constitution of his order must be passed over. The particular laws by which it was regulated, the gradual development of its principles, and the beneficent results, as well as the abuses which flowed from them, belong to the wider domain of church history. It is enough to give some faint notion of its earliest progress. Six years after the confirmation of the order of Jesuits, a college was opened to them in Spain by Francis Borgia, duke of Gandia, and endowed with the same privileges as those of Alcalá and Salamanca. This was the first of a great number of Jesuit colleges. Its statutes were prescribed by Loyola.

In the same year, to give some pledge for the sincerity of his vow of self-denial, and to secure his followers against one of the commonest temptations of ambition, he prevailed upon the pope to exclude them and their successors, by a perpetual edict, from the possession of bishoprics, abbeys, and every description of benefice. This restriction not only stamped them with a peculiar character, and recommended them to popular favor as singular instances of self-devotion, but also left them, for the furtherance of the especial objects of the society, the leisure, talents, and industry which might otherwise have been employed in the pursuit of ecclesiastical dignities, or the performance of pastoral duties. But it was not always faithfully observed, even during the lifetime of Loyola.

After the first step had been taken, the progress of the company of Jesus surpassed in rapidity all that is recorded of the infancy of the older establishments. It was scarcely planted in Spain before it spread to Ferrara, and other parts of Italy. In 1548 it got a footing at Messina and Palermo. In 1550 it was introduced into Bavaria; and in the same year it was still further confirmed by a bull of Julius III., and enriched, as it had previously been, by abundant benefactions from the apostolic treasury.

Two years afterward the order founded a Germanic college at Rome, and by this time it could boast of similar institutions in many of the most civilized cities of Europe. Nor was its influence confined to Europe only. Its missionaries had already penetrated into India, Africa, and America. In the year 1553 they presented themselves in Cyprus, at Constantinople, and Jerusalem, and were carried by the same impulse into Abyssinia and China. France alone avowed her suspicion of their principles, and refused them admission; nor were the utmost endeavors of Loyola himself able to achieve this object. However, the perseverance of his followers, supported by their general success, succeeded even there, and in February, 1564, less than a decade after his death, they opened their celebrated college in the Rue St. Jacques at Paris.

This sudden and rapid prosperity brought cheer to Loyola when he most needed it. He was prematurely worn out by his long continued austerities and arduous responsibilities. Up to this time his disciples represent him as the only spring of all the movements of the order, and the sole spirit of the mighty body which had already spread its influence to every quarter of the world. The exactions of the great task claimed his life as the penalty, and, surrounded by his disciples, he peacefully expired in Rome, July 31, 1556. His remains now lie in the church of the Gesú, Rome. Gregory XV. canonized him in 1622 as Saint Ignatius.

In person, Loyola was of middle stature, rather low than tall. His brow was large, complexion brown, eyes deep set and full of fire, head bald, and his nose aquiline. He walked with a slight halting gait in consequence of the wound he received at Pamplona. His demeanor was one of animated piety, and the zeal of the enthusiast marked his every action in spite of his penance and vigils.

His well-known "Spiritual Exercises," which was his chief work and has been translated into many languages, is believed to have been written during his residence at Manresa, soon after his return from Jerusalem in 1522. The merits of the work appealed strongly to Pope Paul III., who issued a special bull in its praise and confirmation, and it subsequently became the guide and inspiration of his followers. This work, however, was not given to the world at large until 1548.

Like all men who have produced great results, Loyola has been made the subject of very conflicting estimates. By his enemies he has been described as "a vain, illiterate enthusiast, without talents, without knowledge, a mere machine in the hands of a crafty and worldly hierarchy." Such an opinion is its own best answer. The true perspective of history shows him to have been one of the greatest characters of his age. Whatever abuses may have followed in the working out of his system — and for this he surely was not to blame — he wielded "the powers of the earth for the service of heaven" with a discipline, and a dauntless courage that has been the admiration of centuries. He arrested the dissolution of religion by genuine devotion; and his followers fought the battles of their church by possessing themselves of all the strongholds which command the public mind — the pulpit, the press, and the institutions of learning. Through these agencies, and above all by their missions, they spread light in various lands, and have proved a bond of union between civilization and the savage state.

"It is Loyola who has shown the world," in the judgment of Isaac Taylor, "what might be meant by the phrase, 'spiritual polity.' It is he who has shown how to smelt soul ore into one mass — a mass uniformly crystallized, and shining on its surface, and mathematical in its figure, and thoroughly malleable and ductile, and a good conductor of sounds. It is he who has brought to perfection the process — often attempted — of forging hundreds of individual wills into so true a continuity of substance that the volitions of single mind should pass, like galvanic currents, through the whole, and become intelligible and effective at the remotest distances.

"His biographers assure us that he was accustomed frequently to cast his eyes heavenward; yet he was neither the mystic nor the contemplatist — his institute is all earthward bent. Spiritualism would have been to him idleness; he could occupy himself with nothing that had no product. The depths which he fathomed were not those abysses of the moral worlds whereinto somber and solitary meditation plunges; but those near-at-hand deeps of human nature which a few minds are gifted to reach, as at a step, by intuition of the way. As our Shakespeare knew human nature to paint it truly in all its moods, so Loyola knew it to rule it absolutely in all those moods.

"Loyola could never have been the reformer of established systems; for he worshiped every shred of the ecclesiastical tatters of past ages. But he was the inventor of a scheme essentially his own, and with marvelous sagacity, and a tact fertile in resources, he contrived to lodge the prodigious novelty — the society of Jesus — within the very adytum of the old system, and to do so without noise, without any displacement of parts, or the breaking off even of a moulding! By his hands a house was built within a house; yet none had heard the din of the builder's tools while it was in progress."

CALVIN

A. D.		AGE
1509	Born at Noyon, France, ...	..
1521–26	Studied at Paris, Orleans, and Bourges, ...	12–17
1528	Advocated doctrine of reformation,	19
1529	Preached at Noyon; returned to Paris, ...	20
1533–34	Fled from Paris; resigned benefice at Noyon, ...	24–25
1536	Arrived at Geneva; lectured on theology; published his "Institutes" at Basel, ...	27
1538	Banished from Geneva; preached at Strassburg, ...	29
1540	Married; attended diet at Worms, .	31
1541	Returned to Geneva, ...	32
1553	Appeared against Servetus, ...	44
1559	Founded the academy at Geneva, .	50
1561	Invitation to Paris; "New Testament Commentaries,"	52
1564	Died at Geneva, Switzerland, . . .	55

JOHN CALVIN, one of the most eminent of the Protestant reformers, and a noted theologian, was born at Noyon, Picardy, France, July 10, 1509. His father, Gerard Calvin — or Cauvin, as it was in French — was secretary of the diocese, and procureur-fiscal of the district of Noyon, and his mother was Jeanne Lefranc.

One of a family of six — four sons and two daughters — he was, with his two surviving brothers, destined by his father for the church; and when but twelve years of age he was appointed to a benefice in the cathedral church of Noyon. At the age of seventeen to this benefice was added the curacy of Marteville. These benefices Calvin held as a means of support during the period of his education, and even for a short time after he had entered upon his career as a reformer.

Calvin's education was greatly aided by the noble family of Montmor, in whose neighborhood he lived, and by whom he was invited to share in the studies of their children. In a way he was adopted by them; and, when they went to Paris in his fourteenth year, he accompanied them. Here he entered the Collège de la Marche, then under the regency of Mathurin Cordier — better known as Corderius — and it was under this distinguished master that Calvin laid the foundation of his wonderful mastery of the Latin language. During this early period, even, he was distinguished by great mental activity, and grave severity of manner, which led his companions to surname him the "accusative."

It seems that about this time Calvin's father changed his plans with reference to his son's career, and sent him to Orleans to study law at the university under Peter de Stella, one of the most famous jurists of his day, and afterward president of the parliament of Paris. At Orleans he continued the same life of rigorous temperance and earnest studiousness for which he was already noted. Beza tells us that he spent half the night in study, and devoted the morning to meditation on what he had acquired. These undue habits of study thus laid the foundation of the ill-health which marked his later years.

It was while at Orleans that he began to study the scriptures, and received his first impulse toward those theological studies which afterward distinguished his name. Peter Robert Olivetan, a relative of Calvin, was there engaged in making a translation of the Bible, and it was through this contact that the religious instinct was awakened within him which was soon to prove the master-principle of his life. From this time on he began to question his traditional faith, and, although he continued his legal studies for a time, it was evident that his main interest was religious and theological.

From Orleans he went to Bourges to continue his studies, and here a more pronounced change took place in his character. Zeal for the truth, as he now apprehended it, became the passion of his life. He learned Greek, began to preach the reformed doctrines, passed over into the ranks of Protestantism, and openly avowed himself a disciple of the reformation.

In 1529 he preached at Noyon, and shortly thereafter proceeded to Paris, which had become a center of the "new learning" under the teachings of Le Fevre and Farel, and the influence of the queen of Navarre, sister of Francis I. Here he published, at his own expense, an edition of Seneca's *De Clementia*, with the view of conciliating Francis, who had taken active measures to quell the rising spirit. But he was compelled to flee from Paris in 1533, on account of a sermon on justification by faith which openly provoked the Sorbonne. He also resided for a time at Angoulême, where he began his "Institutes," returned to his native place, where he resigned the preferment he held in the Roman church, and for a year or two led a wandering life, sheltered in various places.

Under the anticipated patronage of the queen of Navarre, he returned to the French capital in 1534; but the persecution against the Protestants raged with such fury that the fate of his previous visit again pursued him, and he betook himself to Basel, where, in 1536, he published in Latin the first edition of the "Institutes of the Christian Religion," with the famous preface addressed to Francis I. The concentrated vigor of this address, its intensity of feeling, rising into indignant remonstrance, and at times a pathetic and powerful eloquence, made it one of the most memorable documents in connection with the reformation.

From Basel, Calvin went to Ferrara, where, at the court of the duchess Renée, daughter of Louis XII., an adherent of the reformation, he found a refuge in common with many others. Driven thence by the inquisition, he returned to France, and, as he still found no security there, in August, 1536, he went to Geneva on his way back to Basel, as if by accident, and with this city henceforth his name is immortally identified.

Arrived in Geneva, he met there his friend, Louis Tillet, who communicated the fact of his arrival to Farel, then in the very midst of his struggle to promote the reformation in the city and neighborhood. Farel hastened to see him, and urge upon him the duty of remaining where he was, and undertaking his share of the work of God, under the burden of which he was threatened with failure. Calvin did not at first respond to the call. He was given, he himself says, to his "own intense thoughts and private studies." He wished to devote himself to the service of the reformed churches generally, rather than to the care of any particular church.

A life of intellectual and theological labor was that which at that time was most congenial to him. By some strange insight, however, Farel penetrated to the higher fitness of the young stranger who stood before him, and he ventured, in the spirit of that daring enthusiasm which characterized him, to lay the curse of God upon him and his studies, if he refused his aid to the church of Geneva in her time of need. This seemed to Calvin a divine menace. "It was," he said, "as if God had seized me by His awful hand of heaven." He abandoned his intention of pursuing his journey, and joined eagerly with Farel in the work of reformation.

Such was the beginning of Calvin's great career in Geneva. Having entered upon his task, he soon infused an energy into it which crowned the struggling efforts of Farel with success. Farel had already introduced the reform worship; the citizens had asserted their independence against the duke of Savoy, whose regime had called forth the patriotic as well as the religious feelings of the people. The magistrates and people eagerly joined with the reformers in the first heat of their freedom and zeal. A Protestant confession of faith was drawn out, approved of by the council of two hundred, the largest governing board of the city, and then proclaimed in the cathedral church of St. Peter's as binding upon the whole body of the citizens. Great and marvelous changes were wrought in a short time upon the manners of the people; where license and frivolity had reigned, a strict moral severity began to characterize the whole aspect of society.

The strain, however, was too sudden and too extreme. A spirit of rebellion to the rule of Calvin and Farel broke forth; they refused to yield to the wishes of a party animated by a more easy and liberal spirit than themselves, and known in the history of Geneva under the nickname of Libertines; and the consequence was that they were both expelled from the city after less than two years' residence.

Calvin retreated to Strassburg, where he had meant to go when arrested in his course at Geneva. Here he settled, and devoted himself to theological study, and especially to his critical labors on the new testament. Here, also, in October, 1540, he married Idelette de Bures, the widow of a converted Anabaptist. The marriage appears to have proved a happy one, although not of long duration. They had but one child, a son, who died in infancy.

The Genevans found, after a short time, that they could not well get on without Calvin. His rule might be rigid; but an authority, even such as his, which might gall from its severity, was better than no settled authority at all. So, in September, 1541, at the repeated solicitation of the magistracy, who had also procured the intervention of Bern and Basel, Calvin returned to Geneva with the fair and full understanding that his discipline was to be carried out. His ideal was a church in which reform should embrace not only doctrine and ritual, but the whole life. The state is to aid, not rule this spiritual institution, although both church and state concur in the sphere of morals. To this end the presbyterial system was fully inaugurated, which became a model for the government of the reformed churches. The consistory, or presbytery, a body composed of twice as many laymen as clergymen, the laymen annually elected by the church, gradually absorbed the power of the general council elected by the people. The consistory was the real tribunal of morals, and its inquisitorial power extended to the whole population. It could not punish beyond excommunication, but the civil power was to do the rest. The system was for a time eminently successful. Geneva became the most moral town in Europe. At the same time public worship was ordered with extreme simplicity, all that appealed to the senses and imagination being excluded.

Such power as Calvin now exercised could not be maintained, except in a thorough despotism with a standing army. Frequent collisions occurred between the consistory and the council, and in the former the authority of Calvin was far from being absolute. His struggle with the Libertines lasted fourteen years. During that long struggle occurred also Calvin's controversies with Castellio, Bolsec, and Servetus — the most melancholy events which took place under his sway. The polemical truculence displayed in his controversy with his one-time friend Castellio, and his part in the condemnation of Servetus, whose speculations on the Trinity were abhorrent to him, reveal phases of intolerance that can never be reconciled with the other evidences of greatness in his character.

Michael Servetus had entered into various connections with Calvin, even from the time of his early residence in Paris. He subsequently sent him various documents containing the views he held, finally developed and published under the title *Restitutio Christianismi,* or "Christianity Restored." Calvin never concealed his abhorrence of these views, and as early as 1546 threatened that if Servetus should come to Geneva, "he would do what he could to bring him to condign punishment."

The history of his seizure and condemnation at Vienne by the Catholic authorities, and especially of Calvin's share in the correspondence which led to his seizure, is very complicated and obscure. It has been maintained that Calvin was the instigator, through a creature of his own by the name of Trie, of the whole transaction; it is certain that he forwarded to the authorities, through Trie, private documents which Servetus had intrusted to him, with a view to the heretic's identification, and as materials for his condemnation. Servetus was sentenced to be burned, but effected his escape, and, after several months' wandering, he was found at Geneva. It was his intention to proceed to Italy, where he hoped his opinions might meet with some degree of toleration, and he arrived at Geneva on his way. This is the explanation of an event otherwise unaccountable. Having ventured to church, according to the common account, he was recognized, apprehended, and conveyed to prison by Calvin's order, just as he was about to leave the city.

The particulars of his trial cannot be detailed here. It lasted, with various interruptions, for two months. He attacked Calvin with the foulest epithets, and Calvin retorted with a virulence and foulness quite equal to his own. At length, on October 26, 1553, sentence was passed upon Servetus, condemning him to death by fire. Calvin used his influence to have the mode of death alleviated, but without success. On the very next morning the sentence was put into execution. On an extended eminence at some distance from the city of Geneva, Servetus was fastened to a stake, surrounded by heaps of oakwood and leaves, with his condemned book and the MS. he had sent to Calvin attached to his girdle; amid his agonizing cries the fire was kindled, and the wretched man expiated his heresy amidst the flames.

No one now attempts to justify Calvin's share in the burning of Servetus. The other reformers, even the gentle Melanchthon, vindicated the sad tragedy. It will not suffice to say that Calvin was drawn into the measure, or that the fate of Servetus was in accordance with the law of the state, and, therefore, beyond the control of the reformer. Calvin distinctly understood his own part in the business, and felt that compassion was to yield to conscience. The only apology for him is that he was not, in the matter of religious liberty, in advance of his age. He was no exception to the general rule. Cranmer sent Joan of Kent to the stake, and he himself in a few years followed. Five Genevan disciples of Calvin were burned in France about the same time that Servetus was committed to the flames of Geneva. John Knox and Peter Dens use the very same argument and imagery for the capital punishment of heretics. It took a long time, indeed, for the warring schismatics of the Christian church to learn that man is responsible to God alone for his belief, and that liberty of conscience is a universal birthright.

After the execution of Servetus, and the expulsion of the Libertines two years later, Calvin's power in Geneva was firmly established, and he used it vigorously and beneficently for the defense of Protestantism throughout Europe. By the mediation of Beza he made his influence felt in France in the great struggle that was there going on between the hierarchical party, with the Guises at its head, and the Protestants, led by Condé and Coligny, and, in 1561, he received an invitation to Paris. In that year, however, his energies began to fail. The incessant and exhausting labors to which he gave himself could not but tell on the strongest constitution: how much more on one so fragile as his! Amid many sufferings, however, and frequent attacks of sickness, he manfully pursued his course for twenty-eight years; nor was it until his frail body, torn by many and painful diseases, had, as it were, fallen to pieces around him, that his indomitable spirit relinquished the conflict.

In the early part of the year 1564 his sufferings became so severe that it was manifest his earthly career was rapidly drawing to a close. On February 6th of that year he preached his last sermon, having with great difficulty found breath enough to carry him through it. He was several times after this carried to church, but never again was able to take any part in the service. He nobly refused to receive his stipend, now that he was no longer able to discharge the duties of his office. In the midst of his sufferings, however, his zeal and energy kept him in continual occupation; when expostulated with for such unseasonable toil, he replied, "Would you that the Lord should find me idle when He comes?"

After he had retired from public labors he lingered for some months, enduring the severest agony without a murmur, and cheerfully attending to all the duties of a private kind which his diseases left him strength to discharge. A deep impression seems to have been made on all who visited him on his deathbed; they saw in him the noble spectacle of a great spirit that had done its lifework, calmly and trustfully passing through the gates of suffering into the long-desired and firmly expected repose. He quietly expired in the arms of his faithful friend Beza, on the evening of May 27, 1564, in the fifty-fifth year of his age.

Calvin was of middle stature; his complexion was somewhat pallid and dark; his eyes, to the latest, clear and lustrous, bespoke the acumen of his genius. He was sparing in his food and simple in his dress; he took but little sleep, and was capable of extraordinary efforts of intellectual toil. His memory was prodigious, but he used it only as the servant of his higher faculties. As a reasoner he has seldom been equaled, and the soundness and penetration of his judgment were such as to give to his conclusions in practical questions almost the appearance of predictions, and to inspire in all his friends the utmost confidence in the wisdom of his counsels.

The literary work which he performed is almost incredible, especially when we consider his other labors. He established the academy at Geneva in 1559, of which Beza was the first rector. Here he taught theology to the numerous students that flocked to it, from Scotland, Holland, and Germany. He preached nearly every day, besides; and conducted an immense correspondence. When his works were finally collected and published, they amounted to fifty-two volumes, and comprised commentaries on nearly the whole Bible. His "Institutes," the most important of his works, was also his earliest. In it Calvin elaborated the system of theology based upon the sovereignty of the will of God, and including, as integral parts, the doctrines of predestination, election, and reprobation. His energetic decisiveness and moral zeal spoke in every page of it. The work was hailed with enthusiasm by the German reformers, and it really brought into one body of divinity the scattered and unsystematized reformed opinions of all Europe.

It was not until many years later, however, that the name of Calvin came to be attached to a certain set of doctrinal opinions, and not until the rise of Arminius and the synod of Dort, in 1618, that these opinions may be said to have been polemically marked off from others with which they are generally contrasted, and to which they are recognized as standing in opposition.

The difference of thought expressed in the Arminian and Calvinistic systems is as old as the history of Christian doctrine. In almost every point Augustine may be said to have anticipated Calvin; while Pelagius and the eastern divines, such as Chrysostom, represented a type of opinion upon the whole consonant to that which in more modern times has been opposed to Calvinism. In the Roman Catholic church, since the reformation, the same opposition of thought has presented itself in the famous contest of Jansenism and Jesuitism.

The main point of distinction in the two systems or modes of Christian opinion is as to the operation of divine grace in the salvation of sinners. In the one system, this operation is considered as predetermined and absolute; in the other, as merely prescient, and in some sense conditioned. Predestination and irresistible grace are the keynotes of Calvinism — its two main points. Others were added in opposition to Arminianism — viz., original sin, particular redemption, and the perseverance of the saints; but the first of these is not peculiarly Calvinistic, and the last two are merely corollaries from the doctrines of predestination and grace. Predestination is, in fact, the one distinguishing doctrine of the system, as it was of Augustinianism, of which Calvin was merely the revival. But in his skill as an expositor of the scriptures, and in his terse and elegant style, he possessed advantages to which Augustine was a stranger. The divine will, apprehended as decretive and predestinating, is necessarily irresistible in its efficacy, select in its objects, and persevering in its results. The characteristic of Calvinism, therefore, is that it is a speculative Christian system, springing from a single great principle, carried out rigorously into all its logical consequences.

The church of England in its earlier history was Calvinistic in its creed, although mediæval and Catholic in its ritual. Puritanism was nothing else than a movement to reduce it altogether to a Calvinistic model. In the reaction which followed this movement, the church of England, while retaining its original articles, nearly parted with its Calvinistic faith; and throughout the eighteenth century its chief divines were conspicuously Arminian or latitudinarian. But with the revival of the evangelical party in the end of the century, Calvinism revived; and it maintains to-day a powerful influence over both the Anglican church and the various Presbyterian bodies.

Very different estimates, it may be imagined, have been formed of Calvin's character, according to the point of view from which it is contemplated. None, however, can dispute his intellectual greatness, or the powerful services which he rendered to the cause of Protestantism. Stern in spirit, and unyielding in will, he is never selfish or petty in his motives. Nowhere amiable, he is everywhere strong. Arbitrary and cruel when it suits him, he is yet heroic in his aims, and beneficent in the scope of his ambition. Earnest from the first, looking upon life as a serious reality, his moral purpose is always clear and definite — to live a life of duty, to shape circumstances to such divine ends as he apprehended, and, in whatever sphere he might be placed, to work out the glory of God.

As intimated above, he rendered a double service to Protestantism, which, apart from anything else, would have made his name illustrious; he systematized its doctrine, and he organized its ecclesiastical discipline. He was at once the great theologian of the reformation, and the founder of a new church polity, which did more than all other influences together to consolidate the scattered forces of the reformation, and give them an enduring strength. As a religious teacher, as a social legislator, and as a writer, especially of the French language, then in process of formation, his fame is second to none in his age, and must always conspicuously adorn the history of civilization.

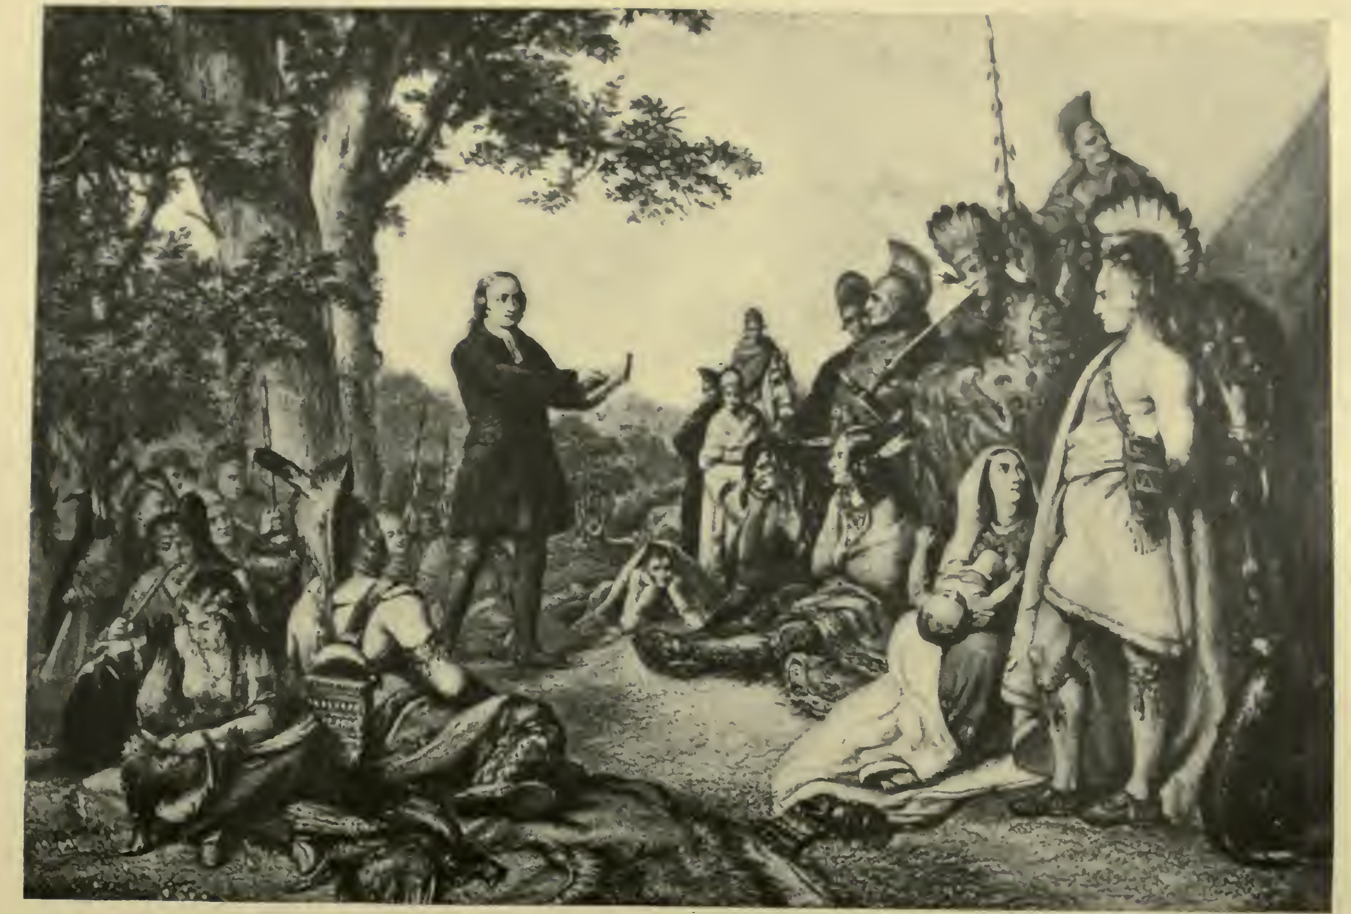
"I have been a witness of him for sixteen years," says Beza, "and I think I am fully entitled to say that in this man there was exhibited to all an example of the life and death of the Christian, such as it will not be easy to depreciate, such as it will be difficult to emulate."

WESLEY

A. D.		AGE	A. D.		AGE
1703	Born at Epworth, England,		1738	Visited Herrnhut, Saxony; founded Methodism,	35
1720	Entered Christ Church, Oxford,	17	1739–44	Preached the new evangelism,	36–41
1725	Ordained deacon,	22	1744	Took part in the first conference,	41
1727	M. A., Oxford,	24	1749	Visited Ireland,	46
1728–29	Ordained priest; tutor at Oxford,	25–26	1751	Married; visited Scotland,	48
1735	Missionary in Georgia,	32	1771	Separated from his wife,	68
1738	Returned to England, and met Peter Böhler,	35	1791	Died at London,	88

JOHN WESLEY, distinguished English preacher and reformer, and founder of the Methodists, was born at Epworth, Lincolnshire, England, June 17, 1703. He was descended from a line of ministers of the church of England, of Puritan principles, some of whom had suffered for their dissent from the orthodox faith. His father, Samuel Wesley, however, rather strictly conformed to the church of England, and for many years was rector of Epworth and Wroote in Lincolnshire. His mother, Susannah Annesley, was the daughter of an ejected minister, and a woman of remarkable intelligence and fervent piety, who devoted herself unstintedly to both the secular and religious education of her children.

Six years after John's birth the rectory at Epworth was set on fire by some refractory parishioners, and the boy — one of nineteen children — was forgotten in the first confusion. He was presently discovered, however, at a window, and by great exertion was rescued at the very moment which promised to be his last. In after life he seems to have seen the hand of Providence in this preservation, and made it the subject of much reflection and gratitude.



WESLEY PREACHING TO THE INDIANS

From a painting

When ten years of age, John was sent to school at the famous Charterhouse in London, and at seventeen entered Christ Church, Oxford. At Oxford he was a very diligent and successful student, and gained distinction as a skillful logician and acute disputant. After much conscientious hesitation as to his motives and fitness for entering the clerical profession — which was finally decided by the influence of his mother — he applied himself to the study of religion. He was particularly impressed by the reading of Jeremy Taylor's *Holy Living and Holy Dying*, and, in 1725, he resolved "to dedicate his life and his death, his whole thoughts, feelings, and energies to the service of God." In that year he was ordained a deacon in the established church, and the following year he was appointed Greek lecturer and moderator of the classics. In 1727 Wesley received his M. A. degree, and left Oxford to assist his father at Wroote. While serving there he was advanced to priest's orders in 1728. He then returned to Oxford as a tutor and fellow of Lincoln college, along with his younger brother, Charles, where he had the opportunity of assembling around him a little society of religious friends or disciples, over whom his superior talents and piety gave him a natural influence. These, through their strict and methodical manner of living, acquired from their fellow students the appellation of "Methodists"— a name derived from the schools of ancient science, and thus destined, through its capricious application by a few thoughtless boys, to designate, subsequently, a large, and vital portion of the Christian world. The intercourse of the Wesley brothers at this time with William Law, the author of the *Serious Call*, had a great influence on their opinions and conduct. They walked two or three times a year from Oxford to visit Law at his house near London.

In 1735 Wesley was induced to undertake a missionary journey to America, to preach to the Indians and colonists. He accordingly accompanied General Oglethorpe to Georgia, where for two years, in a new and untried field, he conducted an itinerant mission. His contact with Moravians, who were his fellow passengers, to America and afterward his fellow laborers in the colony, tended to stimulate his religious zeal. His habits at this period were deeply tinged with asceticism. In his extreme self-denial and mortification in respect to diet, clothing, and the ordinary comforts of life, he affected a more than monastic austerity, and realized, even, the tales of hermitical fanaticism. He even disclaimed against the study of classical authors, and discouraged as sinful any application to profane literature. And the extravagance of his zeal took a direction, such indeed as might be expected from his birth and education, but ill adapted to recommend him to the affections of the colonists. He adhered with the obstinacy of a bigot to the rubric of the church; he refused to administer baptism except by immersion; he withheld the communion from a pious dissenter, unless he should first consent to be rebaptized; he declined to perform the burial service over another.

To add to the difficulties of his position, he formed an indiscreet, though innocent, attachment for a young woman, Sophia Canston, daughter of the chief magistrate of Savannah, whom he wished to marry. On the advice of the Moravian bishop and elders he managed to overcome his infatuation, and the object of his affection soon married another. Piqued by the general turn of affairs, Wesley refused her admission to the communion, and her husband instituted against him an action at law. This led to some very serious scenes, and "shaking the dust off his feet," as he said, Wesley made a sudden, ~~and not very credita~~ble departure for England.

The exalted piety of the Moravian missionaries, with whom Wesley had come in contact, had wrought deeply on his feelings, and given them some influence over his future course. On his return to England in 1738, already impressed with some sense of his own unworthiness, and his failure as a missionary, he became closely connected with Peter Böhler, a man of talents and authority, and a Moravian. With Böhler he could by no means justify the results of his missionary experience, simply on the ground that the Indians had expressed no wish for conversion. If his conscience were thus easily satisfied, argued Böhler, he was yet very far from Christian perfection. Thus, indeed, he certainly appears to have learned from this first experiment on his own powers that he was not yet qualified for the office of missionary. He was thoroughly convinced that he, who would have converted others, was not yet converted himself.

So, through the instructions of Böhler, Wesley entered upon a season of prayer, with all the ardor of his enthusiastic soul. On the evening of May 24, 1738, as one of the members of a society in Aldersgate street was reading in his presence Luther's "Preface to the Epistle to the Romans," he experienced such a change of religious feeling, that, notwithstanding all his previous zeal, he afterward regarded this as the time of his conversion. "About a quarter before nine," says Wesley, "while he was describing the change which God works in the heart through faith in Christ, I felt my heart strangely warmed; I felt I did trust in Christ, Christ alone, for salvation! and an assurance was given me that He had taken away my sins, even mine, and saved me from the law of sin and death." However, when he returned home, he had still some more struggles with the evil one, and was again buffeted by temptations; but he was now triumphant through earnest prayer. "And herein," he adds, "I found the difference between this and my former state chiefly to consist. I was striving, yea fighting, with all my might under the law, as well as under grace; but then I was sometimes, if not often, conquered; now I am always conqueror." This is justly considered as a remarkable day in the history of Methodism; and Wesley himself attached so much importance to the change that had been wrought to him, that he did not scruple to proclaim, to the great scandal of some of his unregenerate friends, that he had never been a Christian until then.

His first act after his conversion was to set out in 1738 on a visit to the celebrated Moravian brotherhood, established under the patronage of Count Zinzendorf, at Herrnhut, in Saxony. There he employed a fortnight in examining the doctrines and disciplines of that sect, and then returned, as he went, on foot. "I would gladly have spent my life there; but my Master calling me to labor in another part of His vineyard, I was constrained to take my leave of this happy place." He had acquired a knowledge of their system, and was thus qualified to apply to his own purposes any part of it which might hereafter serve them.

Wesley returned from his visit to Germany burning with religious enthusiasm, and presently entered into the path which Whitefield, his friend and disciple, had opened for him. The latter, who was a few years younger than Wesley, and like him educated at Oxford, had begun a short time before to address the people in the open air at Kingswood near Bristol. Wesley, after some little hesitation, followed his example, and commenced his field preaching in the same place. Here was the first indication of any approach to a separation from the church of England, and thus, in fact, were laid the foundations of the sect of Methodists; yet such was not the design, perhaps, of either of its founders — certainly not of Wesley.

Wesley's plan was to awaken the spirit of religion slumbering within the church; to revive the dying embers of vital Christianity; to infuse into the languid system new life and energy; and to place before the people the essentials of their faith and to rouse their religious instructions to a proper view of their profession and sense of duty. It was rather an order than a sect that he designed to found — an order subsidiary to the English church, and bearing something of the same relation to it that the various Catholic orders bore to the church of Rome. Its purpose was regeneration, and not a change in civil and ecclesiastical principles of the church of England, any more than the Franciscans or the Dominicans contemplated supplanting the doctrines of Catholicism. At any rate, it was certain that the emulation, which he could not fail to rouse, would in the end be serviceable to the interests of true religion; and it is very possible that, in the depth of his enthusiasm, he held every other consideration entirely subordinate to this.

The first effects of his public preaching have not been surpassed by anything that we read in the history of religious zeal. On one occasion, we are told, when he was portraying with unusual vehemence the doctrine of universal redemption, "immediately one, and another, and another, sank to the earth; they dropped down on every side as though thunderstruck." Sometimes, after he began to preach, many of his believers fell into violent convulsions, and lay struggling around him. At other times his voice was lost amidst the groans and cries of his distracted hearers. Wesley encouraged the storm which he had raised; he shared the "holy enthusiasm" which he imparted; and in every new manifestation he saw nothing but the hand of God confirming by miraculous interposition the holiness of his mission.

At a very early period he divided his followers at Bristol into male and female bands for the purposes of mutual confession and prayer. The establishment of love feasts was equally early. Presently, Friday was set apart by him for prayer and fasting, and a house was erected for the meeting of his disciples. Things were already advancing toward schism. The directors of the established church discouraged the extravagance of the teacher, and pitied the madness of the people. Many clergymen refused their pulpits to men who might turn them to strange purposes. This gave a pretext to Wesley for seeking means of instructing the people independent of the church.

In the meantime, he discovered that there were differences between himself and those with whom he had hitherto been most closely connected — the Moravians, and Whitefield and his followers. These differences were the more difficult to reconcile because they concerned points of doctrine. Wesley differed widely from the Moravians on the doctrine of Christian perfection and the means of grace. Count Zinzendorf visited England in person and a number of conferences with Wesley ensued. No concessions seemed possible on either side, and the controversy ended in an entire and final breach between Wesley and the Moravians.

The dispute with Whitefield, occasioned by the predestinarian doctrines now nakedly advanced by him, was conducted with considerable bitterness, and came to a similar termination. The separation from Whitefield, however, was not so complete as to preclude a temporary reconciliation, which was effected some years afterward; but the difference was clearly proved to be real and irreconcilable; and the permanent division of Methodism may, in fact, be dated from the year 1740.

From this time Wesley became the sole head and inspiration of a separate religious body, and devoted his talents to giving it organization and perpetuity. Headquarters were established in 1740 in a building called the "Foundry," near Finsbury square, London, and there for many years was the see of Methodism. From here Wesley swept aside ecclesiastical traditions, rejected apostolical succession, ordained with his own hands presbyters and bishops, and made his disciples an evangelistic body. In his work of evangelization which he then carried on in England, he was indefatigable. "No founder of a sect or order, no legislator," says Southey, "ever understood the art of preserving his authority more perfectly than Wesley. His restless spirit had now found its proper sphere, where it might move uncontrolled and enjoy a prospect boundless as his desire of doing good — the ambition which possessed him."

It was inevitable that great success should follow his labors. His system of itinerant preaching, and the fact that he required no confession of faith for admission into the fellowship of his church, were wise innovations in any religious body. He gave his strength to working-class neighborhoods; hence the mass of his converts were colliers, miners, foundrymen, weavers, spinners, fishermen, artisans, yeomen, and day-laborers in towns. The door was thus opened to all mankind. The new member was never called upon to secede from the body to which he had previously belonged. He might bear the denomination he chose among the visible members of Christ's church, so long as he renounced his vices and his pleasures, and engaged with regenerate heart in the work of his salvation.

At this time — about 1742 — Wesley and his disciples attained that degree of importance which qualified them to become objects of persecution. On two or three occasions the person of the master himself was in some danger from popular fury; and it may perhaps have been preserved by his singular presence of mind, and the awe which he knew how to inspire in his fellow creatures. But these violent eruptions of indignation, as they were founded on no semblance of reason, and opposed by the civil authorities, were partial and of short duration; and their influence, as far as they had any, was probably favorable to the progress of Methodism. Some calumnies that were raised against Wesley from more respectable quarters, touching his tendency to papacy and his disaffection to the reigning dynasty, arising from entire misunderstanding or pure malevolence, were immediately repelled, and speedily silenced and forgotten.

In the year 1744 Wesley invited his brother Charles, four other clergymen who coöperated with him, and four of his lay preachers to a conference. This was the origin of the assembly or council, which was afterward held annually, and became the governing body for the regulation of the general affairs of the society. Four years subsequently a school was opened at Kingswood for the education chiefly of the sons of the preachers. In the extreme severity of some of the rules which he imposed on this establishment, Wesley seems to have been guided by an ambitious design to set apart his own people from the rest of the community, rather than by the common principles of education, or the common feelings of nature.

From London, as a center, Wesley made long and frequent journeys, usually on horseback, preaching generally twice a day and often four times on Sunday. His journeys were soon extended beyond England — to Ireland in 1749, and to Scotland in 1751. Ten to thirty thousand people would wait patiently for hours to hear him; and his itineraries were triumphal processions from one end of the country to the other. During his unparalleled apostolate he traveled two hundred fifty thousand miles, and preached forty thousand sermons.

In 1751 Wesley married a widow named Vazeille, who had four children, and possessed an independent fortune. The marriage proved an unhappy one. He was greatly annoyed by her jealousy; she opened his letters, revealed his secrets, and deserted him, after proving his foulest slanderer and bitterest enemy. After a few months of continued discord and vexation a separation took place, which became final in 1771. "I have not left her; I have not put her away; I will not recall her," he said. The same calmness of temper and perfect self-possession, which so remarkably distinguished him in his public proceedings, seem not to have abandoned him even in the more pressing severity of his domestic trials.

In 1770, under Wesley's direction, the conference adopted resolutions which provoked the indignation of his orthodox Calvinistic friends. A spectacular controversy then followed between him and two of the most eminent divines of his time — Bishops Livingston and Warburton — on the ultimate salvation of the heathen. In this controversy Wesley maintained that "the heathen who had never heard of Christ could be saved if they feared God and worked righteousness according to the light they had." He believed Marcus Aurelius would be saved; and spoke of the "execrable wretches" who wrangled at the various councils.

In 1784, when it seemed desirable to create a head for his body of followers in America, who should be invested with the highest spiritual authority, Wesley designated Dr. Coke, and issued to him letters of ordination. He announced in substance that regarding himself providentially called, at that time, to set apart some persons for the work of the ministry in America, he, therefore, under the protection of the Almighty God, and with an eye single to His glory, had set apart, as a superintendent, by the imposition of his hands and prayer, Thomas Coke, a doctor of civil law, and a presbyter of the church of England. This is properly considered the second important epoch in Methodism, and was the foundation of the Episcopal form of government which afterward marked the denomination.

Wesley was now eighty-one years old, and he lived for seven years longer in the perfect enjoyment of his health and exercise of his faculties almost to the very end. He died March 2, 1791. His remains lay in state for several days in his chapel in the City Road, where they were also buried. He left no property except the copyright and current editions of his works, which he bequeathed for the use of the religious body he had created. The whole number of his followers at the time of his death is stated at about one hundred thirty-five thousand, of whom more than fifty-seven thousand six hundred were Americans.

In personal appearance, Wesley was under average height, but, according to Tyerman, was "beautifully proportioned, without an atom of superfluous flesh, yet muscular and strong, with a forehead clear and smooth, a bright, penetrating eye, and a lovely face which retained the freshness of its complexion to the latest period of his life." His style in the pulpit was fluent, clear, and argumentative, not impassioned like Whitefield's. His natural ardor and eagerness were moderated by great sagacity and calmness of judgment; and it was through these qualities that he exercised a very imperial domination over the preachers of the Methodist body. He possessed agreeable manners, a conciliating and forgiving temper, and a spirit of marked benevolence.

The entire income from his literary work — amounting to thirty thousand pounds — he distributed in charity during his life. In addition to the school already noticed, he founded an orphan's home at Newcastle, charity schools in London, and a dispensary in Bristol. Yet he managed to do a prodigious amount of literary work. His writings are chiefly polemical and religious. He wrote short English, French, Latin, Greek, and Hebrew grammars; a compendium of logic; extracts from Phædrus, Ovid, Vergil, Horace, Juvenal, Persius, Martial, and Sallust; an English dictionary; commentaries on the old and new testaments; a short Roman history; a history of England; an ecclesiastical history; a compendium of social philosophy; and a Christian library of fifty volumes, for the benefit of his itinerant preachers. He edited the "Imitation of Christ," and the principal works of Bunyan, Baxter, Edwards, Rutherford, Law, Madame Guyon, and others; endless abridged biographies; an abridged edition of Brooke's novel, *The Fool of Quality*; a compendium of physic — not to speak of collections of psalms, hymns, and tunes, his own sermons and journals, and a monthly magazine.

Wesley lived to fix and consolidate, by the calmer deliberation of his later years, the effects, which might otherwise have been transient, of his early enthusiasm. It required many talents, as well as many virtues, to accomplish this — and Wesley was abundantly endowed with both.

His own labors and those whom he inspired to imitate his example were of the noblest description and met with remarkable success. The reformation of life which his preaching produced, for example among the Kingswood colliers and the Cornwall wreckers, is a testimony to the power of religion which cannot be too highly estimated. The subsequent zeal, indeed, which has since characterized the body which he founded as to its mission in the world is only the logical development of its first leaders — for they originally regarded their society in England as simply "one vast mission." Neither Wesley nor his followers, it seems, at first desired to consider themselves a "sect," or new church, in the common usage of the term, but were warmly attached to the old national church, and considered themselves among her true children.

When Wesley died, his "societies" had spread over the United Kingdom, the continent of Europe, the states of America, and the West Indies, but were somewhat lacking in unity. Since then they have so increased, in something over a century since his death, that the living disciples of this great reformer and evangelist form a body of twenty millions throughout the English-speaking world.

Wesley defined the doctrines of his denomination in the tract entitled *A Plain Account of the People called Methodists*. The points chiefly insisted upon were four: First, that orthodoxy, or right of opinions, is at least but a very slender part of religion, if it can be allowed to be any part of it at all; that neither does religion consist of negatives, in bare harmlessness of any kind, nor merely in externals, in doing good, or using the means of grace, in works of piety (so-called) or of charity; that it is nothing short of or different from the "mind that was Christ," the image of God stamped upon the heart, inward righteousness attended with the peace of God, and "joy in the Holy Ghost." Second, that the only way under heaven to this religion is to "repent and believe the gospel" — or, as the apostle words it, "repentance toward God, and faith in our Lord Jesus Christ." Third, that by this faith "he that worketh not, but believeth on Him that justifieth the ungodly, is justified freely by His grace, through the redemption which is in Jesus Christ." And, lastly, that "being justified by faith" we taste of the heaven to which we are going; we are holy and happy; we tread down sin and fear, and "sit in heavenly places with Christ Jesus."

Probably no man ever exerted so great an influence on the religious condition of the people of England as Wesley, and his influence has extended to the remotest parts of the world. "No single figure influenced so many minds, no single voice touched so many hearts."

"The Christ of the Cross and of the Throne," said Dr. John Clifford on the occasion of the Wesley centenary, "has received gifts of men for men, some apostles and prophets, and some pastors and evangelists. And of those men He has in His grace bestowed in these later centuries, John Wesley holds a place as primary as it is arresting, and as unchallenged as it is immeasurably and prophetically fruitful. He is the chief prophet of the eighteenth century. The prophetism of the new testament in all its sublime qualities and successes reaches its maximum in him, and places him at the spring head of the spiritual life of our modern England. * * * No man with an eye for spiritual facts can look into Wesley's history without seeing God; and he who looks continuously is likely to feel, as Newton did after looking at the sun, that the image of God is so burned into his soul that he can see nothing else."

PHILOSOPHY

SOCRATES

First Socrates,
Who firmly good in a corrupted state,
Against the rage of tyrants single stood,
Invincible! calm reason's holy law,
That voice of God within th' attentive mind,
Obeying, fearless, or in life, or death:
Great moral teacher! wisest of mankind!
— *Thomson.*

SOCRATES, celebrated Greek philosopher, and founder of moral philosophy, was born at or near Athens, Greece, about 470 B. C. Some writers definitely assign the year 469; others, dates ranging from 469 to 471. He was the son of Sophroniscus, a sculptor, and himself followed this artistic profession in the early part of his life. His mother, Phænarete, was a midwife, and he frequently compared his method of teaching, in after years, to her vocation.

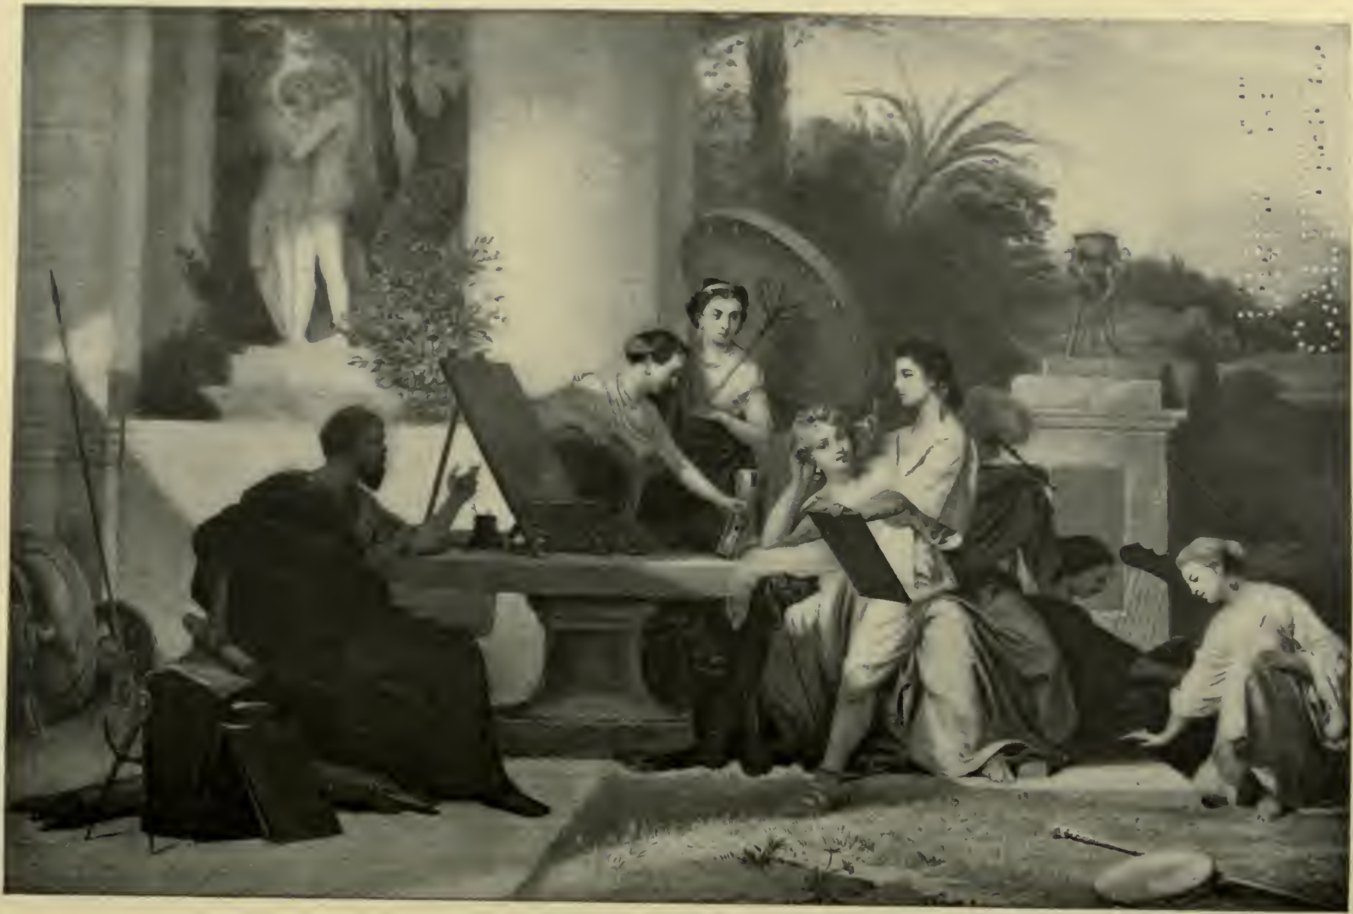
The period over which the lifetime of Socrates extended was the most brilliant in Athenian history. He saw Athens at its zenith, and he lived to see its fall. A few years before his birth the great Persian war had come to an end. Sparta had renounced the headship of the Greek states in favor of Athens; and Pericles began to take part in public affairs the same year that Socrates was born. Æschylus was still living. Sophocles won his first prize in 468, and Euripides began to exhibit in 455. The genius of Phidias and Polygnotus created and adorned the Parthenon; and Athens was made the most splendid of Greek cities. Orators and rhetoricians were attracted to its streets and groves, and under the name of sophists won an important place in its intellectual history.

Few events of Socrates' life are recorded with much definiteness. He had the usual education of the Athenian citizen, which included readings from the Greek poets, and the elements of the sciences then known. To the study of physics he gave special attention, but, finding no satisfaction in the current speculations and guesses in that field, he abandoned it, and turned his attention exclusively to the study of man and morals. The most important influence on his mental development was his intercourse with the sophists who frequented Athens. Among these was Archelaus — a disciple of Anaxagoras; Parmenides, and "the double-tongued and all-objecting Zeno."

Before he began the serious business of his life — teaching — Socrates had led an active life among his fellow citizens. He distinguished himself as a soldier at the battles of Potidæa, Delium, and Amphipolis. His constitution was singularly robust, and enabled him to surpass all his comrades in the endurance of toil, hunger, thirst, and hardships of war and weather. He went barefoot, and wore the same light clothing all the year round. His courage was not confined to the battle field. He stood equally fearless and unmoved before a tyrant and in the face of a mob. Nothing could terrify him into doing what he deemed to be unjust.

Somewhere about the middle period of his life he relinquished his profession as a sculptor, and gave himself up to the career that made him famous. It is evident that he married, unhappily for himself, about this time. His wife — Xanthippe — who has passed into history as the typical scold — bore him three sons, one of whom was a mere lad at the time of his father's death. Socrates himself is reported to have said that, knowing her violent temper, he married and endured her chiefly for self-discipline.

Unlike other philosophers, Socrates did not travel in pursuit of knowledge; he did not write; he had no school; he neither asked nor would receive pay for his instructions.



SOCRATES AT ATHENS

From the painting of H. F. Schopin

In the spirit of a prophet or an apostle he girt himself to work with an immovable conviction that he was divinely called to it. His habit was to go about the streets of Athens and talk with any one who came in his way, young or old, rich or poor. In outward aspect he presented a strange contrast to the professional and paid teachers of the day, the sophists. These, wealthy and well dressed, and accompanied by flocks of admiring disciples; he, poor, and poorly clad, ugly to a ridiculous degree, and conversing with men of all classes on any subject familiar to them, or that affected human life — justice, courage, temperance, and all the duties and relations of a citizen. He was likened to the popular figures of Silenus, which, outwardly ugly, held within them images of the gods.

His reputation grew, and people came from distant Grecian cities to hear him talk. In the story of his own life, which he told at the close of it, he says that one of his friends, Chærephon, put the question to the oracle at Delphi, whether any other man was wiser than Socrates? `The answer given was that there was none wiser. Not being conscious of the possession of wisdom, Socrates was perplexed, until at last, after testing the supposed knowledge of many distinguished men, he interpreted the reply of the oracle as meaning that whereas other men thought they knew, he was one of the few conscious of their own ignorance. From this time he gave himself up more sedulously to the work of convincing men by cross-examination as to the vagueness of their knowledge on those things which it was most important for them to know, the things relating not to each man's special trade or profession, but to that which was common to all — the conduct of life.

Beginning with familiar conversation on any matter of passing interest, he led his companion to an attempt at defining the subject which he wished him to examine, as justice, courage, or temperance; he then asked questions to test his answer, and so brought him to see that his definition was imperfect, including some things that had nothing to do with the matter, excluding others that were essential; a second and third attempt was then made, to be followed up in a like manner. Aristotle remarks that Socrates was the first thinker who paid attention to accurate definitions. The process stimulated thought in many ways; and by his friend and disciple, Plato, it was applied to every subject of intellectual research. But Socrates discouraged speculation upon all subjects that had not a direct and practical bearing upon man's action and duty.

He was especially fond of the young, and was successful to an extraordinary degree in winning their hearts. His aim was always to lead them in a path equally remote from a despairing scepticism like that of the sophists, and from a groveling superstition such as was spreading among the people. It is not easily apprehended what a rapture of admiration, reverence, and love was called forth by this Silenus, shrining a divinity. Strong men in middle age, as well as the young, yielded to the witchery of his voice, and bowed, often weeping, before this searcher of their hearts.

He believed himself to be under the guidance of an inner voice which habitually restrained him from this or that course of action in which he would otherwise have engaged. It forbade him, for instance, to enter into the ordinary contests of political life. Again, when he was put upon his trial, the voice dissuaded him from preparing any elaborate defense. He spoke of this habitually in familiar conversation; and it lent color afterward to the accusations of his enemies that he was making innovations in the established religion. He was, nevertheless, scrupulously careful in conforming to all recognized rites and ceremonies, and in exhorting men to reverence the gods.

It is not clear what was the exact position of Socrates as to the religion of the state. That he believed in one supreme God, Creator and Ruler of the universe, is clear. That when he touched the tales of mythology he did so with delicate latent laughter and contempt is also clear. But no record is made of any distinct avowal, either of belief or disbelief, in the gods recognized by the state. The charge of introducing new divinities is believed to refer to his constant assertion of an inward voice which he recognized as a divine guide, which, however, never incited to action, but only warned and restrained. This inward voice was afterward spoken of as the *dæmon* of Socrates, and has been the theme of endless discussions.

He appears to have held no public office until his sixty-third year. In that year he took his place as one of the fifty senators taken by lot from the tribe Antiochus. It so happened that the senators of this tribe had the task of presiding over the popular assembly on a very important occasion. Certain generals, who had gained a great naval victory over the Spartans at Arginusæ, were accused of having neglected to rescue the drowning soldiers on their own side. Great popular excitement arose; a proposition was made to the assembly to set aside the regular formalities prescribing that each accused person should be separately tried before sworn jurors, and to leave it to a vote of the people there assembled whether these generals should be condemned to death. It was for the presiding senators to put this question to the vote. Socrates, undeterred by threats of sharing their fate, stood alone in refusing to be a party to the illegality, and the vote was carried under his solemn protest. Not less courageous was his conduct when the oligarchy known as the thirty tyrants had established themselves in Athens.

It was impossible that such a man should escape the usual lot of prophets and reformers. Socrates made enemies of many men whom he humiliated by his remorseless criticism, or by his public denunciation of their vices; others disliked and dreaded him, on account of his seemingly ambiguous position toward the government and religion of his country.

The men whom he sought out for cross-examination, he tells us himself, were the most famous artists, poets, orators, and statesmen — those at once most sensitive to the humiliation of his intellectual surgery, and most capable of making their enmity effective. We must recollect, too, that in the old age of Socrates, the Athenians were suffering the degradation of the tyranny which resulted from their defeat in the Peloponnesian war, and that at the time of his accusation, as they were exulting in deliverance from the yoke of their tyrants and in return to their ancient institutions, they were all the more disposed to have their suspicions roused by an accusation of leadership in an enterprise which threatened intellectual as well as religious revolution.

As early as 423 B. C. a formidable assault was made by Aristophanes in one of his masterpieces, *The Clouds*. Aristophanes was a man of an earnest conservative temper in politics and religion, and in this play he held up Socrates to ridicule as the archsophist, and the ringleader of Athenian freethinkers. The great teacher was presented on the stage and made not only ridiculous, but odious as a corrupter of religion and morals. The blow told. The satirist gave definite form and utterance to hostile feeling already existing, and even suggested the course ultimately taken.

Socrates, however, was allowed for twenty years longer to pursue his course unmolested by the government. When the Peloponnesian war came to an end, and the thirty tyrants were masters of Athens, Critias, his old pupil, being one of them, Socrates was subjected to some persecution; and, on the reëstablishment of the democratic government, a formal prosecution was instituted. The leader in the cause was one Anytus, a wealthy trader and an influential politician. With him were associated Meletus, a poet, and Lycon, an orator. The charges brought against Socrates, now an old man of seventy, were substantially the same as those put forward by Aristophanes in *The Clouds*: that he did not believe in the gods which the state believed in, that he introduced new gods, and that he corrupted the youth by his teaching. Death was proposed as the penalty.

Socrates declined to make use of a speech composed for him by the orator, Lysias; and he avoided making in his own speech the customary appeals to the passions. He spoke with the confidence inspired by a good conscience, and at the same time with a consciousness that his condemnation was a foregone conclusion. The spirit and substance of his defense is probably presented to us in the piece known as the *Apology of Socrates*, attributed to Plato. Socrates was condemned, but only by a small majority of his judges. In his speech, after sentence, in mitigation of the penalty, he repeated his avowal of ignorance of matters which were to others themes of confident boasting and dogmatism. He told the judges that to die was a pleasure, because he was going to hold converse with the gods. He claimed as his due from the state honor rather than punishment. Such a bold, frank defense proved so offensive to the court that it not only remained inexorable, but decreed death by a still larger majority. Fidelity and firmness in the martyr are always in the eyes of the persecutor pride, obstinacy, and wilfulness, and make his offense the greater. Socrates was sent back to the prison to await the end. He was to drink the cup of hemlock. This would, in the usual course, have followed on the day after the sentence; but the sacred vessel which carried the annual Athenian offering to the temple of Apollo at Delos had just set sail, and during its absence no execution could take place. For thirty days the life of the teacher was prolonged, and during this time his friends had free access to him. Means of escape were offered by some of them, but he declined to avail himself of the offer. Death had no terrors for him, and he conversed with his friends to the last with unaffected serenity and the cheerfulness of faith and hope. On the last day Socrates set before his friends the ground of his belief in the immortality of the soul.

The conversation is preserved for us, with other details of the closing scene in the dialogue of Plato, named after Phædo, the beloved disciple of the master. The sunset on the fatal evening, as the executioner presented the cup to the firm hand, directed by the unyielding countenance; the silence broken by his parting words as life ebbed away and the darkness gathered over his eyes; the illustrious form recognized as lifeless by the sorrowing attendants — these are familiar pictures to the readers of the *Phædo*. The sublime pathetic story has moved readers to tears generation after generation. The wonder and beauty of it will shine through the poorest version; and the mysteries of life and death catch some gleams from its glory.

Socrates was no sooner in his grave — 399 B. C.— than the Athenian democracy repented of their sacrifice, and his accusers suffered from the power they had invoked. His martyr death put the seal to his philosophy, and inaugurated the most splendid period of intellectual greatness which the world has yet seen — the philosophical age of Plato and Aristotle. The schools of Athens rose over the grave of Socrates, and for more than a thousand years maintained there the light which his Athenian persecutors only made more conspicuous by their intolerance.

Powerful as was the personal influence of Socrates in his own day, this sinks into insignificance when compared with the vast results of his teaching in after ages. Through his greatest disciple, Plato, his spirit became identical with the spirit of philosophy, and the great schools which sprang up after his death were the offspring of his teaching. As already stated, Socrates committed nothing to writing. He left no books; but the dialogues of Plato — especially the *Crito*, and *Phædo* — may be regarded as the substance of his philosophy. Xenophon, in his *Memorabilia*, has also contributed liberally to our knowledge of the man and his teachings. His work, in general, in its influence on the subsequent course of human thought, may be summed up under three heads: subject, method, and doctrine.

As to subject, he effected a signal revolution, which may be metaphorically expressed in the saying of Cicero, that "Socrates brought down philosophy from the heavens to the earth." The previous philosophies consisted of vast and vague speculations on nature as a whole, blending together cosmogony, astronomy, geometry, physics, metaphysics, into a very imperfect whole. Socrates had studied this system, and it left on his mind a feeling of emptiness and unsuitability for any practical human purpose. He could not go to any public assemblage without hearing questions raised respecting the just and the unjust, the honorable and the base, the expedient and the hurtful. He found, moreover, that the opposing disputants were, without knowing it, very confused in their ideas as to the meanings of those large words in which the weightiest interests entered.

Accordingly, Socrates was the first to proclaim that "the proper study of mankind is man"; human nature, human duties, and human happiness made up a field of really urgent and profitable inquiry. In astronomy, he saw a certain utility for navigation, and for the reckoning of time, to which extent he would have it known by pilots and watchmen; geometry was useful in its literal sense of land measuring; arithmetic he allowed in like manner as far as practically useful; but general physics, or the speculations of philosophers, from Thales downward, as to the origin of all things out of water, fire, air, and so on, he wholly repudiated.

"Do these inquirers," he asked, "think that they already know human affairs well enough, that they thus begin to meddle with divine? Do they think that they shall be able to excite or calm the winds at pleasure, or have they no other view than to gratify an idle curiosity?" He considered it not only unprofitable but impious to attempt to comprehend that department. The gods, he thought, managed all those things after their own fashion, and refused to submit them to invariable laws of sequence, such as men might discover by dint of study; the only means of knowledge permitted was religious sacrifice and prayer, and the consultation of the oracles. While this was the appointed way in reference to divine things, it was equally appointed that human things should be learned by diligence in study and investigation.

In regard to method, Socrates was the author of still greater innovations. It was to little purpose that men applied themselves to human affairs, if they conceived them loosely, and with no regard to evidence. He introduced at least one element of logical precision into the handling of questions, by insisting on accuracy in definition and classification. His mode will be seen in the statement of Xenophon. "Socrates continued incessantly discussing human affairs, investigating — What is piety? What is impiety? What is the honorable, the base? What is the just, the unjust? Men that knew these matters, he accounted good and honorable; men that were ignorant of them, he assimulated to slaves."

His investigation thus took the form of ascertaining the exact meaning — that is, the definition — of the leading terms in ethics and in politics, the settling of what John Stuart Mill calls the connotation of a general word, which determines how to apply it rightly to each individual case. The very idea of defining a general term, now so obvious, never seems to have suggested itself to any one previous to Socrates. His manner of seeking out those definitions is also characteristic, and links itself to his conversational method, convicting men in general of ignorance in things that they thought they knew. Professing himself to be able to furnish no exact definition — which professed ignorance was called the Socratic irony — of justice, temperance, courage, etc., and finding others — particularly the so-called sophists — quite confident in their ability to supply the want, he asked some one to state his definition; and, on its being given, he put a few further interrogations, as he said, by way of making sure that he understood the meaning, but with the speedy effect of driving the respondent into a humiliating self-contradiction.

His method is most fully exemplified in certain of the Platonic dialogues, as the first *Alcibiades*, *Laches*, *Charmides*, or *Euthyphron*. According to Xenophon, he could pass from his severe cross-examining method, with its humiliating shock of convicted ignorance, and address to his hearers plain and homely precepts, inculcating self-control, temperance, piety, duty to parents, brotherly love, fidelity in friendship, diligence, and other virtues — such direct admonitory influence being common to him with the sophists. He probably went beyond the ordinary teaching of the sophists in exhorting men "to limit their external wants, to be sparing in indulgence, and to cultivate, even in preference to honors and advancement, the pleasures arising from a performance of duty, as well as from self-examination and the consciousness of internal improvement." This strain of exhortation, his manner of life in harmony therewith, and the virtual self-immolation of his death may be considered as the foundation of the cynic and the stoic philosophies.

As regards doctrine, Socrates was distinguished chiefly by his theory of virtue. Virtue, he said, consisted in knowledge. To do right was the only road to happiness, and as every man sought to be happy, vice could arise only from ignorance or mistake as to the means; hence the proper corrective was an enlarged teaching of the consequences of actions.

Any fair interpretation of knowledge, however, would now regard this as a one-sided view of human conduct. It takes note of only one condition of virtue. It omits, what is also essential, the state of the emotions or dispositions, which may be directed either to exclusively self-regarding ends, or to ends involving also the good of others. There is an obvious connection between the doctrine and the Socratic analogy of virtue to the professions. The virtue of an artisan is almost exclusively contained in his skill or knowledge; his dispositions can usually, though not always, be depended on, through the pressure of his immediate self-interest. But the practice of Socrates was larger than his theory; for, as already remarked, his exhortations were addressed to men's feelings or sentiments as well as to their intellect. His political doctrines were biased by the same analogy of special professions. The legitimate king or governor was he alone that knew how to govern well.

The philosophy of Socrates is often epigrammatically stated in the injunction: "Know thyself"; but in his teachings equally stand out the formulas: "Virtue is knowledge"; "Virtue may be taught"; "No one wilfully goes wrong"; "Virtue results in happiness."

"There can be no doubt," says the historian Grote, "that the individual influence of Socrates permanently enlarged the horizon, improved the method, and multiplied the ascendant minds of the Grecian speculative world, in a manner never since paralleled. Subsequent philosophers may have had a more elaborate doctrine, and a larger number of disciples who imbibed their ideas; but none of them applied the same stimulating method with the same efficacy; none of them struck out of other minds that fire which sets light to original thought; none of them either produced in others the pains of intellectual pregnancy, or extracted from others the fresh and unborrowed offspring of a really parturient mind."

PLATO

B. C.		AGE
429	Born at Athens, or in the island of Ægina, Greece,	..
409	Came under the influence of Socrates,	20
399	Went to Megara, and resided with Euclid,	30
395	Returned to Athens, after traveling in Italy, Cyrene, and Egypt,	34
389	Visited Sicily,	40
387	Returned to Athens; founded the academy at Athens,	42
367	Made a second visit to Sicily,	62
347	Died at Athens,	82

PLATO, or, to use his proper name, ARISTOCLES, was one of the greatest philosophers of all time; and it is a remarkable circumstance that of the man Plato and of the details of his life we are almost wholly ignorant. His written works have come down to us in singular completeness, and surprisingly free from corruption in the text; but in them he never speaks in his own person, nor is any biographical information about him to be gathered from them. He lived to a great age, in one of the most literary cities of the ancient world, was very widely known and held in highest honor, and for all that we have no information about him bearing the stamp of contemporary authority. No dates are assignable to any of his dialogues with much certainty, so that it is impossible to find in them a clue to the growth of his mind. The philosopher still lives in his works, the man has vanished. As one has said, "There is no personal Plato."

Many interesting particulars of Plato's life, it is true, are given in some extant letters attributed to him; but the genuineness of these letters has been much disputed. The difficulty of the biographer from dearth of facts is increased by the abundance of fictitious stories told by later writers. We therefore give briefly the usually accepted theory of Plato's life.

He was born at Athens, or in Ægina, about 429 B. C., the year in which Pericles died. He was the son of Ariston and Perictione, both of ancient and noble family. His own name was Aristocles, the surname "Plato" being simply applied to him as indicative of his broad forehead — or, as some say, his broad shoulders. His mother's ancestors were connected with the family of Solon, his father's were reputed to be connected with the mythical Codrus. He was a nephew of Critias, one of the thirty tyrants of Athens, and also of Charmides, one of the ten oligarchs. Of robust constitution and thoroughly trained in gymnastics, he could take part in the contests at the Pythian and Isthmian games. His mind was no less carefully cultivated. He made quick progress in his studies, dipped into the current philosophies, and wrote poems, epic, dramatic, and lyrical. These he afterward burned. Some of his epigrams, however, are preserved.

The most important fact in his life, and its dominating force, which took the helm and steered him to the end, was his connection with Socrates. It began when he was about twenty years of age, and terminated only with the death of his master. It remains uncertain whether, as usually supposed, he spent the ten years, from 409 to 399 B. C., in study alone, or in the society of Socrates. It seems hardly possible that in such a crisis he should not have taken, like other young Athenians, his share in military service. He was deeply interested in public affairs, and was no stranger to political ambition. But his truthful and pure nature shrank from contact with the corrupt governments with which he had experience; and he was ultimately driven by the prosecution of Socrates into studious seclusion. After attending his beloved master during his trial and last days, he quitted Athens, resolved to keep clear of politics and to give himself wholly to philosophy.

He retired first to Megara about 399 B. C., then visited Cyrene and Egypt, returning to Athens about 395 B. C.; and some years later he visited Italy and Sicily. In these journeys he met with the Pythagorean philosophers, whose doctrines powerfully influenced his mind. He visited Ætna about 389 B. C., made the acquaintance of Dion, and was introduced to the tyrant Dionysius the Elder. Plato is said to have offended the latter by his bold speaking, and to have been not only sent angrily away, but even sold into slavery. If so, he was soon ransomed, and reached Athens again about 387 B. C.

He now settled there, and began his chosen task as a teacher of philosophy. He had a small house and a garden about a mile from the city on the road to Eleusis. It adjoined the "Academia," the precinct sacred to the hero Academus; and here was founded, says Grote, "the earliest of those schools of philosophy which continued for centuries forward to guide and stimulate the speculative minds of Greece and Rome." Pupils were attracted from all cities and parts of Greece. The greatest among them was Aristotle. Demosthenes may have been there. The great geometrician and astronomer, Eudoxus, was one of them. Plato adopted in his teaching the method of Socrates; and like Socrates he taught gratuitously, receiving remuneration only when offered by the rich. The quiet seclusion of his school presented a striking contrast to the publicity which Socrates sought.

After the death of Dionysius the Elder, Plato, at the instance of his friend Dion, again went to Sicily, about 367 B. C., with a view to assist the younger Dionysius in establishing a better government. The project failed, Dion was banished, and Plato returned home. A second visit likewise ended in failure. These relations with the tyrant of Sicily brought down severe censure on the philosopher; and his last years were saddened both by the disappointment of his high hopes and the reproaches of his enemies. Plato died about 348 or 347 B. C. The school which he had founded and presided over for forty years was carried on in the same place until the siege of Athens by Sulla, 87 B. C., when it was removed within the city. Cicero, it is recorded on good authority, visited the school and the academy.

Plato never married, had no child, took no part in political affairs or in social gayeties. He lived the life of thought, and his habitual seriousness passed into the proverbial expression —"as sad as Plato."

Plato's life coincided with the most eventful period of Greek history. Not long before his birth the Peloponnesian war had begun, which, after confused struggles protracted through a quarter of a century, ended with the fall of Athens in 404 B. C. The tyranny of the thirty, the restoration of the democracy, and the death of Socrates followed within the next few years. During the period of ten years following Plato's death the most memorable change in Greek history was the extension of the Macedonian power under Philip of Macedon, who, in 338 B. C., became master of the whole of Greece.

Plato survived Socrates about fifty years, and all his works were composed during this period. He was the most Socratic of all the disciples of Socrates; and his reverence for his master is shown by the place assigned to him in his works. These are all in the form of dialogues, of which, with one exception, Socrates is the central figure, the speaker of all thought-out conclusions. Each dialogue is an independent work, and inconsistencies are to be found not only between separate dialogues, but even within the limits of a single one. Attempts have been made to classify these works, both logically and chronologically, but without success. In range of speculation, and in the harmonious union of the philosophic with the poetic spirit, the works of Plato stand alone.

First of all come those short dialogues in which Plato does not go beyond what the actual Socrates might have said. The most important of this group is the *Protagoras.* The *Apology*, or "Defense of Socrates on his Trial," has probably more historical accuracy than any other composition of Plato's — since he tells us he was present at the trial — and may have been written soon after Socrates' death. The *Phædo* — the last conversations of Socrates, on the immortality of the soul — is probably of later date. Some modern scholars assign the great metaphysical dialogues — *Parmenides, Theætetus, Sophistes,* *Politicus* — to the time, between 399 and 386 B. C., when Plato began his teaching at the academy. Others, with more probability, consider these dialogues and the *Philebus* to belong to a later period than the *Republic*. The *Phædrus*, *Symposium* ("Banquet"), *Gorgias*, *Republic*, and *Phædo*, in which — along with the *Theætetus* — Plato's literary skill is at its very highest, may perhaps all be assigned to the period of his life after forty, but before his old age. The works that give the fullest account of his philosophical and social system are the *Republic*, the *Timæus*, and the *Laws*.

As with Socrates, so with Plato the aim is not so much to teach particular truths as to stimulate inquiry and impart a method. Idlers were warned away from the severe intellectual discipline of the academy by the inscription over its entrance, "Let no one enter who is not a geometrician." The severity of thought in Plato's writings is, however, relieved by the charm of inimitable style, by consummate dramatic art, and by the play of fancy and imagination. A light, buoyant humor, irony, sarcasm, banter, now broad and now delicate, picturesque illustration, and occasionally elaborate and gorgeous fable, alternate with and relieve the stern reasoning processes.

The starting point of Plato's philosophy, as, indeed, it must be of all philosophy, properly so called, is the theory of knowledge. This is set forth in the *Theætetus*, the *Sophistes*, and the *Parmenides;* and in the *Cratylus* the foundations are laid for a science of language, as the necessary product of a creature energizing by ideas. The Platonic theory of knowledge, as developed in the *Theætetus*, embraces one of the most constant and notable of Plato's doctrines — that of ideas. He makes no formal division of philosophical science, but evidently regards it substantially under the threefold division of logic (or dialectics), metaphysics, and ethics or politics. Dialectics he regarded as a science *par eminence*, and it was through its process that the mind, according to his reasoning, reached its conception of ideas.

By ideas he meant the essences, or eternal archetypes, of which all merely outward, ever-changing objects are but copies or likenesses, and the innate notions of which in our minds are recollections awakened by means of perception of these copies. In other words, they are forms or types of things which are common to all individuals of a species, all the species of a genus, all the genera of a family, and all the families of a class, generate classification — that is, knowledge of the permanent in phenomena — and definition, which is merely the articulate verbal expression of this permanency. They pervade the world of sense, yet are not sensation, being, as it were, the substance of which it is the shadow, giving to it whatever of partial reality it possesses. A man only knows when he has gotten at the reasons or causes of things, when he sees facts not in an isolated way, but connected by the "chain of causation"; he must be dealing with what is permanent and universal.

According to Plato, both the one (the permanent) and the manifold (the changing) have their place in the universe, the former in the world of ideas, the intelligible world, with which science deals, the latter in the world of sense, with which mere opinion is content. These ideas are not mere concepts of our minds: they are, in Plato's phrase, "the most real existences."

Every general term, as horse, man, table, denoting a group of objects, had in Plato's philosophy a real existence corresponding to it, of which any particular horse, man, or table was but an imperfect transitory copy. Men when uneducated were like dwellers in a cave chained with their backs to its mouth. A fire behind them threw shadows of passing objects on the ground before them, and these shadows they took for the realities of things. A prisoner, set free from the cave and taken to the daylight, would be dazzled and blinded, and it would be long before he got to know about real objects, and about the sun which gave them light, and brought the changes of the seasons, and growth and life in the world. If such a man went down again into the cave he would be again blinded; none of his fellow prisoners would believe his visions, and he would be less able than they to discourse eloquently about shadows. Such is the contrast between the trained mind of the philosopher, cognizant of ideas, and the untrained mind of the multitude.

The ideas, however, are not themselves all of equal excellence; but supreme above the others are the forms of the true, the beautiful, and the good, in which triad again the last takes the highest place, and becomes perhaps identical with the deity, who thus, under the Platonic conception, seems to fluctuate between a personal being and the highest and noblest of the ideas. And as the ideas are the only object of true science, and preparation to commune with them, especially with the good, the noblest of them all, is the great end of philosophical striving, so in the last analysis science and virtue coincide, and the ideas furnish the basis not only of all science, but of piety and morality. He does not accept the Cyrenaic view that pleasure is the good; but neither does he agree with the cynics that all pleasure is evil. Pleasures are good or bad, high or low, according to the part of the soul to which they belong.

The *Republic*, starting from the attempt to prove that righteousness is preferable to uprightness, whatever pains and calamities may go with the first, or pleasure with the second, depicts an ideal government, in which the governing class, corresponding to the reasoning faculty in man, is trained and educated for the work in the most perfect way. For this class the institutions of private property and the family are to be suppressed. The children are to be children of the state. Both sexes are to receive the same gymnastic and intellectual training. In the education of their intellect the great object is to set them free from the tyranny of sense and prepare them for the perception of ideas.

The object of all wise polity, therefore, is that philosophers should be the governing class because of their powers to estimate at their true worth the shadowy pursuits and pleasures of the multitude. His picture of the ideal state has won for Plato the distinction of being the first scientific socialist, inasmuch as the individual and the family, marriage, property, and all are to be sacrificed to the interests of the state. The work is pervaded by a profoundly religious spirit.

In the *Timæus* a description is given of the origin of the universe and of the human body. Plato here introduces his conception of the *Demiurgus*, or constructive workman, who, by impressing the eternal forms or ideas upon preëxistent formless matter, produced the second order of gods, the stars and planets, by whom afterward man with his mixed nature, compounded of earthly and divine, was created. It was this treatise that convinced the Alexandrine Jews and Christians that Plato had borrowed his leading conceptions from Moses.

In the *Laws*, Plato portrays a commonwealth, not purely ideal as in the *Republic*, but such as might be actually realized in the Grecian world. He supposes it to be a colony founded in the island of Crete, and composed of settlers representing all varieties of the Hellenic race. He enters into minute details of legislation and of education, from which we gather that his guiding principle was to secure stability even at the risk of tyranny. No great public reform, he says, can be accomplished without large interference with public and private life. Private property is to be allowed, but is to be fenced in with restrictions that few socialist schemes have exceeded. The number of landholders is to be rigidly fixed; marriage is to be compulsory, the number of children strictly limited; and one son only is to succeed to the landed property of the father. But, above all, everything connected with education and religion is to be sedulously guarded from change.

As in Egypt, so in Greece, according to the *Laws*, all songs, dances, and festive ceremonies must first receive the approval of official censors, who are to be men above the age of fifty, and when so approved must never afterward be changed. All the existing dramatic literature of Greece must be freely and systematically expurgated. Much reading of any kind is to be discouraged. Arithmetic, geometry, and astronomy are to be taught, not for their practical utility, but to inspire true thoughts as to the universe and the great divinities, the sun, moon, and planets. The belief that the planets moved irregularly should be regarded as blasphemous. Bodily exercises, under the same stringent relations, are to be systematically encouraged in both sexes, and their efficacy in restraining sexual impulse is strongly insisted on.

In his criminal legislation, heresy — that is, erroneous beliefs about the gods — occupies a very prominent place. Even when the life has been morally blameless, the punishment is five years' imprisonment, persistence in unbelief being punishable with death. Heresy, combined with vicious conduct, sorcery or charlatanry, is punishable as the worst of crimes. It is certain that the legislation here proposed by Plato would have condemned Socrates, his great preceptor, many times over.

Plato is often styled an idealist. But this is true of the spirit rather than of the form of his doctrine; for strictly he is an intense realist, and differs from his great pupil, Aristotle, far less in his mere philosophical method than in his lofty moral and religious aspirations, which were perpetually winging his spirit toward the beautiful and the good. In other words, the philosophy of Plato is essentially a poetical and an artistical philosophy; for poetry, painting, and music all grow out of idealism, or those lofty inborn conceptions by which genius is distinguished from talent. It is also, at the same time, a scientific philosophy, for the purest science, as mathematics — on which Plato is well known to have placed the highest value — is a science of mere ideas or forms conditioned by the intellect which deduces their laws; and, above all, it is essentially a moral and a theological philosophy, for practice, or action, is the highest aim of man, morality is the ideal of action, and God, as the cause of all, is the ideal of ideals.

Neither Plato nor any of the great Greeks looked on their intellectual exercises and recreations as an end in themselves. With them philosophy did not mean mere knowledge or mere speculation, but it meant wisdom, and wisdom meant wise action, and wise action meant virtue. The philosophy of Plato, therefore, with all its transcendental flights, of which we hear so much, was essentially a practical philosophy. All his discussions on the theory of knowledge and the nature of ideas are undertaken mainly that a system of eternal divine types, as the only reliable knowledge, may serve as a foundation for a virtuous life, and the only consistent course of action. Virtue, with Socrates and Plato, is only practical reason. As in the proverbs of Solomon all vice is folly, so in the philosophy of Plato the imperial virtue is wisdom or practical insight. The other two great Greek and Platonic virtues — moderation or soundmindedness, and justice, or the assigning to every act and every function its proper place—are equally exemplifications of a reasonable order applied to action, such an order as alone and everywhere testifies the presence of the mind.

The theory of morals as worked out from such principles is, of course, as certain as the necessary laws of the reason which it expresses; and, accordingly, the Platonic morality, like the Christian, is of that high order which admits of no compromise with passing prejudice or local usage. The contrast between the low moral standard of local respectability and that which is in harmony with the universal laws of pure reason stands out as strikingly in Plato as the morality of the sermon on the mount in the gospels does against the morality of the Scribes and Pharisees. Splendid passages to this effect occur in various parts of Plato's writings, particularly in the *Republic* and the *Gorgias*.

In perfect accord with the Platonic theory of noble action is his doctrine with regard to pure emotion and elevated passion. Love with Plato is a transcendental admiration of excellence — an admiration of which the soul is capable by its own high origination and the germs of godlike excellence, which are implanted into it from above. The philosophy of love is set forth with imaginative grandeur in the *Phædrus*, and with rich dramatic variety in the "Banquet," of which dialogue there is an English translation by the English poet, Shelley.

In his works, also, we find the first formal development of the spirituality of the soul, and the first attempt to demonstrate its immortality. His moral conclusions are of the loftiest and most rigorous character, and are announced clearly, positively, and persistently. In some cases his teaching is a surprising anticipation of a higher doctrine that was to come. A tendency to a trinity of doctrines runs through it all. In psychology we have the trinity of reason, passion, and appetite; in ethics, of wisdom, courage, and temperance; in ontology, of being, becoming, and not being; in knowledge, of science, opinion, and sensation; in cosmogony, of God, the soul of the world, and matter; in the state, of magistrates, warriors, and laborers. So remarkable was this fact to early Christian thinkers that they readily accepted by way of explanation the story of his eastern travels and communication with the Jews. The same fact led Coleridge to speak of him as "that plank from the wreck of paradise thrown upon the shores of idolatrous Greece."

The influence of Plato's thoughts on succeeding centuries was great and prolonged; but it was largely due to the dramatic skill and poetic style in which they were delivered. To the building up of human life on the basis of science they contributed nothing. But they inspired ardor for social regeneration; and when transplanted into the soil of Alexandria they formed one of the channels through which Jewish and Christian thought penetrated into the western world. His works were extensively studied by the church fathers, one of whom joyfully recognizes, in the great teacher of the academy, the schoolmaster who, in the fullness of time, was destined to educate the heathen for Christ, as Moses did the Jews.

His philosophy disappeared from the world for a time, with Proclus, the last Platonist of the famous Alexandrian school, about the close of the fifth century, when his works were brought to Italy and expounded at Florence by learned Greeks from Constantinople. In the intervening ten centuries the seat of philosophy was usurped by the offspring of Catholic theology and Aristotelian logic, scholasticism; and his doctrine of ideas formed the basis of the famous controversy during the middle ages between realist and nominalist.

After the French revolution, particularly, the study of Plato was pursued with renewed vigor in Germany, France, England, and America; and many distinguished authors, without expressly professing Platonism — as Coleridge, Wordsworth, Mrs. Browning, Ruskin, and others — formed a strong and a growing party of adherents, who could find no common banner under which they could at once so conveniently and so honorably muster as that of Plato.

More important, perhaps, than any results, either moral or metaphysical, which have been brought to maturity by Plato, are the inexhaustible germs of latent wealth which his writings contain. Every time his pages are turned, they throw forth new seeds of wisdom, new scintillations of thought — so teeming is the fertility, so irrepressible the fullness of his genius. All philosophy, speculative and practical, has been foreshadowed by his prophetic intelligence, often dimly, but always so attractively as to whet the curiosity of those who have chosen him for their guide.

To whatever censure his philosophy may be justly exposed, we cannot sufficiently applaud that seducing eloquence, which Quintilian has called "Homerical," and that beauty of style which appeared so admirable to Cicero that he declared, "If Jupiter himself had been willing to adopt the language of mankind, he would have spoken as Plato wrote."

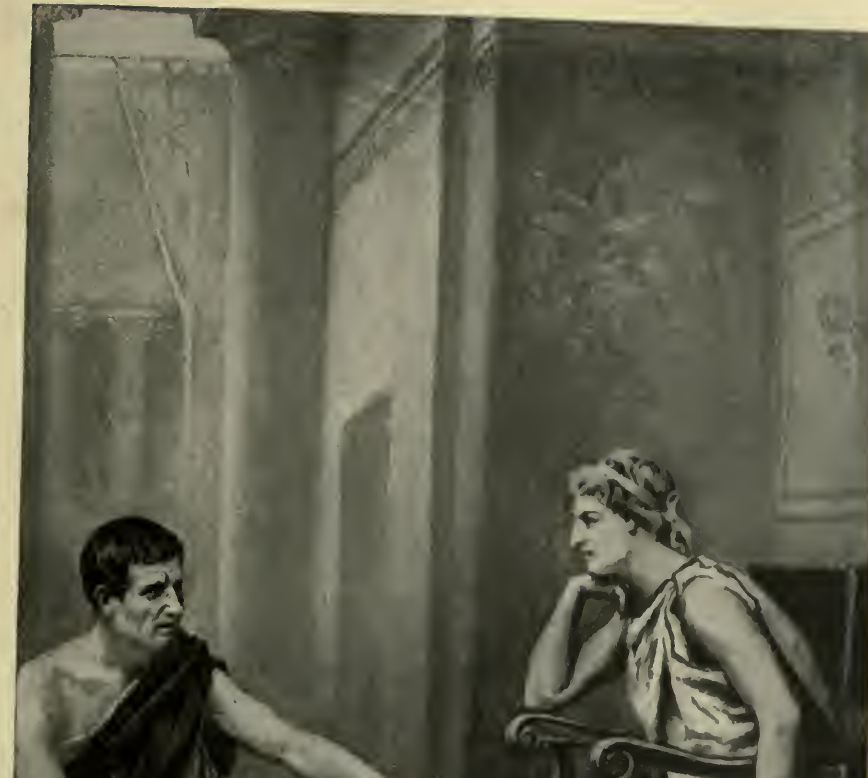
ARISTOTLE

B. C.		AGE
384	Born at Stagira, Macedonia,	..
367	Went to Athens,	17
364	Began study under Plato,	20
347	At death of Plato went to Atarneus,	37
344	Visited Mitylene,	40
342	Invited to court of Philip of Macedon; teaches Alexander the Great,	42
338	*Rhetoric*,	46
334	Returned to Athens; opened his school,	50
323	Accused of impiety; escaped to Chalcis,	61
322	Died at Chalcis,	62

ARISTOTLE, founder of the celebrated peripatetic school of philosophy at Athens, and one of the greatest intellectual forces in the history of the world, was born at Stagira, Macedonia, in the year 384 B. C. He belonged to a family in which the practice of medicine seems to have been hereditary. It is asserted that on the side of his mother, Phæstis, he was a descendant of Esculapius. His father, Nikomachus, was the friend and physician of Amyntas II., king of Macedonia, father of Philip of Macedon, and grandfather of Alexander the Great.

Aristotle lost both his parents while he was quite young, and was brought up under the care of Proxenus, a prominent citizen of Atarneus, a city in Asia Minor. When he had completed his seventeenth year, he repaired to Athens, then the intellectual center of the entire civilized world, as well as of Greece. Plato, with whom he doubtless intended to study, was then absent in Syracuse as adviser at the court of Dionysius. Aristotle therefore pursued his studies by means of books, and with the aid of other teachers that he could find, during the first three years of his stay. On the return of Plato, he placed himself under his instruction, and soon made his master aware of the remarkable penetration and reach of his intellect. Plato spoke of Aristotle as the "intellect of the school," and he rapidly gained a place of honor and distinction in the estimation of both his great teacher and his companions.

He remained at Athens twenty years,



ARISTOTLE TEACHING ALEXANDER THE GREAT
From the painting by J. L. G. Ferris

during which the only facts recorded, in addition to his studying with Plato, are that he set up a class of rhetoric, and that in so doing he became the rival of the celebrated orator and rhetorical teacher, Isocrates, whom he appears to have attacked with great severity. It was in the schools of rhetoric that the young men of Athens received the principal part of their education for public life. They learned the art of speaking before the dicasteries, or courts of law, and the public assembly, with force and elegance; and incidentally acquired the notions of law and public policy that regulated the management of affairs at the time. We can easily suppose that Aristotle would look with contempt upon the shallowness — in all that regarded thought or subject matter — of the common rhetorical teaching, of which, doubtless, the prevailing excellence would lie in the form of the address being artistic rather than profound or erudite. One of the disciples of Isocrates, defending his master against Aristotle, wrote a treatise wherein allusion is made to a work — now lost — on proverbs, the first recorded publication of the philosopher.

The death of Plato in 347 B. C. was the occasion of Aristotle's departure from Athens. It was not extraordinary or unreasonable that Aristotle should hope to succeed his master as the chief of his school, named the academy. We now know that no other man then living had an equal title to that preëminence. Plato, however, left his nephew, Speusippus, as his successor. We may suppose the disappointment thus arising to have been the principal circumstance that determined Aristotle to stay no longer in Athens. There are also other reasons that may be assigned, arising out of his relations with the Macedonian royal family at a time when the Athenians and Philip of Macedon had come into open enmity.

Whatever may be the explanation, he went in his thirty-seventh year, after a stay of nearly twenty years in Athens, to the Mysian town of Atarneus, in Asia Minor, opposite the island of Lesbos. Here he lived with Hermeias, the chief of the town, a man of singular energy and ability, who had conquered his dominion for himself from the Persians, at that time masters of nearly all Asia Minor. Aristotle had taught him rhetoric at Athens, and he became in return the attached friend and admirer of his teacher.

At this small but interesting court, surrounded by the scenes of his early studies, Aristotle spent three happy years, enjoying the society of intellectual friends, and devoting himself with unremitting assiduity to the study of nature. Here, too, he had formed ties warmer than those of friendship. Pythias, the niece of the king, had gained his affection, and when the unfortunate sovereign had been betrayed by some worthless individuals who had enjoyed his hospitality, and had forfeited his life as a rebel against the king of Persia, Aristotle fled to Lesbos with the family of his friend, and was soon afterward married to his niece. In a noble ode he has commemorated the merits of the friend and benefactor who was thus lost to him through the treachery of a Greek renegade. His wife, Pythias, died about ten years later in Macedonia, leaving him a daughter of the same name, and a son, Nikomachus. To his son Aristotle dedicated his chief works on ethics — called, from that circumstance, the *Nikomachean Ethics*.

During his residence at Mitylene, in Lesbos, to which he went about 344 B. C., Aristotle seems to have received from Philip, king of Macedon, the flattering invitation to superintend the education of Alexander, his son. The compliment thus paid to his talents and character was too high to be rejected; and, though the duties which such an office demanded might have interfered with the progress of his studies, he cheerfully accepted it, and took up his residence at Pella, in 342 B. C., when Alexander had reached his fourteenth year. The king received him with the most marked attention, and science and learning have in no future age been more highly honored than they were in the court of Macedon in the person of the distinguished Stagirite, and through the liberality of the most powerful of sovereigns.

The Macedonian prince was instructed during five or six years in grammar, rhetoric, poetry, logic, ethics, and politics, and in those branches of physics which had even at that time made some considerable progress. Aristotle made a new collection of the *Iliad* for the use of his pupil, wrote his *Rhetoric*, in 338 B. C., and composed a treatise, *On a Kingdom*, which has not descended to our times. After the death of Philip in 336 B. C., Alexander succeeded to the throne, when in the twentieth year of his age, and Aristotle continued to live with him as his friend and counsellor until Alexander set out on his Asiatic campaign in 334 B. C., when he returned to Athens.

The delicate constitution and intellectual habits of the philosopher prevented him from following Alexander on his career of military conquest, and he accordingly returned to a less strenuous life.

At the age of fifty, Aristotle now entered upon the final epoch of his career. He opened a school called the Lyceum, from the proximity to the temple of Apollo, and here in this charming retreat he delivered his lectures to crowded audiences, while walking in the shade, amid the trees and fountains with which it was adorned. From his habit of walking up and down in the garden during his lectures arose the other name of his school and sect, the peripatetic. It would appear to have been his custom to give a morning lecture to select pupils on the more obtuse subjects, and one in the evening of a more popular kind to a general or mixed audience. At this time, too, it is supposed he composed his principal writings; but unfortunately there is nothing known definitely concerning the dates of any of them.

While thus instructing his pupils, and enjoying the popularity and reputation to which he had attained, he became, like all illustrious teachers of philosophy, the object of envy and persecution. His rivals in learning directed against him the usual calumnies which genius is ever destined to endure from the ignorance and malice of its enemies; and the heathen priests, dreading the progress of truth as the greatest enemy of their faith, charged the philosopher with impiety and sedition. The friendship of Alexander had hitherto shielded him from open persecution, but upon the death of that monarch, in 323 B. C., he was charged before the Areopagus as an enemy of the religion of his country, and avoided the fate of Socrates, which he knew awaited him, by making his escape to Chalcis, a city of Eubœa. In this city of refuge he spent the remainder of his life, that the Athenians might not, as he said — alluding to the death of Socrates — be guilty of "twice sinning against philosophy." Exhausted with mental labor and broken in spirit by his misfortunes, his feeble constitution gave way, and he died in 322 B. C., in the sixty-third year of his age, about a year after his retreat to Chalcis.

His remains were carried to Stagira by his fellow citizens, and an altar and shrine erected over his grave. The festival of Aristotelia was instituted in gratitude for his services, and even in Plutarch's time the garden of the philosopher, with its walks and bowers, was exhibited to the public.

In his personal appearance, Aristotle was not attractive. He is described as having small eyes and slender limbs, with a feeble voice and an imperfect utterance; and he is said to have improved the symmetry of his person by great attention to dress, and the use of elegant ornaments. His character seems to have been in every way estimable. In his friendships he was constant and glowing. In his will — which is preserved to us in the biographies of Laertius — he shows affectionate thought for each member of his family, and grateful remembrance of those who had died before him. His household servants were not forgotten, and were to be set free from bondage.

It is often but erroneously said that "Plato was an idealist, Aristotle an empiricist"; the difference is great in appearance mainly. Sir Alexander Grant truly declared that "Aristotle codified Plato." Plato was a poet, and is always an artist, as well as a thinker, in his dialogues. Aristotle, with the education of a physician, has the mental habits and tendencies of the man of science predominant; and, while lacking Plato's inspiration and enthusiasm, has a wider, in fact, an all-embracing range of interests, and cares more for actual facts for their own sake.

He appears to have projected what may be called an encyclopædia of philosophy, though the scheme is only imperfectly carried out in his works. The most important of Aristotle's writings bear the titles of *Organon*, or "Logic"; *Rhetoric; Poetics; Ethics; Politics; History of Animals; Physics; Metaphysics; Psychology;* and *Meteorology.*

It is impossible to read even the titles indicative of the range of research accomplished by a man whose life reached only to sixty-two years, without the profoundest astonishment. Perhaps no better illustration is furnished by history, of the great truth that universality is an unfailing characteristic of loftiest geniuses — not universality as to information, but universality as to thought — than in his case. It may be said with justice that there was not one subject of interest mooted in his day, which Aristotle did not touch and adorn. He laid, besides, the foundations of many new sciences. He divided his philosophy into three departments: theoretic, embracing physics, mathematics, theology, and metaphysics; efficient, including logic, rhetoric, and poetry; and practical, including ethics and politics. He distinguishes three branches of theoretical philosophy: (1) Physics — the study of sensible material, particular things, each of which differs from every other, and all of which have in themselves the principle of change or motion. (2) Mathematics — that of geometrical and numerical entities known by general definitions, susceptible neither of change nor of movement, capable of being considered and reasoned upon apart from matter, but not capable of existing apart from matter. (3) The first or highest philosophy — which studies the essence of things eternal, unchangeable, and apart from all that change, movement, and differentiation which material embodiment involves.

His writings on mathematics have not come down to us, and his work on physics had mainly to do with the metaphysical aspects of movements, or motion. In his time the value of experiment was not recognized, nor its methods understood, as we now understand them. Yet even in these treatises his marvelous sagacity is evident and he foreshadowed some remarkable modern discoveries. Although he saw the importance of discovering the laws of motion, his own crude attempts to solve the problem rested either on such purely metaphysical conceptions as that of the inherent perfection of circular motion, or on the definite but untrue hypothesis that the velocities of falling bodies varied as the distance traversed. This last was at least a useful starting point for the more fruitful efforts of Kepler and Galileo.

The metaphysics, or first philosophy, deals with the extreme abstractions or generalities of all sciences. It is a collection, partly of doubts and difficulties, partly of attempted solutions, upon these last refinements of the human mind. It includes many valuable comments on the philosophy of Plato and others anterior to or contemporary with Aristotle. The general terms and subtle distinctions, which this treatise first brought to view, were highly prized throughout all the philosophy of the middle ages.

His *Organon*, or "Logic," is his complete development of formal reasoning, and is the basis and nearly the whole substance of syllogistic or scholastic logic. This science he almost entirely created. Grote observes that "what was begun by Socrates, and improved by Plato, was embodied as a part of a comprehensive system of formal logic by the genius of Aristotle; a system which was not only of extraordinary value in reference to the processes and controversies of its time, but which also, having become insensibly worked into the minds of instructed men, has contributed much to form what is correct in the habits of modern thinking. Though it has now been enlarged and recast by some modern authors — especially by John Stuart Mill in his admirable *System of Logic* — into a structure commensurate with the vast increase of knowledge and extension of positive method belonging to the present day — we must recollect that the distance between the best modern logic and that of Aristotle is hardly as great as that between Aristotle and those who preceded him by a century — Empedocles, Anaxagoras, and the Pythagoreans; and that the movement in advance of these latter commences with Socrates."

His philosophical method, in brief, consists in the principle that all our thinking must be founded on the observation of facts. Logic is the fundamental science, and the principles which he laid down for it have never been superseded, or even advanced, as acknowledged by Kant and Hegel. He invented the categories, or fundamental forms of thought, and devised the so-called syllogistics, or science of forming correct conclusions. He likewise became the father of modern psychology, showing how the mind creates its speculative methods and general notions; and that though we cannot prove their correspondence with the reality, as transcending our senses and observation, yet we are compelled to take them for indispensable forms of thinking. He first discriminated between the substance of things and their accidental peculiarities, and created the philosophical notions of matter and of form. He also established the philosophical notions of space and time, and argued that back of the infinite series of finite causes there must be an infinite immaterial something, unmoved, all-moving, pure energy, absolute reason, God.

Not until we reach what may be termed the natural history of Aristotle do we find his full powers of generalizing and coördinating, based on minute and accurate observation of fact. He was the first careful observer, dissector, and describer of animals. He first divided the animal kingdom into classes, discriminated between the several faculties, the nourishing, feeling, concupiscent, moving, and reasoning powers of animal organism, attempted to explain their origin within the body, and built his moral and political philosophy on the peculiarities of human organization. A fourth part of his writings is occupied with the study of living bodies. Many of his conclusions have required the knowledge of the present century for their just appreciation. "I cannot read this book," says Cuvier, "without unbounded wonder. It is indeed impossible to conceive how one man was able to collect and compare the multitude of special facts, and the mass of aphorisms contained in it — of none of which his predecessors had the remotest idea. The 'History of Animals' is not a zoölogy, commonly so called — that is to say, a mere description of various animals. It is nearly a general anatomy, in which the author treats the generalities of the organization of animals and in which he exposes their differences and resemblances, as indicated by a comparative examination of their organs — thus laying the true basis of all grand classifications."

He grasped and applied the comparative method with extreme breadth and vigor. He anticipated Lamarck's division of the animal kingdom into vertebrate and invertebrate. In each sub-kingdom he defined the principal groups not less clearly. In vertebrates he distinguished mammals, birds, reptiles, fishes. Of mammals he defined most of the leading groups, arranging them by the character of their locomotive organs and of their dentition, the connection of dentition with the digestive apparatus being clearly apprehended. The mammalian characters of the whale tribe were perfectly well known to him. Among invertebrates, his minute study of cephalopods is specially noteworthy. Seven at least of the species described by him are recognized by modern naturalists.

In embryology, Aristotle had observed the first appearance of the heart in the development of the chick. Of histology he may be regarded as the founder. His history of animals begins with the explicit distinction between the tissues of which animal structure is built up, and the organs compounded from those tissues: a distinction unappreciated until Bichat made it the foundation of his *Anatomie Générale.*

Perhaps one of Aristotle's greatest works is his *Politics*. This treatise is the thoughtful and compressed result of his lost collection of upward of one hundred fifty actual constitutions, and is one of the works in which his penetrating genius is the most clearly revealed. There is nothing to which it is more unlike than a book of description. It is a methodical deduction of great principles of government, a discrimination of the principles underlying every form of government, and a prophetic declaration concerning their comparative stabilities. A few remarks in this precious volume made the fortunes of Machiavelli and Montesquieu; nor has even Rousseau in the *Contrat Social* escaped its all-pervading influence. Every framer of a *Utopia* has borrowed from Aristotle; but in itself his treatise on *Politics* is not utopian. The book is the result of experience, of the widest research and impartial reflection, and it will continue a great classic so long as man remains as he is.

His works on *Rhetoric* and *Poetics* were the earliest development of a philosophy of criticism, and still continue to be studied. Even more so are his elaborate disquisitions on ethics still made the subject of immense study and interpretation. The subject matter of this final science was rightly conceived by him as the conduct of the individual moulded by the social state. Apart from a social environment there could be, he clearly saw, no moral life. His scheme of politics is thus an appendage to his ethics, intended to examine and describe such an environment. For moral exhortation or discussion would be, he says, thrown away on men unprepared by the discipline of life to give reason precedence over passion.

The end of ethical inquiry, he points out, is practical rather than speculative. Our object here is not to acquire knowledge, but to become better men. Whatever general principles we may reach, we come at last, like physicians or navigators, to cases that have to be judged individually.

He begins by explaining that all men, consciously or otherwise, have an aim in each action, the special aim being subordinate to one still larger, and so on. The ultimate aim, consciously or unconsciously pursued, is happiness. Wherein consists true happiness? It consists in a life of noble activity. For perfect happiness the outward conditions must be favorable. Still, whatever misery may come, "the blest one can never become wretched, for he can never do hateful or worthless things."

What is to be our canon of right action? Aristotle wisely declines to lay down such a canon. We become just and righteous, he says, not by listening to ethical discourses, but by doing just and righteous things; and these things are those that just and righteous men do. Subject to this warning against overtrust in theory, he defines virtue as the state in which we use our free choice to avoid excess on the one hand, or defect on the other, as defined by right reason and the practice of wise men.

A large part of his ethical treatise is occupied with illustrations of this in detail. Courage, temperance, liberality, magnanimity, mildness of temper, geniality, truthfulness, graciousness, are analyzed and contrasted with the vicious states of exaggeration or defect between which they stand. The discussion of justice, temperance, and friendship is carried out with special care. His manner of contrasting the false friendships of pleasure and interest with the perfect friendship following from intercourse of noble natures, wishing good for one another in that they are themselves good and pure, is but one of many signs that the heart of this great thinker was worthy of his intellect. Not less striking are his remarks on self-love, which, in its highest form, meant love for what was best in self; readiness to throw life away, if need were, at the call of duty; to do one great and noble deed rather than many small ones; to choose noble life for a year above many years of mediocrity.

He ends, as he began, with renewed insistence on the need of moral discipline begun in early life. The whole environment must be such as to predispose to the love of good and hatred of evil.

No other philosopher ever exerted so large an influence on so many centuries and nations as Aristotle. His greatness was not recognized until the middle ages. The Greek world, politically degenerated, at the time of his death and after, looked on Plato, and men far weaker than Plato, as his superiors. By a strange incident his principal works, intrusted to his disciple, Theophrastus, disappeared from view for two centuries, until brought to Rome by Sulla and edited by Andronicus. In the turmoil of barbarian invasion, and during the building up of the Christian church, his name was forgotten, except by a few obscure writers in Constantinople, until the great Mohammedan schools arose in Baghdad and Cordova. Averroës, mentioned by Dante as the great Aristotelian commentator, and the Jew, Maimonides, were his principal introducers to the western world.

From the twelfth to the fourteenth century his metaphysical system became, in the hands of the schoolmen, the basis of Catholic theology. It gave birth to the celebrated discussion between nominalism and realism, and to all the teaching of Abelard.

Albertus Magnus commented on the whole works of the Stagirite; Thomas Aquinas explained some of their more difficult portions; a crowd of illustrious doctors immediately followed their example; and Aristotle, translated by care of Pope Urban V. and of Cardinal Bessarion, became forthwith, in respect to science, that which the fathers of the church, or even scripture itself, were in relation to faith. No one, apparently, was allowed to think otherwise than with Aristotle, and every doctrine set up against one of his was practically equivalent to a heresy.

But what is curious respecting the influence of Aristotelianism is that, after some hesitation, Protestantism adopted Aristotle as ardently as the Catholic church. Melanchthon introduced his writings into the Lutheran schools. The society of Jesus adopted the peripatetic philosophy in its entireness; and, with its peculiar ability, turned it against all bold thinkers of the time and especially against the adherents of Descartes.

It was not until the eighteenth century — a century victorious over so many other abuses — that this one also came to an end. Aristotle reigned no more, except in colleges and seminaries; the manuals of philosophy in use among ecclesiastical establishments were, and still are, nothing but a dry résumé of his doctrine. But the general reaction went to excess, in spite of the wise counsels of Leibnitz; the Stagirite was treated with that unjust disdain with which men had begun to regard the whole past. Even the gravest historian of philosophy could not do him justice. The yoke had been broken too recently, and men could not forget how oppressive it was.

At last, however, Aristotle again assumed the place in philosophy which was unquestionably due to him. Kant and Hegel, in Germany, Cousin, in France, Sir William Hamilton, in Great Britain, gave a tremendous impetus to the study of Aristotle, with the result that the great doctrines of the Greek philosopher are probably now better known and more accurately appreciated than at any other time in the history of thought. As the founder, too, of biological and social science, his influence has passed far beyond the limits of his pure philosophy, both theoretical and practical.

There is no work he ever wrote which may not nourish and inspire every searcher after truth and correct method. There are many of them, such as the *Organon*, wholly above reach of cavil, which must remain a necessity for all sects and all men, as well as for all time; and he must be regarded as one of the greatest glories of Greece. If men have freely dissented from him, his own words are ample apology: "It is best to examine theories carefully and narrowly, even though philosophers who are very dear to us have espoused them. It is best also to put aside personal feelings, and to think only of the truth. Both are dear, nevertheless it is a sacred duty to give preference to the defense of truth."

ST. THOMAS AQUINAS

A. D.		AGE
1227	Born at Rocca Secca, near Aquino, Italy,	..
1240	Studied at Naples,	13
1243	Entered the Dominican order,	16
1244–48	Studied at Cologne and Paris,	17–21
1253	Taught and studied at Paris,	26
1257	Doctor of theology at Paris,	30
1261	Summoned to Rome by Pope Urban IV.,	34
1269	Returned to Paris,	42
1272	Settled at Naples,	45
1274	Died at Fossa Nuova, near Terracina,	47

THOMAS AQUINAS, or THOMAS OF AQUINO, was the most famous representative of the scholastic philosophy, and one of the greatest of all theologians. He belonged to the great feudal family of the counts of Aquino in the kingdom of Naples, and was born at the castle of Rocca Secca, near the famous monastery of Monte Cassino, in 1227. His father was a nephew of Frederick Barbarossa, and he was thus related, also, to the emperor Frederick II. of the holy Roman empire.

Thomas received his earliest instruction at Monte Cassino, whence he passed, about 1240, to the newly-founded university of Naples. A thoughtful boy, fond of study from his earliest years, he was not eager to run with others the race of worldly ambition or to fight his way with the sword to honors and rewards. These things he rather shunned, and turned with longing to the secluded quiet of the monastic life, of which he had already seen something. Without the knowledge of his family he entered, in his sixteenth year, the Dominican convent at Naples, and steadfastly resisted all endeavors to change his purpose. It is said that when he was sent to France he was seized, soon after setting out, by his two brothers, who kept him in confinement for a year or more, until his release was ordered by the emperor.

He made profession as a Dominican in 1243, and then became a pupil of Albertus Magnus, or Albert the Great, at Cologne. From this master he learned the doctrine which he afterward taught, but in a form more precisely and decisively elaborated. Among his fellow students his modesty and silence procured for him the nickname of "the great dumb ox of Sicily." But when on one occasion a test was applied to his knowledge and capacity, they found they were mistaken; and the master declared that the lowings of this ox would one day resound throughout the world. With Albert he spent a short time at Paris. After their return to Cologne, in 1248, Albert was commissioned by the Dominican order to establish a theological school, in which Aquinas taught.

In 1253 he again went to Paris, and soon afterward took a leading part in the defense before the pope of the mendicant orders against the assaults of the university of Paris. During his visit to Paris he became the friend of the Franciscan Bonaventura, whose character, so unlike that of Aquinas, was indicated by his title of "doctor seraphicus." When he sought the doctor's degree at Paris, the university resolved not to admit him; but so great was his renown that they were compelled to rescind the resolution, and in 1257 he received his doctor of theology. Thoroughly imbued with the scholastic, dialectic, and Aristotelian philosophy, he came forward, after a few years, as a public teacher in Paris.

His masterly application of this philosophy to the systematizing of theology gave him the first place as a philosophical and theological authority. His fame as a theologian became supreme throughout Europe, and the popes acknowledged him as the greatest theologian of his age. Louis IX. of France (St. Louis) admitted Aquinas to intimate friendship, and he was a frequent guest at the court of that ruler. Numerous stories are told in connection with the intensity with which he pursued his theological and philosophical inquiries. On one occasion, it is related, when dining at the table of Saint Louis, his absorption was so complete that he struck the board violently, with the exclamation, "This is conclusive against the Manichæans!" The king, no way disconcerted, simply ordered his secretary to take the argument down, and the repast was then resumed.

In 1261 Pope Urban IV., upon his ascension to the pontificate, called him to Rome, to assist in the difficult task of reconciling the Greek and Latin churches. The succeeding pope offered him the archbishopric of Naples; but this he declined, as he did other promotions and dignities. He was content to remain a simple monk, free to devote himself to the arduous task he had chosen. In 1269 he was once more at Paris; but was called again to teach at Naples in 1272. Pope Gregory X., having convoked a general council at Lyons, France, in 1274, the object of which was to formally settle the union of the Greek and Latin churches, Aquinas was summoned to assist. He set out for Lyons before the end of winter, and on his way visited the castle of Magenza, the seat of some of his kinsfolk. Here he was suddenly seized with a fever, and by his own desire was removed to the convent of Fossa Nuova, where he died, still in the prime of life, March 7, 1274. According to a report that was given wide currency — and accepted, apparently, by Dante — he was poisoned at the instigation of Charles I. of Sicily, who dreaded the evidence that Aquinas was able to give of him at the council of Lyons.

The possession of his remains was as eagerly coveted as his living presence and teaching had been. For nearly a century the dispute for his dead body was maintained between the monks of the convent of Fossa Nuova, the order to which he belonged, and the university of Paris. It was at last settled in favor of the Dominican order, and the body was removed, in 1369, to Toulouse, where a splendid monument was erected to his memory. He had before this, in 1323, been canonized by Pope John XXII. The further honor was reserved for him of being named, two centuries later, by Pius V., the fifth doctor of the church.

Aquinas was remarkable for modesty, exemplary obedience, and purity of life. Neither can we withhold our admiration of his lofty aim, unselfish toil, grand patience, and the wholesome influence he exerted in the world. He was a man of distinctly philosophical temper, gifted with great mental powers. His intellect was acute, clear, logical, passionless. He looked at every subject through the understanding, and reduced it with minute precision and accuracy to the syllogistic form. He had great perspicacity of thought and perspicuity of expression, and carried the penetration of his intellect into all theological subjects with the boldest and calmest confidence. His definitions and distinctions are minute as well as numerous, often impalpable to the common intellect. Aquinas may be said to have carried the Aristotelian logic, as applied to theology, to its utmost limit. In him the scholastic system of theology reached its highest point.

To appreciate the work of Aquinas and the schoolmen, we must realize the intellectual shock given to the western mind by the spread of the Mohammedan faith, and by the revival of Greek learning under Mohammedan auspices. Monotheism, stripped of the mysteries of the Catholic faith, had spread over eastern Europe and Spain, and, by absorbing and propagating Greek thought, was asserting intellectual supremacy. The solvent effects of contact between East and West had already shown themselves in the heresies with which southern France teemed, and which had roused the fervor of Dominic. Against this formidable invasion the schoolmen, headed by Aquinas, instituted a spiritual crusade.

Aquinas saw and felt the chronic enigmas of human existence. He faced them with astonishing boldness. The aim and hope of his life was to serve the world and the church by solving them. To this high task he early set himself with unselfish courage and devotion; by a lifetime of immensely laborious study he accumulated all the learning of his own age, and thus equipped himself for the accomplishment of his grand design. It was nothing less than this: to effect a harmony of reason and revelation. His assumptions were that both were of divine origin and authority, and that no truth uttered by the one could contradict any truth uttered by the other. Disgusted with the obscurity and confusion which prevailed in the theologies of the age, he sought to introduce an orderly, consistent, and all-comprehensive system; and in his effort to accomplish this purpose he invoked all the subtleties and power of Aristotle's logic.

He first published several works which served as preliminaries to his greatest work. Among these were a commentary on the so-called *Sententiæ*, or "Sentences," of Lombardus; and the *Summa Catholicæ Fidei contra Gentiles*, or "Defense of the Catholic faith." In the latter — the ablest of his philosophical writings — he throws new light over the most abstract truths, and the principles of the church are defended against its enemies both within and without. The circumstance of his being a Dominican, and boasted of by his order as their great ornament, excited the jealousy of the Franciscans against him. In the beginning of the fourteenth century, Duns Scotus, a Franciscan, came forward as the declared opponent of the doctrines of Aquinas, and founded the philosophico-theological school of the Scotists, to whom the Thomists, mostly Dominicans, stood opposed. The Thomists leaned in philosophy to nominalism, although they held the abstract form to be the essence of things; the Scotists, on the other hand, inclined to realism; and out of this rivalry sprang up the famous controversy over nominalism and realism that characterized the philosophical discussions of the middle ages for several centuries.

One great service which Aquinas rendered to philosophy was that of encouraging and obtaining a complete translation of the works of Aristotle directly from the Greek. Until then only portions of them had been known, and those very imperfectly by Latin translations from the Arabic.

After ten years of labor Aquinas expanded his earlier work — *Contra Gentiles* — into his great work, the *Summa Theologiæ*, or "Sum of Theology," which remains to this day the most comprehensive and complete of all expositions of the Catholic system.

The work has three divisions, broadly corresponding to the subjects God, man, the church. The existence of God is demonstrated, on Aristotelian principles, as the final source of motion, itself unmoved. But how pass from the Aristotelian to the Christian God? To demonstrate the Trinity was infinitely beyond human power. Nevertheless, even here reason must not abdicate. In human nature rightly fathomed was to be seen something that rendered the mysteries of the faith not indeed intelligible but conceivable. Those things, Aquinas explains, that are said of God are to be interpreted by analogies drawn from the highest of created things. Whoever understands is aware that in the act of understanding there issues somewhat from his mental power and knowledge, which is the concept of the thing understood. This is the word — first unspoken, then spoken. So, too, in the operation of will there is within us something else that proceeds, a proceeding of love, by which the loved object is said to dwell within the lover.

But disquisitions on the nature of being and the existence of God, though the foundation of the Catholic system, yet occupy but a small portion of it. Even of this first division of the work, a large part is occupied with the attempt to reconcile the accepted conclusions of physical science with the Mosaic account of the creation, and with the relations of mind and matter, as illustrated in the contrast of human nature with the bodiless intellects called angels — a discussion fertile in after consequences. Under the guidance of his master, Albert the Great, Aquinas had thoroughly assimilated the physical science of his time. He had begun his career by voluminous commentaries on the physical and metaphysical works of Aristotle. Enough was known of the solar system and of natural history to render the acceptance of the Hebrew story of creation very difficult. Why was light created on the first day, and the stars on the fourth? Why was the moon called one of the two great lights, being smaller than any of the planets? Why were birds and reptiles said to issue from the water, quadrupeds from the land? These and countless other objections are fully set forward. The task of reconciling science and scripture, familiar to our own times, then begins, the result being that a far wider pathway was opened for scientific research than is commonly supposed.

The second and most important division of the work deals with the moral government of man. It has two parts, the first discussing the more general aspects of human conduct, the second the more special. In the first the principal subjects considered are free will; human passions; virtue and vice; sin, original, venial, and moral; law, natural, Judaic, Christian; and grace. In the second subdivision each virtue is considered with its opposing vice; first, the theological virtues of faith, hope, and charity; second, the cardinal virtues, prudence, justice, fortitude, and temperance. Throughout this part of the work the *Ethics* of Aristotle is far more frequently quoted than the scriptures or the fathers. It may be noted that in the discussion of justice Aquinas was considered by the great Grotius to have laid a sound foundation for the theory of international law.

The third part deals with the incarnation, the sacraments, and the state of the soul after death. Of this part the first ninety chapters only are believed to be by Aquinas. It is known at any rate, that on December 6, 1273, he was writing at Naples the ninetieth chapter when weakness of health compelled him to break off his studies. It may be remarked that the doctrine of papal infallibility, as the result of ultimate appeal in question of disputed doctrine, is systematically maintained. Aquinas could not conceive of a society like the church existing without government.

The only scholastic theologian who in any degree rivaled St. Thomas in his own age was the so-called "subtle doctor," Duns Scotus, of the order of St. Francis. The Franciscans naturally followed Scotus, and the Dominicans founded their teachings on St. Thomas; henceforward mediæval theology was divided into two schools — Scotists and Thomists. The divergencies which penetrate almost every branch of doctrine depend upon the different systems of metaphysics or scholastic philosophy upon which the theologies were based. These differences concerned principally the idea of God, the operations of grace and justification, the mode in which the sacraments take effect, etc. Popularly, Scotism is best known for its advocacy of the immaculate conception, and for its doctrine of the incarnation. Thomism represents, on the other hand, with few exceptions, the general teaching of the Catholic church to-day — the sources of truth through revelation and reason, the doctrine of God, the visible church, the virtues, and other cardinal doctrines set out in his writings.

It is stated that on the assembling of the council of Trent, essentially a council against Lutheranism, the advances of which had rendered it necessary to reconstruct the dogmatic fortifications of the church, there was laid on the desk of the secretary of the council, beside the Bible, a ponderous folio of the *Summa Theologiæ*, the masterpiece of St. Thomas Aquinas, produced about three centuries earlier. It had long won acceptance and reverence as the highest authority in theology and philosophy, and was held to contain the final solution of all the problems which were to be discussed at the council. The incident is significant, not only of the extraordinary authority of the book at that time, but also of the character which modern Catholicism was to take from it.

"In his works," says Milman, "or rather in his one great work, is the final result of all which has been decided by pope or council, taught by the fathers, accepted by tradition, argued by the schools, inculcated in the confessional. The 'Sum of Theology' is the authentic, authoritative, acknowledged code of Latin Christianity."

The commentaries of St. Thomas Aquinas on scripture and his devotional treatises also have a high reputation. His influence on the theological thought of the world from his own time down to the present has been immense. He united theology with ethics, and laid broad and deep the foundations of Christian morals — one of his distinct achievements. In 1879 his philosophy and theology were declared, on papal authority, the basic teachings on those subjects, throughout the Catholic world; and, in 1883, his complete works were published under the auspices of Pope Leo XIII., in Latin, the language of their original composition. Important parts of all his works, as well as summaries, have also been published in English.

In recognition of his talents and virtues, St. Thomas has been variously styled the "universal doctor," "angelical doctor," "prince of scholastics," "doctor of the church," and "patron of all Catholic schools."

BACON

A. D.		AGE
1561	Born at London,	..
1573	Entered Trinity college, Cambridge,	12
1576	Visited France,	15
1582	Admitted to the bar,	21
1597	*Essays,*	36
1603	Knighted by James I.,	42
1605	*Advancement of Learning,*	44
1609	*Wisdom of the Ancients,*	48
1613	Attorney-general of Great Britain,	52
1617	Lord keeper of the great seal,	56
1618	Lord chancellor, and Baron Verulam,	57
1620	*Novum Organum,*	59
1621	Charged with corruption,	60
1622	*History of Henry VII.,*	61
1626	Died at Highgate,	65

FRANCIS BACON, commonly, but incorrectly, called Lord Bacon, was one of the most illustrious of English philosophers, as well as an eminent jurist and statesman. He came of distinguished parentage, being the second son of Sir Nicholas Bacon, lord keeper of the great seal, under Queen Elizabeth, and Anne, daughter of Sir Anthony Cook, the preceptor of Edward VI. The place of his birth was York House, in the Strand, London, where he was born January 22, 1561.

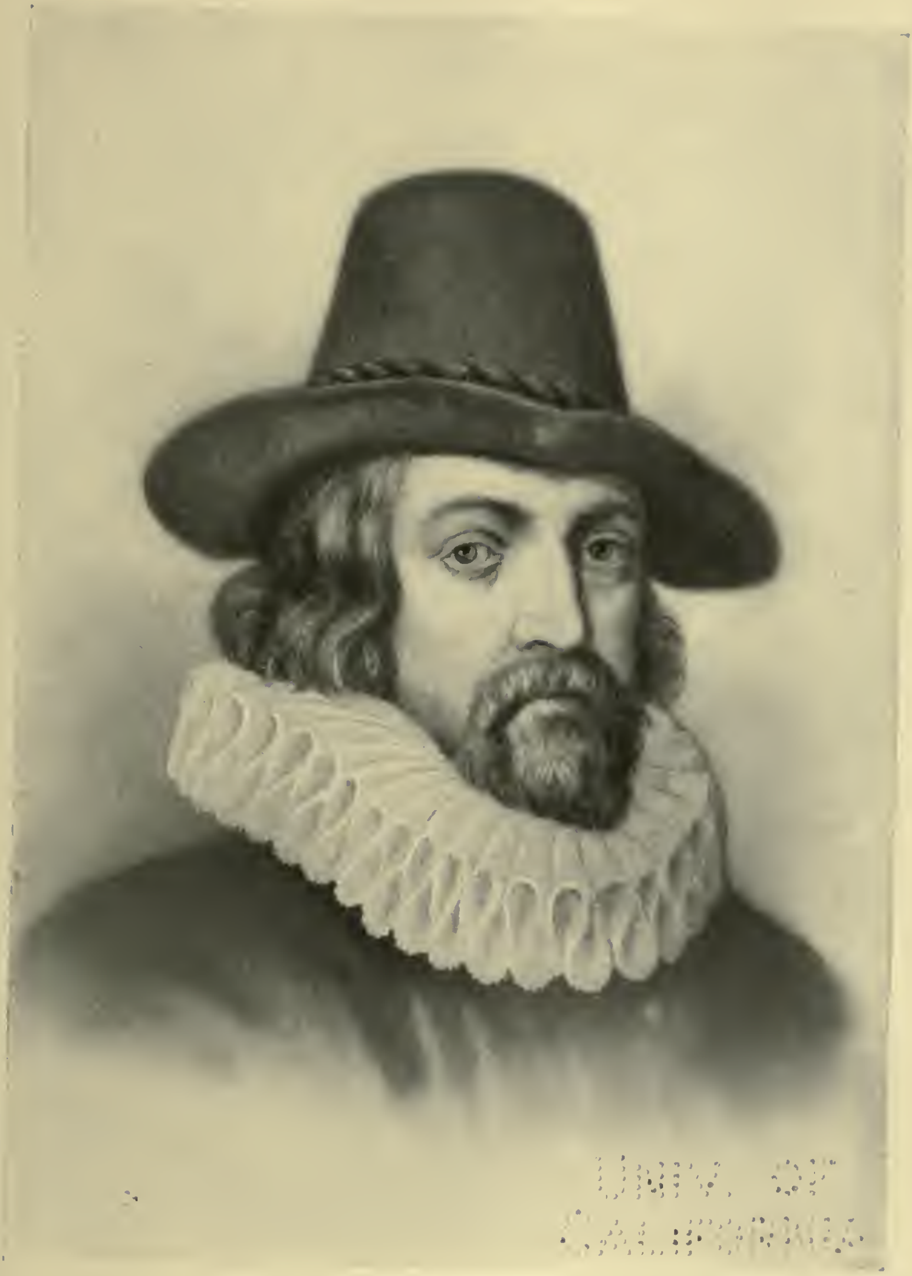
In childhood Bacon was remarkable for physical delicacy and mental precocity. He had a lively wit, and his sedateness was so marked that the queen took pleasure in calling him her "young lord keeper." At the age of twelve he was sent to Trinity college, Cambridge, where he remained in residence for three years, and quitted it with a strong conviction against the fruitfulness of the system of philosophy there taught, and the consequent necessity of educational reform. He revolted especially against the philosophy of Aristotle, which he considered "a philosophy only for disputations and contentions, and barren in the production of works for the benefit of the life of man"; and his intellectual efforts were ever after bent on working out and declaring the philosophical views for which he is chiefly famous.

In 1576 he was entered as a student in the society of Gray's Inn, with the view to preparing for the bar. Before, however, he commenced his legal studies, his father sent him to France, in the suite of the British ambassador, Sir Amyas Paulet. During his residence abroad he wrote his first work, which was not intended originally for publication, but was improved and printed after some years. It was called *Of the State of Europe*, and derives its chief interest from its having been written at the early age of nineteen. The civil and political views, however, of even this very early production, are sound, and the composition graceful.

In 1579 Sir Nicholas Bacon died, leaving Francis but a small share of his fortune. Finding his private means insufficient for his support, he returned to England and commenced the study of law, to which he applied himself with great diligence. He did not, however, suffer the demands of his legal studies to interfere with those pursuits, in which he was fully persuaded that his great strength lay. Between the ages of twenty and twenty-eight he produced a work, which he called the *Greatest Birth of Time.* It was never published, and is lost in its separate form, but the substance of it remains in his *Instauratio*.

In 1582 Bacon was admitted to the bar, and in 1588 was chosen reader, or lecturer, by the society of which he was a member. In the same year he received the only mark of honor conferred upon him in the reign of Elizabeth, in the title of "counsel learned in the law extraordinary." It is worthy of notice that Bacon, who was the nephew of the lord high treasurer Burleigh, and cousin of the secretary of state, Sir Robert Cecil, was never able to obtain any office in the court of Elizabeth. The reason evidently was that he had early attached himself to the faction of the earl of Essex, who, though the queen's greatest favorite, was in constant opposition to her ministers. This unfortunate nobleman exerted himself to the utmost, at the extreme risk of offending his testy mistress, to secure for Bacon the place of solicitor-general, as the first step of legal advancement; but he was unsuccessful. The ministers declared their belief that Bacon was merely a theorist, and that his talents were not fitted for practical purposes. Perhaps there was no small mixture of jealousy in this declaration. To make some amends to Bacon for this disappointment, Lord Essex gave him an estate out of his own private fortune, which he afterward sold at a ridiculously low price. This was one of many kindnesses which Bacon illy requited in after years.

In 1592 Bacon published a defense of the government, in answer to a libel, in consequence of which he received the reversion of



UNIV. OF

FRANCIS BACON
From a painting

the register's office to the star chamber, which he did not enjoy until twenty years later. In the parliament of 1593 he was chosen a member for the county of Middlesex, a proof that his public talents were not unappreciated by his countrymen. In parliament he proved himself an orator of the first class; his speeches were extremely elegant and forcible, and his wit so well blended with good sense and winning manners as to secure him the favorable attention of that assembly. He was frequently employed by the government to defend their measures in parliament, which he did with consummate prudence, but he still went publicly unrewarded.

In 1596 Bacon wrote but did not then publish his *Maxims of the Law;* and in the year following he published his first edition of *Essays*, or *Counsels Civil and Moral* — the work by which he is best known to the general reader. In the trial of the earl of Essex for high treason, a few years later, Bacon appeared as counsel for the crown; and, after the execution of that unfortunate nobleman, the queen directed him to compose and publish an account of the earl of Essex's treasons. His apparent zeal on this occasion excited the indignation of the people, among whom Essex was much beloved, and he was obliged to apologize for his conduct by a letter to the earl of Devonshire, one of the firm partisans of Essex.

The death of Elizabeth, which soon followed that of her favorite, revived Bacon's hopes of advancement. He applied himself early to obtain the favor of the new king, James I., and a proclamation, which he drew up on the latter's arrival, though never published, did him great service. He was introduced to the king at Whitehall, and was knighted, July 23, 1603. In the following year his services to the court, in parliament and elsewhere, were rewarded by the title of king's counsel, with a stipend of forty pounds, and an additional pension of sixty pounds.

Although he seemed on the high road of preferment, Bacon had powerful enemies to obstruct his advancement. Sir Robert Cecil, son of Lord Burleigh, created earl of Salisbury by James I., though Bacon's cousin, had always shown himself adverse to his kinsman's advancement, apparently from jealousy of his uncommon talents. Between Bacon and the attorney-general, Sir Edward Coke, there existed a more violent hostility, arising from various causes. Sir Edward was successful early, Bacon late; and the power which Coke obtained he used to depress his antagonist. They had both been suitors of the rich Lady Hatton, Lord Burleigh's granddaughter, whom Coke married. As a further exasperation of their enmity, a celebrated legal dispute occurred in 1616, between the courts of king's bench and chancery, "Whether the chancery, after judgment given in the courts of law, was prohibited from giving relief upon matters arising in equity, which the judges at law could not determine or relieve." Bacon had a leading share in obtaining that decision in favor of the privileges of the court of chancery, which has had so great an influence upon the jurisdiction of courts.

In 1605 Bacon published the first part of *Advancement of Learning*, subsequently expanded into *De Augmentis Scientiarum*, or "Advancement of Science," which inaugurated a new era in English literature and science. His view of the service he was doing is shown in a letter to Lord Salisbury, sent with a copy of this work, where he says that in this book he was contented to awake better spirits, being himself like a bell ringer, who is the first to call others to church.

The year following this notable work he married Alice, the daughter of Benedict Barnham, a wealthy London merchant and alderman, who outlived him many years, and by whom he had no children.

In the year 1607 Bacon achieved his first substantial success in public affairs. Lord Salisbury had arisen to such power and confidence with the king that he no longer feared the talents of Bacon, and with his concurrence, if not by his means, Bacon was at length appointed solicitor-general of the kingdom, which, besides its future promise, was an office worth five or six thousand pounds a year to him in private practice. Though now a busy man, and constantly engaged in affairs of the crown, he nevertheless found time to write and publish, in 1609, his *Wisdom of the Ancients*, a work of great elegance and profound learning. In 1611 he was appointed joint judge of the knights marshals' court, and, in 1613, attorney-general, on the promotion of Lord Coke to the office of chief justice of the king's bench. Bacon did not attach himself to the fortunes of the reigning favorite, the earl of Somerset, and when that lord and his countess were brought to trial for the murder of Sir Thomas Overbury, he had the management of the case for the crown, which he so conducted as to keep himself out of the disgrace into which Coke and others fell with the king, on account of this critical affair.

He was further advanced to the office of lord keeper of the great seal in March, 1617, on the resignation of the lord chancellor, Viscount Brackley, and the same year sat at the head of the council board as manager of the king's affairs, during the absence of the monarch and his new favorite, Buckingham, in Scotland. On the return of the king, Bacon was made lord high chancellor, January 4, 1618, and in July following he was created Baron Verulam. In 1620 he sent to the king his *Novum Organum*, or "New Instrument of Logic, better calculated for the real progress of science than that of Aristotle."

The next year Bacon received the title of Viscount St. Albans, and opened parliament of February, 1621, the most honored and among the most powerful subjects of the realm. But this parliament was fatal to him. James I. had not called this assembly together for more than ten years, except for the short session of two months in 1614, and during that period had been subsisting on the unconstitutional resources of benevolences, and the sale of monopolies. Almost the first act of this parliament was the inquiry into abuses, more particularly those of the courts of justice, and the sale of patents.

As all patents had to pass the seal, it was natural that the conduct of the lord keeper should be looked into, and this led to further inquiry concerning the administration of justice in the chancellor's court. The chairman of a committee appointed to conduct this inquiry brought up two charges of bribery against Bacon. This alarmed James and his favorite, and parliament was adjourned for three weeks in the hope that the affair would blow over. But during this recess twenty-two cases of bribery were charged upon the chancellor, and a deputation from the house of commons waited on him to know whether he would confess or refute them. In a few days he chose to make confession, and threw himself on the mercy of his peers.

Bacon's confession was not thought ample enough, and too extenuatory. He was then obliged to make one still more full, in writing, upon which a deputation of thirteen lords was sent to him, to know whether it were really his. His answer to them was, "My Lords, it is my act, my hand, my heart; I beseech your lordships to be merciful to a broken reed." At the petition of the peers, the seals were sequestered, Bacon was deprived of his speakership and of his seat in parliament, and further was fined forty thousand pounds, sentenced to imprisonment during the king's pleasure, debarred from entering the court, and declared incapable of holding any office in the future.

This penalty was considerably mitigated by James, who confined him but a short time in the Tower, allowed him to make over the fine to assignees of his own choosing, and, for the settling of his affairs, gave him leave to reside for some time within the verge of the court. After some years, at the earnest solicitation of Bacon, "that his royal master would be pleased to wipe out his disgrace from the page of history by his princely pardon," he received the favor he so much desired. At the age of sixty-one he retired to his country seat at Gorhambury, having an income of about twenty-five hundred pounds. His debts amounted to about thirty thousand pounds, of which he liquidated a third before his death.

Here — at Gorhambury — apart from the noise and stir of life, Bacon more sedulously bent his mind to the cultivation of philosophy, his true field of labor. With the exception of his *History of Henry VII.*, in 1622, and a tract written against the match between Prince Charles and the infanta of Spain, the last years of his life were spent in making philosophical experiments, and in moulding his works to a more perfect form. It was his great wish that what he had written should be translated into the general language of learning, Latin. Consequently, much of his time during this period was employed in expanding and translating the *Advancement*, or revising the translations of his friends.

In March, 1626, he caught cold while stuffing a fowl with snow near Highgate, in order to observe the effect of cold on the preservation of flesh. He was taken to the house of Lord Arundel, in Highgate, on his way to London, and a week's acute illness carried him to his grave, April 9, 1626. He was buried in St. Michael's church, St. Albans. For a long time no stone told where he lay, until the affection of an old servant erected a marble monument to the memory of his noble master.

Bacon's personal appearance was prepossessing. He was of medium stature, well formed, but not robust. His head was well poised, with a high, broad forehead, and his face was expressive of benevolence and high intellectual culture. "In advanced life," says Lord Campbell, "his whole appearance was venerably pleasing, so that a stranger was insensibly drawn to love before knowing how much reason there was to admire him. He was a most delightful companion, adapting himself to company of every degree, calling, and humor, and bringing out with great effect his unexhausted stores of jests new and old." He was singularly free from all jealousy, delighted to recognize merit in others, and was uniformly kind to his servants and dependents. His glaring weaknesses were founded on his extravagance and inordinate love of display. These, together with his supreme belief in himself, led him to ignore many of the ordinary laws of morality, and finally culminated in his social disgrace and ruin. He seemed peculiarly deficient, too, in gratitude, was continually in pecuniary difficulties, and was even arrested for debt on several occasions. Whether the classic characterization of him as the "wisest, brightest, and meanest of mankind" was altogether just and accurate will ever be a matter of divided opinion; but that he was eminently human both in his faults and his virtues, all will agree.

At the time of his death, Bacon's name was widely known throughout Europe, and he himself was appreciated on the continent to a far greater extent than by his fellow countrymen. Some allusion to this is found in his will, in which, after having commended his soul to God, and his body to dust, he proceeds, prophetically, to "bequeath his name and fame to foreign nations, and to his own countrymen after some time be passed over."

Bacon's literary work is divisible into philosophical, purely literary, and professional writings. His philosophy is chiefly to be studied in (1) *Advancement of Learning*, a review of the state of knowledge in his own time, and its chief defects; (2) *De Augmentis Scientiarum*, a Latin expansion of the *Advancement;* and (3) *Novum Organum*, intended to form the second book of a never-completed greater treatise, *Instauratio Magna*, a review and encyclopedia of all knowledge.

The *Novum Organum* is his chief work, and may be regarded as the one supreme thought of his life. He not only commenced it twelve different times, but after it had been first completed he was almost ceaseless in retouching it. In this work, as indicated by the title, Bacon proposes to substitute for the *Organum* of Aristotle, the scholastic logic, the syllogism and abstract principles generally, a new *Organum*, a logic of experience and induction. This new logic was only presented as the instrument of a vast reform, which he himself sets out as follows:

"Man, being the servant and interpreter of nature, can do and understand so much and so much only as he has observed in fact or in thought of the course of nature; beyond this he neither knows anything nor can do anything.

"Neither the naked hand nor the understanding left to itself can effect much. It is by instruments and helps that the work is done, which are as much wanted for the understanding as for the hand. And as the instruments of the hand either give motion or guide it, so the instruments of the mind supply other suggestions for the understanding or cautions.

"Human knowledge and human power meet in one; for where the cause is not known the effect cannot be produced. Nature to be commanded must be obeyed; and that which in contemplation is as the cause is in operation as the rule.

"The conclusions of human reason as ordinarily applied in matter of nature, I call for the sake of distinction *Anticipations of Nature* (as a thing rash or premature). That reason which is elicited from facts by a just and methodical process I call *Interpretation of Nature.*

"I am of the opinion that if men had ready at hand a just history of nature and experience, and labored diligently thereon; and if they could bind themselves to two rules — the first to lay aside received opinions and notions; and the second, to regain the mind for a time from the highest generalizations, and those next to them — they would be able by the native and genuine force of the mind, without any other art, to fall into my form of interpretation. For interpretation is the true and natural work of the mind when freed from impediments. It is true, however, that by my precepts everything will be in more readiness, and much more sure.

"Nor again do I mean to say that no improvement can be made upon these. On the contrary, I that regard the mind not only in its own faculties, but in its connection with things, must needs hold that the art of discovery may advance as discoveries advance."

The purpose of it all was to be the great philosophy of the future — active science. The conflict between science and metaphysics had already begun through the astronomical discoveries of the sixteenth century. Bacon conceived the next step to be the scientific observations of nature, and the construction of a doctrine applicable to the conduct of human life, so that the richness of its results might be contrasted with the sterility of metaphysics. He found that the beliefs of learned men — apart from religious beliefs — rested upon the authority of one unquestionably great intelligence, Aristotle, who had invented laws of science, unfounded except in the speculations of his own mind, and many of them misunderstood by his idolizers. These laws were given or made, and facts were supposed to follow from them necessarily and without question. But Bacon proposed to found his general laws on actual experiments. So that, when a multitude of conclusions were adduced from this course of proceeding, and laws should be formulated which fairly accounted for certain phenomena, the application of such laws might further become the confirmation of fresh, and, it may be, more difficult combinations.

The *Novum Organum* begins by eliminating four sources of error, called by Bacon idols. (1) The errors due to the inherent weakness of man's understanding, its incapacity for resisting sensuous impressions or impulses of passion; its readiness to suppose far more simplicity in surrounding nature than really exists; its want of patience and sobriety. These things he called idols of the tribe. (2) The errors originating in the peculiar constitution and temper of each individual. These he called idols of the den. (3) The errors springing from inaccurate use of language — the idols of the market. (4) The errors brought about by the prejudice of philosophic systems—the idols of the theater.

The second part of the *Organum* deals with the interpretation of nature. The object is to detect what Bacon calls forms, corresponding very nearly to what we know as laws of nature, i. e., uniform actions exhibited in widely different objects. "A nature being given," he says, "we must first present to the understanding all the known instances which agree in the same nature, though the subject-matter be considerably diversified." These must be contrasted with instances which do not admit of the given nature. Most important of all are what he terms prerogative instances, of which he defines twenty-seven classes. Among them may be noted, solitary instances, those showing the same quality in bodies otherwise different, or some difference in bodies otherwise identical; migratory instances, the gradual transition from a given state to its opposite; singular instances, objects apparently exceptional, and standing alone in nature; instances of power, i. e., the study of the principles underlying man's practical arts; instances of the road, the study of the gradual and continuous motions of nature, as in the germination and growth of seeds, the incubation of eggs; finally, instances of the cross, otherwise called decisive, or judicial — the metaphor being borrowed from the crosses erected where two roads meet: when two explanations of a fact are equally possible, find a fact that can only be explained by one of them.

This will illustrate sufficiently the method of the *Organum*. He did not propose to make discoveries but simply cause them to be made; yet he himself anticipated several. For instance, he invented a thermometer; he instituted ingenious experiments on the compressibility of bodies, and on the density and weight of air; he suggested chemical processes; he suspected the law of universal attraction; he foresaw the true explication of the tides, and the cause of colors.

Here are a few of his prophecies as appended to the *New Atlantis:* The prolongation of life, the restitution of youth in some degree, the retardation of age, the curing of diseases counted incurable, the mitigation of pain, more easy and less loathsome purgings, the increasing of strength and activity, the increasing of ability to suffer torture or pain, the altering of complexions, and fatness, and leanness, the altering of statures, the altering of features, the increasing and exalting of the intellectual parts, conversions of bodies into other bodies, making of new species, transplanting of one species into another, instruments of destruction, as of war and poison; exhilaration of spirits and change of temperament; force of the imagination, either upon another body, or upon the body itself; acceleration of time in maturations, acceleration of time in clarifactions, acceleration of putrefaction, acceleration of decoction, acceleration of germination, making rich composts for the earth, impressions of the air, and raising of tempests; great alteration, as in induration, emollition, etc.; turning crude and watery substances into oily and unctuous substances not now in use, making new threads for apparel, and new stuffs, such as paper, glass, etc.; natural divinations, deceptions of the senses, greater pleasures of the senses, artificial minerals and cements.

While soaring on sublime heights we must not forget that the chief end of all speculation is practice, the philosophical is only a means to the practical; all science has prevision for its object. Bacon's greatness, therefore, consists in his insistence on the facts that man is the servant and interpreter of nature, that truth is not derived from authority, and that knowledge is the fruit of experience; and in spite of the defects of his method, the impetus he gave to future scientific investigation is indisputable. He was the practical creator of scientific induction.

"Bacon," says Bishop Creighton, "first clearly set forth the claims of inductive philosophy as against the old methods of metaphysical speculation. He asserted that knowledge was to be found by careful investigation of nature, not by spinning cobwebs of the brain. He turned men from disputations of words to an observation of the world around them. Bacon's method was faulty, as was natural for a beginner; but modern science has still to point to him as the man who first brought into due prominence the principles on which its method was to be founded."

DESCARTES

1644	*Principia Philosophiæ*, or "Principles of Philosophy"; visited France, ...	48
1649	At court of Sweden, ...	53
1650	Died at Stockholm, Sweden, . .	54

RENÉ DU PERROT DESCARTES, distinguished French philosopher, and founder of modern philosophy, was born at La Haye, near Tours, France, March 31, 1596. His father held hereditary membership in the provincial government of Touraine, and belonged to one of the best families of that province. At his death, Descartes inherited a modest competency, which enabled him, in after life, to follow the philosophic bent of his mind without difficulty or distraction.

When about eight years of age, Descartes was sent to the Jesuit college at La Flèche, where he remained, in all, about eight years. During this period of his life he appears to have devoted himself mainly to poetry and mathematics, particularly the latter. He was also conducted by the professors through the regular course of physics and philosophy; but even at that early age he became deeply impressed with the uncertainty of the premises they laid down, and the conclusions they drew from them, and felt then the first rising desire to see a totally new reconstruction of all the sciences. Influenced by these doubts which pressed upon him, he returned home and gave up all literary pursuits.

His father, some time after, sent him to Paris, to broaden his knowledge of the world and acquire the general culture which was considered necessary to a youth of noble origin. Here he was won over for a time to the illicit pleasures and dissipations of the capital; but the silent reproaches of his best friend, Father Mersenne, brought him back, before it was too late, to his original love both of study and virtue. He hid himself away, therefore, in some corner of the metropolis, concealed from all his associates, and there devoted his whole time, for more than two years, to mathematical and other philosophical pursuits. When he emerged from his solitude, he yielded to the solicitations of his friends and family to take up the military profession. Perhaps he also thought that the great problems of human life might appear to him in a new and clearer light, if he withdrew himself temporarily from all theorizing, and entered into more practical and active pursuits. What philosophy failed to teach him, he hoped to acquire in the way of personal experience.

For this purpose he betook himself to Holland in 1617, where he served under Prince Maurice as a volunteer; but, as there were no active operations at hand, he gave up his commission, and entered the Bavarian service. We find him soon after taking part in the thirty years' war, where he witnessed the struggle of arms in Bohemia and Hungary, and bore himself with courage and credit. In 1621, after more than four years' experience of military life, he renounced the profession, and returned home to France. He appears to have taken no interest whatever in the political quarrels of the age, and to have used his experience in war merely to study human passions; to observe the application of mechanical principles to practical uses; and to extend his knowledge of mathematical and physical science generally.

He now came into possession of a comfortable income inherited from his mother, and, for a short period, lived in serene meditation at home. In 1624-25 he made excursions into Switzerland and Italy, and acquired a steadily increasing fame as a mathematician and a philosopher. The fame which he thus gained was little to his taste; and the perpetual disturbance to which he was subject at Paris, as it increased more and more widely, induced him to return to Holland, where he spent nearly all of the remainder of his life. His motive for taking this step was evidently not merely the desire of philosophic repose, but also the consideration that he might, in the course of his future career, find a land of universal toleration, a condition as necessary to his peace as it was agreeable to his temperament.

In 1629, therefore, when in his thirty-third year, he took up his abode in Amsterdam, and in this retreat he composed all his principal works. He communicated with the great world without only through the intermediate agency of his old and faithful friend, Mersenne. His "Discourse on Method" he gave to the world in 1637; his "Speculations on Fundamental Philosophy," in 1641; his "Principles of Philosophy," in 1644. In Holland, Descartes lived and studied for twenty years, devoting himself to optics, meteorology, anatomy, chemistry, and mechanics, as well as to the reform of philosophy itself. He attracted many disciples, and at the same time became involved in several learned controversies, especially with the theologians.

In 1649 he yielded to the pressing invitation of Queen Christina of Sweden, to remove to the court of Stockholm, and become her private tutor. His willingness to leave Holland was partly occasioned by his anxiety to escape from the hostility of his enemies. The breaking up of his old habits, combined with the severity of the climate, however, threw him soon upon a bed of sickness, and, in 1650, he died in the fifty-fourth year of his age. He never married. In 1666 Louis XIV. caused his remains to be carried to France and entombed in the church of St. Geneviève du Mont. In 1819 they were transferred to the church of St. Germain-des-Près, their final resting place.

Descartes fell on one of those recurring periods of intellectual depression when philosophy is in decrepitude, representing little knowledge, liberty, or wisdom, and he regenerated it. We can speak but briefly of what he did or what he was. In an epoch of dogma and intolerance, an original thinker appears, as if inevitably, to strike always into the same course. Turning from the disorder of the received physical sciences, Lord Bacon prepared for his *Instauratio* by research concerning true method in physical inquiry. Descartes, repelled by corresponding disgust from the moral and psychological discussions of his time, demanded: What is fitting method in speculative philosophy; and what the basis and criterion of certainty? The reply was not a new one, but only a reproduction of the method of Socrates, of Plato, or Aristotle, and its adjustment to the condition and culture of his time.

The first and shortest yet most important work of Descartes is his "Discourse on Method." This work may be considered the foundation of modern philosophical investigation, and breathes the spirit of the man with his bold innovating genius, his exact observations, and vivid imagination. It was the custom in Descartes's time to publish all learned works in Latin, a language known only to learned men. He revolutionized this custom by publishing his works in French, "appealing to the good sense of men," which he said was "fairly divided among all classes." It contains a history of the inner life of the author, tracing the progress of his mental development from its commencement in early years to the point where it resulted in his resolution to hold nothing to be true until he had ascertained the grounds of certitude.

The "Discourse" is divided into six parts, with a preface of fifteen lines, describing its purpose and arrangement. He begins by insisting upon the necessity of a new method, and then lays down the rules on which it should be founded. He declared he could find nothing but doubt and uncertainty in the opinions of men on all subjects. He repeats what the sceptic philosopher had already said about the general reasons for suspecting all our so-called knowledge. Our senses, memory, and even the reasoning faculties deceive us, not merely in complex subjects, but even in the simple details of geometry. There seemed only one way to overcome the difficulty, and that was to make universal doubt the point of departure for a new method of reasoning. He found one, and only one proposition that seemed to him to stand the test, and of which the truth could not possibly be doubted: that proposition was that he existed, which he inferred from the fact of his possessing consciousness. He could not doubt that he felt and thought, and therefore he could not doubt that he, the feeler, the thinker, existed. This relation between consciousness and existence he expressed by the memorable words: "I think, therefore I exist." Instead, however, of making the above proposition the foundation of his philosophy, by which he would have been led into a direction similar to that of Kant or Fichte, he employed it only so far as to ascertain from it the criterion of certitude — viz., that whatever is clearly and distinctly thought, must be true. Among these clear and distinct thoughts he soon recognized the idea of God as the absolutely Perfect Being. This idea, he reasoned, could not be formed in our minds by ourselves, for the imperfect can never originate the perfect; it must be connoted, or be a part of the original structure of our understanding, and be implanted there by the Perfect Being Himself. Hence, from the existence of the idea of perfection, Descartes inferred the existence of God as the originator of it; he inferred it also from the mere nature of the idea, because the idea of perfection involves existence. But if God exist, then we have a guarantee of the previously determined ground of certitude, for God the Perfect Being cannot deceive, and, therefore, whatever our consciousness clearly testifies, may be implicitly believed.

One of the most general fundamental principles of the philosophical system of Descartes is the essential difference of spirit and matter — the thinking and the extended substances — a difference so great, according to Descartes, that they can exert no influence upon each other. Hence, in order to account for the correspondence between the material and the spiritual phenomena, he was obliged to have recourse to a constant coöperation on the part of God. This doctrine gave rise subsequently to the system called occasionalism, the principle of which was that body and mind do not really affect each other, God being always the true cause of the apparent or occasional influence of one on the other. This doctrine received its complete development in the preëstablished harmony of Leibnitz, almost a century later.

Descartes did not confine his attention to mental philosophy, but devoted himself systematically to the explanation of the properties of the bodies composing the material universe. In this department his reforms amounted to a revolution, though many of his explanations of physical phenomena were purely *a priori*, and some of them sufficiently absurd. His principal purpose was to explain the whole visible world, including the physical structure of man, in accordance with fixed laws derived from the simplest facts of form and motion. It was a philosophy of evolution as opposed to creation. To soothe the theologians, who, in his time, were pressing so hard upon Galileo, Descartes was content to say that the operation by which God maintains the world is similar to that by which He created it; so that, if it had pleased Him, instead of creating it instantaneously, to allow these laws of evolution to operate, the result would have been what we now see. He began by assuming space to be occupied by perfectly homogeneous and continuous matter. He then supposed this solid substance to be divided into parcels of various shape and size, each of them animated by motion in various directions. These would observe the laws of motion as Descartes defines them: (1) Each would maintain its own condition of rest or motion or magnitude, until altered by contact with another. (2) In such contact the gain or loss of motion to one body would be exactly compensated by the loss or gain to another — the total quantity of motion in the world remaining invariable. (3) Owing to constant contacts, motion would be usually in curved lines, the moving body tending always to follow the tangent to the curve.

The result after a period of time would be the differentiation of primitive matter into three kinds. The moving portions of matter, by constant attrition, would be for the most part converted into spheroidal molecules of various sizes. Some larger masses of irregular shape would amalgamate into solid masses; the finer particles rubbed off from the molecules would insert themselves between them, vibrating with far more rapid motion than they. This vibrating ethereal substance would collect toward the center of a vortex, and form a sun or star; round it would revolve aërial matter, and plunged amidst this, at various distances, the solid masses of the planets.

How by degrees yet further differentiation took place in the substance of the earth and planets, by different velocities and shapes of the component molecules, so that the various metals and crystals arose, and finally plant life and animal life, cannot be told here, but is described in the *Principia* and in the "Treatise on Man." For man, as far as the structure of his organs, including the organs of sensation, was concerned, was brought within the range of these mechanical conceptions. Descartes was among the first to welcome Harvey's discovery of the circulation of the blood, as the first step toward the reduction of vital phenomena to physical laws.

The achievement of so vast a task was obviously not possible while the science of physics was in its infancy, and while the chemical basis of biology was still undiscovered. Descartes was aware of this. But he looked forward to the combined labors of the future for its fulfillment. The last chapter of his "Discourse" contains his forecast of the positive philosophy of the future, resting not on scholastic subtleties, but on a solid basis of mathematical and biological knowledge, and directed to the practical service of man. What Descartes could not foresee was that, by the time that physics, chemistry, and biology had defined themselves as distinct sciences, the impossibility of reducing them to a single law would be far more evident than it was in his own time.

His celebrated "theory of vortices" gained many adherents, did away with that of Aristotle, and paved the way for Newton's discovery of the law of gravitation, and for the mechanical theory of planetary motions. He described the mathematical principles which should govern the construction of lenses for telescopes; and, among other contributions to physical science, gave the earliest complete description of the causes of a rainbow.

It was in mathematics, however, that Descartes achieved the greatest and most lasting results; and, indeed, his mathematical discoveries procured among his contemporaries, for his, in many cases, wild philosophical views, a greater importance than they in themselves are entitled to. It was Descartes who first recognized the true meaning of the negative roots of equations; and we owe to him the theorem, which is called by his name, that an equation may have as many negative roots as there are continuations of sign, and not more of either kind. He gave a new and ingenious solution of equations of the fourth degree; he first introduced exponents, and thereby laid the foundation for calculating with powers. He showed, moreover, how to draw tangents and normals at every point of a geometrical curve, with the exception of mechanical or transcendental curves; and, what, perhaps, was his highest merit, he showed how to express the nature and the properties of every curve, by an equation between two variable coördinates; thus, in fact, originating analytical geometry, which really may be said to constitute the point of departure of modern mathematics. Measured by its influence, his work in geometry takes rank with the infinitesimal calculus; nor was its empire disputed until in the most recent times by the remarkable theory of quaternions.

The intellectual vigor of Descartes left its marks on many various departments of knowledge after his death. For a while his philosophy threatened to succeed to the place of absolute dictation and mastery which had been so long assigned to Aristotle. His influence passed from the cloister and the study to popular literature; all the great writers of the age of Louis XIV. were tinctured by it; but just as it appeared to have attained a universal acceptance, it began as rapidly to fade and shrink. The reasons of this decline are to be found partly in the growth of Locke's sensational philosophy; partly in the demonstrated impotence of

Descartes's principles to resolve many of the higher problems to which he aspired; but chiefly in the discoveries of Newton and the progress of physics, which discredited his physical theories, and therefore brought his metaphysical conclusions into distrust.

However, even at the present day, when our contemporary philosophy fails, and truth is threatened by scepticism, or dogmatism, the methods and fundamental principles of Descartes are invoked to restore it to a proper basis. In elevation and amplitude his influence, in that respect, ranks with Plato and Aristotle, Bacon and Newton.

SPINOZA

A. D.		AGE
1632	Born at Amsterdam, Holland,	..
1656	Excommunicated by the synagogue; left Amsterdam,	24
1661	Settled at Rhynsburg, near Leyden,	29
1663	"Descartes's Principles of Philosophy,"	31
1664	Removed to Voorburg, near The Hague,	32

1668	Resided at The Hague,	36
1670	*Tractatus Theologico-Politicus*,	38
1673	Declined chair of philosophy at Heidelberg,	41
1674	"Ethics" finished,	42
1677	Died at The Hague,	45

BARUCH SPINOZA was one of the greatest of modern philosophers, and is frequently termed the apostle of pantheism. His name has also been Latinized into BENEDICTUS DE SPINOZA, supposedly because his works were written in that language.

He was born at Amsterdam, Holland, on November 24, 1632. His parents were rich Portuguese Jews, who had been driven from Portugal by the inquisition, and then settled in Amsterdam. From childhood Spinoza was physically delicate, and naturally inclined to retired and studious habits. He received his first education from the rabbis, to whose care he was committed by his parents, and whom he constantly irritated and perplexed with his puzzling questions. He was carefully instructed in the Bible and its commentaries, and the Jewish Talmud; and subsequently devoted himself to a life of study.

At first, Spinoza's parents had strongly hoped that he might enter the rabbinical profession, but his study of the physical sciences and the writings of Descartes very soon drew him away from the rigid belief and practices of the synagogue. His extraordinary talents, coupled with his inquisitive and penetrating turn of mind, at length aroused the displeasure of the talmudical authorities under whom he had studied. Saul Levi Morteira, his principal teacher, was the first to threaten him with the direst punishment if he did not retract the heresies he then began to utter, and a vain attempt was even made to bribe the young sceptic into the required faith and obedience. An attempt was also made later — but again without success — to get rid of him by assassination; but he escaped with a slight wound. His revolt against Hebrew theology finally resulted, in 1656, in his excommunication from the synagogue.

Spinoza, now cut off from the faith of his fathers, was also exiled from Amsterdam by the magistrates on application of the rabbis. A forlorn outcast and an alien, without a home and without citizenship, he attached himself to a learned physician by the name of Francis Van den Ende, who kept a school in Amsterdam for the better class of young Dutchmen. In this school, which was afterward broken up through the sleepless malice of his enemies, Spinoza was tutor in mathematics and modern languages, while at the same time he was taught Latin by the daughter of the master, with whom he fell passionately in love. Fortunately or unfortunately, he was rejected. From that time forth philosophy became the sole aim and object of his life.

After his separation from Van den Ende, Spinoza, feeling the need of some regular means of support, had taken to the fashioning of glass lenses for telescopes and microscopes, and, having been again in imminent danger of his life from a Jewish dagger, he withdrew, in 1661, from Amsterdam to the village of Rhynsburg, near Leyden, where he remained three years, practicing his mechanical art and meditating the deepest questions in philosophy. Besides being a master craftsman in lens polishing, he was also an expert in the art of design, and among a number of other portraits he drew one of himself in the dress of Masaniello.

In 1663, while still at Rhynsburg, Spinoza wrote his abridgment of the "Meditations" of Descartes, under the general title of "Descartes's Principles of Philosophy," with an appendix which was the first draft of his "Ethics." The year following, 1664, he removed to Voorburg, a few miles from The Hague; and then, about 1668, at the invitation of the illustrious Dutch statesman, Jan de Witt — who some time after gave him a pension of about one hundred dollars a year — he settled in The Hague itself. At first he lived at a house kept by a widow named Van Velden. Finding her house too expensive for his small income, he crossed the street to that of a painter named Van der Spyck, with whom and his good wife — and they deserve honorable mention for the great love they bore him — he spent the remaining years of his life of recluse and study. At The Hague he completed his great work, the *Tractatus Theologico-Politicus*, in 1670, and his "Ethics," about 1674, although the latter was not published until after his death.

During this period the elector of the Palatinate, Charles Louis, offered him in 1673 the vacant chair of philosophy at the university of Heidelberg, with full "liberty of teaching," provided he would not say anything to the prejudice of the established religion. It is needless to say that, with his independence and integrity of thought, Spinoza declined both the honor and the emolument of the professorship. His small pittance was enough to satisfy his wants. In a similar way he refused generous offers made to him by wealthy friends, like Simon de Vries, who offered to bestow a large sum of money upon him. All he could be prevailed upon to accept was a small annuity; the rest he persuaded his friends to settle on De Vries's own brother. An offer of a pension, on condition that he dedicate one of his works to Louis XIV., he rejected with scorn.

Spinoza's constitution was naturally frail, and during much of the period at The Hague he suffered both bodily and mentally. At last, due to the inroads of disease and overwork, he died of consumption on February 21, 1677, when in his forty-fifth year.

Distinguished for extreme gentleness and placidity of temper, and pious to a remarkable degree in the original and broader meaning of the word, Spinoza was greatly loved by all who knew him, except, of course, his acquaintances of the synagogue. His habits were of the simplest, as simple, indeed, as those of the simplest peasant. His domestic accounts, found after his death, showed that he lived on a few pennies a day. Indifferent to money, or what money could bring, he earned an honest maintenance by manual labor, and scrupulously devoted his spare time to his abstruse and difficult studies. The attainment of truth was the one object of his life, and for this he sacrificed everything for which most people hold life dear. Seldom, indeed, has the world seen such an instance of freedom from worldly and selfish ends, such disinterested and pious loyalty to the promptings and aspirations of the intellectual mind.

Although his sensitive mind was violently disturbed by the severance of all natural ties of affection — to say nothing of the misery of occasional want and of constant persecution — yet no complaint ever passed his lips. By his contemporary enemies he was charged as an epicurean and an atheist; but it has been well said, that no man, perhaps, was more filled with religion than he, and that to be an epicure and riotous liver at the rate of five or six cents a day cannot be a very serious crime.

Such was the intolerance of the times, that, for more than a century after his death, Spinoza continued to be stigmatized as an atheist, a blasphemer, and an intellectual and religious monster in general. Then his works came into marked favor with Goethe, Lessing, Novalis, and Schleiermacher.

Spinoza was not a voluminous writer, but his writings have had an extensive and enduring influence on modern thought. Few philosophers have been so rigidly logical and deeply meditative. Hallam called him a "reasoning machine," so thoroughly intellectual and rational were his processes of speculation. His first work, *Renati Descartes Principiorum Philosophiæ*, immediately gave him the reputation of a great philosopher. His second work, *Tractatus Theologico-Politicus*, published anonymously in 1670, treats the relation between church and state, and is entirely distinct from his philosophical writings. Numerous refutations of this work appeared, especially from Cartesian theologians. Averse to controversy, Spinoza withheld his other and more important works, which were first published after his death by his friend, Ludwig Meyer. His manuscripts were, in accordance with his order, sent to his publisher at Amsterdam, and within a year appeared *Ethica, Ordine Geometrico Demonstrata*, containing his pantheistic philosophy, written between 1663 and 1666; *Tractatus de Intellectus Emendatione*, and *Tractatus Politicus*, both fragments; a collection of letters to Oldenburg, Simon de Vries, Ludwig Meyer, and Bleyenbergh; and a fragmentary sketch of Hebrew grammar, aiming to give it a logical development.

The whole system of Spinoza is a demonstration from the eight definitions and seven axioms of the first book of the *Ethica*, which is really not a treatise on ethics in the modern sense, but a system of philosophy. Spinoza — like Descartes — made it his principle to admit nothing to be true which he could not recognize on sufficient grounds. He endeavored to found a system which should deduce the fundamental principles of moral life by strictly mathematical demonstrations, founded on the knowledge of God. To this end he called his system one of ethics.

"Most of the writers on the affections of man and the conduct of life," he says, "appear to treat, not of natural things, which follow the usual laws of nature, but of things beyond nature; they seem, indeed, to conceive man as an *imperium in imperio.* For they believe that man rather disturbs than conforms to the order of nature, and, further, that he possesses absolute power over his actions, being influenced and determined in all he does by himself alone. And then, they refer the cause of human shortcomings and inconsistences to no common natural power, but to some — I know not what — vice or defect in human nature, which they forthwith proceed to lament, to deride, to decry, and even more generally to loath and to execrate. So that he who discourses upon the infirmities of the human soul with more fluency and fervor than common is looked upon as a kind of divine or inspired person.

"To such persons it will doubtless appear strange that I should set about treating the vices and follies of mankind in a geometrical way, and seek to demonstrate on definite principles things which they cry out against as repugnant to reason, as vain, absurd, and even horrible. Yet such is my purpose, for nothing happens in nature that can be ascribed to any vice in its constitution, nature being ever the same, everywhere one, and its inherent power, and power in act identical. I shall in a word discuss human actions, appetites, and emotions precisely as if the question were of lines, planes, and solids."

He therefore assumes, first of all, three fundamental things, which he calls, respectively, substance, attributes, and mode. By substance he understands, like Descartes, that which needs nothing else to its existence; but, unlike Descartes, he assumed only one such substance — God. Yet this term is not to be understood in the ordinary sense, for Spinoza's God neither thinks nor creates. There is no real difference, he holds, between mind, as represented by God, and matter, as represented by nature. They are one, and, according to the light under which they are viewed, may be called either God or nature. The visible world is not distinct from him. It is only his visible manifestation, flowing out of him, who is the last fountain of life and essence, as a finite from the infinite, variety from unity — a unity, however, in which all varieties merge again.

Extension and thought, which, with Descartes, had been two substances, with Spinoza become "attributes": that which the mind perceives as constituting substance. Extension is visible thought; thought is invisible extension. The relation between substance and attributes Spinoza illustrates by the example of an object — colorless in itself, perhaps — seen through yellow or blue spectacles. And this explains the relation between body and mind, and the complete unity between them. The mind is the idea of the body — i. e., the same thing considered under the attribute of thought.

The *modus* or *accidens* is only the varying form of substance. Like the curling waves of the ocean, they have no independent existence; nay, less than these are they things of reality; but they are simply the ever-varying shapes of the substance. Substance, thus, is the only really existing, all-embracing essence, to which belongs everything perceptible to our senses, and not perceptible. Thus, every thought, wish, or feeling is a mode of God's attribute or thought; everything visible is a mode of God's attribute of extension. God is the "immanent idea," the One and All. "World" does not exist as world, i. e., as an aggregate of single things — but is one complex whole and one peculiar aspect of God's infinite attribute of extension. The variety we behold in things is a mere product of our faulty conceptions, particularly of, as Spinoza terms it, our "imagination," which perceives unity as a complex of multiplicity.

On these metaphysical speculations he founds his *Ethica*, which he deduces in a mathematical form, after the method of Euclid. The chief doctrines are: The absence of free will in man — himself only a modus dependent on causes without and not within him. Will and liberty belong only to God, who is not limited by any other substance. Good and evil are relative notions, and sin is a mere negative; for nothing can be done against God's will, and there is no idea of evil in Him. Utility alone, in its highest sense, must determine the good and the evil in our mind. Good, or useful, is that which leads us to greater reality, which preserves and exalts our existence. Our real existence is knowledge. Highest knowledge is the knowledge of God. From this arises the highest delight of the spirit. Happiness is not the reward of virtue, but virtue itself; and this is to be attained by a diligent following in God's ways. Sin, evil, negation, etc., are merely things that retard and obstruct this supreme happiness.

Spinoza's system, therefore, appears to be nothing but the most rigid, most abstract monotheism that can be conceived by man. There is only substance, only God — nothing else. It was not unnatural, however, that this system should be misunderstood either as materialism or as pantheism, seeing the word "substance," which, with Spinoza, means "existence," is, in ordinary language, associated with the idea of matter or body. Be this as it may, "this most iniquitous and blasphemous human invention," as it has been called, has become the acknowledged basis of modern German philosophy; and pious theologians like Schleiermacher did not hesitate to apply the highest terms of "pious, virtuous, God-intoxicated," to Spinoza, who, we need not add, never left Judaism, although he left the synagogue and its human formalities.

The chief good, according to Spinoza, is to live a life freed from passion, comprehending the order of things by the highest exercise of the intellect, the knowledge and love of God.

He concludes his great work thus: "In what precedes I have delivered all I wish to say in connection with the freedom of the mind. And now we are able to appreciate the wise at their true worth, and to understand how much they are to be preferred to the ignorant, who act from mere appetite or passion. The ignorant man, indeed, besides being agitated in many and various ways by external causes, and never tasting true peace of mind, lives in a state of unconsciousness of himself, of God, and of all things, and ceases to suffer only when he ceases to be; the wise man, on the contrary, in so far as he is truly to be considered, scarcely knows what mental perturbation means; but conscious of himself, of God, and of that special, eternal necessity of things, never ceases from being, but is always in possession of true peace of mind."

"Whatever else Spinozism is," says John Caird, "it is an attempt to find in the idea of God a principle from which the whole universe could be evolved by a necessity as strict as that by which, according to Spinoza's favorite illustration, the properties of a triangle follow from its definition. For the clear intelligence of Spinoza it was impossible to rest satisfied with a system in which metaphor plays the part of logical thought."

Touching his personality, A. B. Lee said on a memorial occasion: "Let us not fall short of the truth through fear of falling into exaggeration. Spinoza's life was of a beauty to which history can hardly find a parallel. On that Sunday afternoon of the 21st of February, two hundred years ago, there broke as noble and as sweet a heart as ever beat in human breast."

In summing up his estimate of Spinoza, Maccall says: "Bigotry does not like to confess its blunders, otherwise it would long have abandoned as a deplorable error and a flagrant injustice the ignorant and stupid calumny which places Spinoza foremost among blasphemers and atheists. Those who reject popular idols are always classed by popular prejudice with such as deny God; and few have suffered more from this cruel wrong than the great thinker whose career we propose to chronicle in all honesty and in no prejudiced or proselytizing spirit, and whose holy deeds are the best indication of his sublime ideas. * * * Never was high thought so nobly embodied in every action, even the most insignificant, as in Spinoza; which makes his path a fecund lesson and a blessed spectacle to many who feel nothing but distaste, and who express nothing but scorn for philosophy."

1704	Died at Oates, High Laver, Essex, . .	72

JOHN LOCKE, one of the most influential of modern thinkers, is usually regarded as the founder of the so-called sensational or empirical school of philosophy. He was born in the village of Wrington, near Bristol, England, August 29, 1632. At that time Bacon had been dead six years. Hobbes had reached middle age, and Descartes was in studious retirement in Holland. Pascal was nine years old, Milton was taking his degree of M. A., and Spinoza was born the same year.

Locke's father was a country lawyer of superior intelligence, who served under his friend Colonel Popham in the parliamentary army during the English civil war. In 1646 he was sent to Westminster school, which at that time had for head master Dr. Busby. In 1652 he entered Christ Church, Oxford. Like Bacon and Hobbes before him, Locke was disgusted with the barrenness of the studies in philosophy and theology then imposed, and gave himself with hearty interest to the classics and to the reading of Bacon and Descartes, not without admixture, it is said, of the classic romances. He took his degree of B. A. in 1655, and that of M. A. in 1658. His father, toward whom he cherished the highest respect and love, died in 1661. In the relations between father and son, and in some other particulars, Fox Bourne, one of the most appreciative biographers of Locke, points out an interesting parallel with the case of John Stuart Mill and his father, James Mill. For some time Locke hesitated as to the choice of a profession. His tendencies were toward experimental philosophy, but he at length decided in favor of medicine.

In 1665 he entered upon his political career as secretary of the British ambassador to the elector of Brandenburg at Berlin. Having acquitted himself well at this post he was offered a similar one at Madrid. He preferred, however, to continue his studies, and therefore returned to Oxford. By a special dispensation he was relieved from the customary obligation of the students of Christ Church to take orders in the church, and devoted his attention to medical studies. His early contact with medicine shows his bent to the inductive interpretation of external nature, and aversion to the unscientific methods and wranglings of the schools. He does not even appear to have taken a degree in medicine, but he launched into some sort of an amateur practice at Oxford, and attracted the attention particularly of the celebrated English physician, Sydenham. His acute diagnosis of a disease from which Lord Ashley, afterward the earl of Shaftesbury, was suffering, in 1666, gained him the friendship of that nobleman, and led to that lifelong acquaintance which was a significant part of Locke's career.

He now became a member of Lord Ashley's household, as physician, tutor to the only son, and confidential adviser on public and private concerns. He was also introduced to many eminent persons, among them the dukes of Northumberland and Buckingham, and the earl of Halifax. In 1669 he was employed at the instance of Lord Ashley and others, as proprietors, to draw up a constitution for the then American province of Carolina; but his articles on religion were deemed too liberal, and the clergy had a clause inserted, giving the favor of the state exclusively to the established church. A couple of years later, at a meeting of Locke's philosophical friends, it was suggested that some attempt should be made to settle the question with what problems the human understanding was or was not fitted to deal. This problem was undertaken by Locke himself, and continued thenceforward to occupy his best energies for seventeen years. It was issued in 1690 in the famous *Essay Concerning Human Understanding.*

Meanwhile, in 1672, when Lord Ashley — now the earl of Shaftesbury — became chancellor of Great Britain, Locke was appointed secretary of presentations, and, in the following year, secretary to the council of trade and plantations. This post brought him plenty of hard work, with merely nominal pay. In 1675 he took up his residence at Montpellier in the south of France, for the benefit of his health, and remained there several years. At Montpellier he formed the acquaintance of the earl of Pembroke, to whom his essay is dedicated.

In 1679 Locke rejoined the earl of Shaftesbury — then president of the council — in England, and he also appears to have resumed his tutorial life at Oxford. However, Lord Shaftesbury was charged with high treason in 1682, and fled to Holland to avoid trial. Locke, who was not without suspicion — though no evidence was found against him — went to Holland in the following year. Here he remained a number of years.

So obnoxious was he to the court that by an arbitrary act of the king, Charles II., he was expelled from Christ Church; and his person was afterward demanded of the states-general as a conspirator. He escaped, however, by temporary concealment. During his stay in Holland he became acquainted with Limborch, Le Clerc, and other men of mark, and published in 1686 his first work, the *Adversariorum Methodus*, a rather commonplace book on method. Here, in his enforced retirement, he also completed his great philosophical work, projected in 1670, and an abridgment of it was published in French by his friend, Le Clerc. His first letter on toleration was published in Holland in 1689.

After the revolution he returned to England in the fleet that conveyed the princess of Orange, where hearty welcomes and assured safety awaited him. By the new government he was offered the post of ambassador to Berlin, which he declined, but accepted instead that of commissioner of appeals. In 1695 King William appointed him a commissioner of trade and plantations, but he did not accept this honor until he was reappointed in May, 1696, when he immediately entered upon his duties. He became the ruling spirit of the council, and rendered services of great value in espousing the cause of toleration, and maintaining the principles of the revolution. He took a warm interest and active part in the establishment of the bank of England, the abolition of the censorship of the press, reform of the coinage, and the promotion of Irish linen manufacture.

In 1690 his *Essay Concerning Human Understanding* was published, and met with a rapid and extensive celebrity; also a second letter on toleration, and his well-known treatises on government. In 1691 he was engaged upon the momentous question of the restoration of the coinage, and published various tracts on the subject. In 1692 he brought out a third letter on toleration, which, as well as the second, was a reply to the attacks made on the first. In 1693 he published his *Thoughts on Education*, followed in 1695 by his treatise on *The Reasonableness of Christianity*, which was written to promote William's favorite scheme of a comprehension of all the Christian sects in one national church. He maintained a controversy in defense of this book, and another in defense of the *Essay Concerning Human Understanding*, against Stillingfleet, the bishop of Worcester.

His feeble health now compelled him to resign his office of commissioner of plantations, and to quit London. He spent the remainder of his life at Oates, in Essex, at the seat of Sir Francis Masham. His friendship with Lady Masham began in 1683. She was a daughter of the philosopher, Ralph Cudworth, and inherited her father's love for philosophy and learning. Her young stepdaughter, Esther Masham, was a special favorite of the philosopher. After a long decline, soothed by the tender ministrations of this family, Locke died, in the arms of Lady Masham, October 28, 1704. His remains were interred in the family tomb of his friends at High Laver church, and a tablet was set up to his memory. In 1855 the tomb, which had fallen into decay, was restored; among the contributors to this restoration were the celebrated French philosophers, Victor Cousin and Barthélemy Saint-Hilaire.

Locke was never married; but his nature was eminently social, and one of the great charms of his biography is the story of his friendships and domestic relations. He suffered habitually from ill health, but by temperate habits his life was prolonged to more than three score and ten years.

It is seldom that a personal history so much delights one as that of John Locke. Not only can no one discern a stain on the character and career of the great Englishman, but his practical career is everywhere in strict accordance with the principles he labored to establish. Firmly attached to the cause of toleration, civil or religious, he did not scruple to suffer for either or both. Neither did his opposition to any faction ever drive him from moderation and justice, disincline him to appreciate his opponents aright, or to conceal the excesses of the party whose fortunes he mainly espoused. He accepted human liberty as a basis of his philosophy, and practically stood by that. Few writers, before or since, have had a finer sense of the respect due to the determination of the personal conscience.

No one can peruse the record of a career like that of John Locke without profound admiration. It exhibited a rare combination of lofty abilities, patient industry, intelligent and unaffected piety, and unsullied integrity, with the most extensive intellectual acquirements.

Great as were Locke's services to his country, and to the cause of civil and religious liberty, his fame rests on the *Essay Concerning Human Understanding*, which marks an epoch in the history of philosophy. In it he first institutes a preliminary inquiry, in the first book, as to the existence of innate ideas, theoretical and practical, on which the philosophical world has been so much divided. Locke argues against the existence of these supposed innate conceptions, or intuitions, of the mind with a force and cogency that appear irresistible. Having thus repudiated the instinctive sources of our knowledge or ideas, he is bound to show how we come by them in the course of our experience. Our experience being two-fold, external and internal, we have two classes of ideas — those of sensation, and those of reflection. He has, therefore, to trace all the recognized conceptions of the mind to one or other of these sources. Many of our notions are obviously derived from experience, as colors, sounds, etc.; but some have been disputed, more especially such as space, time, infinity, power, substance, cause, mere good and evil; and Locke discusses these at length, by way of tracing them to the same origin. This is the subject of book second, entitled "Of Ideas." Book third is on language considered as an instrument of truth, and contains much valuable material. The fourth book is on the nature, limits, and reality of our knowledge, including the nature of demonstrative truth, the existence of a God, the provinces of faith and reason, and the nature of error.

Locke's object in his great work was, as stated by himself, "to inquire into the origin, certainty, and extent of human knowledge." Rejecting the Cartesian doctrine, he taught, generally speaking, that the mind is a mere *tabula rasa*, capable of receiving impressions through the senses; and that the ultimate sources of all our ideas were the senses and the subsequent operations of the mind upon them. He saw both the subjective and the relative nature of human knowledge, and foresaw the possibility of the idealist and sceptical systems afterward built upon his foundations. Nevertheless, he maintained the possibility of a demonstrative knowledge of the existence of God and the immortality of the soul.

Whatever may be the shortcomings of Locke's philosophy — and they are real and important — though it fails, like all other systems, to solve the problems of our being, no reader of his essay can refuse to recognize in it the work of a patient, original thinker, a sagacious observer, an accurate recorder, an earnest lover of truth, an honest and modest man. To the attractions of the subject is added the charm of a homely, racy speech, welcome and refreshing to those who love to draw from "wells of English undefiled."

As a philosopher, Locke is generally recognized as founder of the so-called sensational school. His claim to this distinction is disputed by some writers, who assign it to his predecessor, Hobbes. The fundamental principle of Locke's system — the derivation of all our knowledge from experience through the senses — is undoubtedly laid down by Hobbes with the utmost clearness. But, so wide is the difference between the two thinkers on momentous points, that it is now regarded as absurd to look upon Locke as a copier of Hobbes. Their agreement in their starting point is explained by the fact that they were both students of Bacon, and both adopted the method which he had then recently expounded in relation to physical research, and applied it to the study of mind. It is even doubtful whether Locke ever read the works of Hobbes.

The effect on general modes of thought of Locke's system of philosophy, which rapidly spread not only in his own country, but in France, Holland, and Germany, within the century following its publication, exemplifies the truth that "in every age the speculative philosophy in general acceptance will influence the theology of that age." The principles of his philosophy and psychology, as applied by Hume, led to the great system of critical philosophy by Immanuel Kant, the most momentous in all modern philosophy.

"Locke's writings," says A. C. Fraser, his biographer and expositor, "which everywhere express his character, have made his intellectual and moral features not less familiar to Englishmen than his countenance has been made by Kneller. * * * 'I can no more know anything by another man's understanding,' he would say, 'than I can see by another man's eyes. The knowledge which one man possesses cannot be lent to another.' Reluctance to believe in the dark, on blindly accepted authority, instead of faith sustained in the judgment by self-evident or demonstrative reason, or by good probable evidence, runs through his life. He is the typically English philosopher in his love for concrete exemplification of the abstractions in which more speculative minds delight; in his reverence for facts — facts in nature, or facts in conscious life; in indifference to speculation on its own account; in aversion to verbal reasonings; in suspicion of mystical enthusiasm; in calm reasonableness, and ready admission to truth, even when the truth could not be reduced to system by a human understanding; and in the honest originality which stamped the features of his intellect and character upon all that he wrote."

LEIBNITZ

A. D.		AGE
1646	Born at Leipzig, Prussia,	..
1661	Entered university of Leipzig,	15
1663	*De Principio Individui,*	17
1666	Doctor of laws, Altdorf university; *Tractatus de Arte Combinatoria,*	20
1667	Councilor of state,	21
1672–74	Visited France and England,	26–28
1676	Librarian to duke of Brunswick,	30
1684	*Regles du Calcul Differentiel,* "Differential Calculus,"	38
1692	Attempted to unite Protestants and Catholics,	46
1700	President Berlin academy of sciences,	54
1710	*Théodicée,*	64
1716	Died at Hanover, Prussia,	70

GOTTFRIED WILHELM VON LEIBNITZ was celebrated both as a philosopher and as a mathematician, and was perhaps the most extraordinary example of universal scholarship in intellectual history. He was born at Leipzig, Prussia, July 6, 1646, where his father was a jurist, and professor of natural philosophy in the university.

His father died early, and Leibnitz was left to the care of a wise mother, who allowed him great freedom in study. He learned Latin and Greek at the school of Saint Nicholas, and entered the university of Leipzig at the age of fifteen, where he studied under the philologist, Thomasius, and devoted himself, also, to philosophy, literature, jurisprudence, and mathematics.

From Leipzig he received his bachelor's degree in 1663, and presented the remarkable thesis, *De Principio Individui.* In the same year he spent some time at the university of Jena in the study of mathematics and law, and published a dissertation on certain specific difficulties in law. In 1666 he published his *Tractatus de Arte Combinatoria,* a most unusual treatise on the combination of numbers and ideas, and also presented himself for the degree in law at Leipzig. In consequence of his youth, however, it was refused by the university authorities; but a few months later he applied for and received the degree of doctor of laws from the university at Altdorf, in his twentieth year.

Leibnitz refused, in 1667, a professorship at Altdorf, and accepted instead the office of councilor of state at Frankfort. Here the friendship of Baron von Boineburg — whom he served for some time as secretary — gained him an entrée to the most cultivated society of Germany, and gave him a clear insight into the political state of Europe, which at that time was slowly recovering from religious strife. At Boineburg's suggestion, Leibnitz had dedicated to the elector of Mainz an essay on a "New Method of Learning and Teaching Jurisprudence"; under the patronage of the latter he set to work to reform German jurisprudence, and published several theological treatises. He was likewise appointed to the bench of the upper court of appeals, the supreme court of the electorate, when but twenty-four years of age.

He soon abandoned the science of philosophical jurisprudence, and extended his fame as a philosopher by republishing and annotating the *Antibarbarus Philosophus* of Nizolius, in which he ranks Aristotle above

Descartes; wrote a theological argument in defense of the Trinity, *Sacrosancta Trinitas,* aimed against the Polish Socinian Wissowatius, who had procured the erection of a temple to the harmony of the three Christian confessions; and addressed to the academy of sciences of Paris and to the royal society of London two remarkable memoirs on the laws of motion. Associated with Cassini, Huyghens, and others, he devoted himself especially to mathematics and physics, and established a European reputation by bold and striking thoughts in all departments of learning.

In 1672 Leibnitz accompanied Boineburg's sons to Paris, and there submitted to Louis XIV. an essay entitled *Consilium Ægyptiacum,* containing a plan for the invasion of Egypt, which is generally supposed to have led to the Egyptian expedition of Bonaparte in 1798. In the course of this tour he came into contact with many followers of Descartes — Arnauld, Malebranche, and, above all, Huyghens. Now for the first time he became associated with that critical period of mathematical research which, dating from the geometry of Descartes, was to culminate, four years later, in his own discovery of the transcendental calculus. In the following year public business took him for a few weeks to London, where he made the acquaintance of the remarkable group of men who had founded the royal society, and among them, Newton.

On the death of the elector of Mainz, Leibnitz declined an appointment at Paris, and entered the service of the duke of Brunswick at Hanover. Here, in 1676, he was made privy councilor and librarian, and permanently fixed his residence. His literary services to this court were of a very miscellaneous character, and he was partially occupied for six years in arranging and enriching the famous Wolfenbüttel library. He also improved the royal mines and coinage, gathered in Austria and Italy materials for a history of the Brunswick ducal house, and took an active part in the negotiations for church union between Protestants and Catholics, and the theological discussions connected therewith.

At the congress of Nimeguen in 1677 there was a dispute about the right of precedence between the princes who were electors and those who were not. Leibnitz maintained the cause of the latter in a treatise containing the ultramontane rather than the Protestant declaration that all the states of Christendom should form but a single body, having the pope for their spiritual and the emperor for their temporal head. This idea of a grand theocracy appears prominently in several of his writings, and was particularly emphasized in his protracted correspondence with the celebrated Bossuet and with M. Pelisson. It led to the preparation, on his own part, of a very curious exposition of doctrinal belief, published much later under the title *Systema Theologicum,* which, although written in the assumed character of a Catholic, was intended to form a basis of negotiation. The religious strife which had agitated Europe for a century was hateful to him as a barren waste of energy, and he earnestly desired to see the unity of Catholic and Protestant churches. Failing in this, he sought, also unsuccessfully, to reconcile the Lutheran and Reformed churches.

His private studies, however, were chiefly philosophical and philological. His correspondence on these subjects was most extensive, and he contributed largely to almost every literary and scientific journal of his day, especially to the *Acta Eruditorum* of Leipzig, of which he was one of the founders, in 1682. He was the chief organizer of the academy of Berlin, of which he was the first president, in 1700; and he originated both at Dresden and Vienna a project for the establishment of similar bodies. It was to him, likewise, that Peter the Great, who invited him to a meeting at Torgau, and bestowed on him a pension of one thousand rubles, with the title of privy-councilor, owed the plan of the since celebrated academy of St. Petersburg.

In 1704 he wrote his examination of Locke's philosophy. He published in 1710 in French his *Théodicée,* the noblest monument of his genius. The fragment on "Monadology" belongs to the year 1714. His discoveries in connection with the calculus were made even before 1684, and were fully described in the *Acta Eruditorum* in that year. A controversy with Newton concerning the discovery of the differential calculus embittered the latter years of his life. There is little doubt that Newton's method of fluxions and Leibnitz's method of infinitesimals were independent and original discoveries; but the priority of publication belongs to Leibnitz. A letter, indeed, of Leibnitz to Newton in 1677, shows the "Differential Calculus" fully formed, the first draft of the letter exhibiting also the symbol of integration. It was first fully described in the *Acta Eruditorum* of Leipzig in 1684. It is clear from the correspondence that Newton had been for some time in possession of the method of fluxions leading to similar results. But Newton had concealed his method in an anagram which, when interpreted, yields no proof that his notation, on which the value of the method depended, was fixed until a much later date. It is in any case certain that the differentials of Leibnitz proved, in the course of the two following generations, far more fertile in discovery than the fluxions of Newton.

On the accession of the elector George to the crown of Great Britain, as George I., Leibnitz was disappointed in his expectation of accompanying the prince to his new court; nor did he long survive that event. His death, which was rather unexpected, occurred at Hanover, November 14, 1716. His biographers justly complain that his memory was treated with but little honor by his contemporaries; but a tardy atonement for their neglect has resulted in the erection of a monument to him in one of the squares of the city of Hanover, and also a statue in his native city of Leipzig.

The real life of such a man is in his character and writings. With regard to the first, Fontenelle is probably our best authority. He had a strong constitution, ate a good deal, drank little, and never undiluted liquors. Many of his habits were in strange contrast with his philosophy. When alone, he always took his meals as his studies permitted. His chair was frequently his only bed, and in this way he is said to have sometimes passed whole months. He communicated freely with all classes of men, and could entirely divest himself of his character of a philosopher. His correspondence was immense; he answered every one who wrote, however small the pretext for addressing him. He was of a gay humor, easily excited to anger, and easily appeased. He lived at great expense, but had preserved and hid two years' amount of his salary. The securing of this treasure gave him great uneasiness, and upon this slight ground he has been charged with avarice. He took so little exercise that during his later years he suffered greatly in his lower limbs, and often lamented that they were not as sound as his head and stomach.

Leibnitz was small of stature, slightly bent, with large hands, and small piercing eyes. He was never married; but it is said that he contemplated such an alliance at the age of fifty. The lady of his choice desired time to consider. "This," says his biographer, "gave Leibnitz the same opportunity, and he continued unmarried."

The most important of the works of Leibnitz — in addition to his "Calculus" — are the "New Essays on the Human Understanding," in which the opinions of Locke are controverted; the "Theodicy: on the Goodness of God, the Liberty of Man and the Origin of Evil"; "Pre-Established Harmony," a theory of optimism; and his "Monadology," in which is developed his system of metaphysics. It is difficult to convey, in popular language, a correct notion of his system as a whole, for the reason that he has nowhere reduced it to an orderly presentation himself.

The ambition of Leibnitz was to conciliate all things. "I have been struck," he said, "with the idea of a new system, for I believe I see the interior of things in a new light. This system would reconcile Plato with Democritus, Aristotle with Descartes, the scholastics with the moderns, theology and morals with reason. I would take the best from all, and push the matter further than it has yet gone."

Locke's doctrine that our ideas were due to external impressions was unacceptable to Leibnitz. Nothing in the intellect, said the schoolman and Aristotle, that was not first in the sense — except, replied Leibnitz, the intellect itself. External influences merely bring into activity what is already there. It was the problem of the mutual action of organism and environment, which was afterward studied by Kant far more systematically.

According to Leibnitz, nature and spirit correspond, the laws of thought are those of things. If we would comprehend the first principles of nature, let us study our reason. Reason has two great laws which it applies as soon as experience furnishes occasion. The first is the axiom of contradiction: that at the same time and under the same conditions a thing cannot exist and yet not exist; the second is the axiom of sufficient reason: nothing can exist without a reason which suffices to explain it.

The axiom of contradiction corresponds to the possible, that of the sufficient reason to the actual. But it is not enough that a thing exists actually, as established by the axiom of contradiction; there must still be a sufficient reason why it has passed into existence and is realized in creation. This reason, according to the *Théodicée* of Leibnitz, is order, suitableness, and harmony, the universal well-being. In the mind of man the principle ought to be established that all is good, that all is beautiful, that all is regular, and in order; that nothing exists which ought not to be.

Experience without reason only furnishes the connections or associations of images as those which serve to guide animals. Man, alone, according to Leibnitz, is acquainted with the chain of reasoning. And what is there innate in this faculty? Itself. This theory sufficed to overthrow that of the sensualists defended by Locke, who had affirmed it.

In possession of the great laws of the intelligence, the next step is to proceed to the study of things themselves, to go from the ideal order to the real order, which is only an expression according to Leibnitz, who affirmed that in nature reason found only itself.

Space, he argued, is not a real existence, but a pure relation of coexistence. To attribute to it a proper reality is to admit, as Descartes has seemed to do, the passivity of substances and to introduce into the universe inertia and torpor. Leibnitz had barely escaped being seduced by this system earlier in life. But he felt its insufficiency, and to the pantheism of Spinoza, to the occasional causes of Malebranche so nearly related to Spinoza, to the purely mechanical theories of Descartes, he opposed the activity of the individual substance. To be, is to act. Creative act did not produce simply phenomena which would be then only the modes of God, but it deposited in beings a force or intimate virtue, from which could proceed naturally their actions as well as their passions. If mechanism accounts for visible nature by the laws of motion, it does not give the invisible reason of these laws nor the reason of motion, and consequently does not explain itself. In a word the surface of things is explained by mechanism, while the depths of things can be explained only by dynamism.

Leibnitz spent much thought in reconciling the belief in an omnipotent and benevolent Creator with the existence of moral evil. His solution was that evil was permitted for the sake of greater good. Good, he conceived, immensely preponderated over evil; and much of it, but for evil, could never have come to light. A world free from evil might have been created; yet the good in that world might have been of so much lower sort as to stand, on the whole, lower than that in which we live. It might have been arranged that the crime of Tarquin should not have been permitted; but in that case the Roman republic, with its vast influence for good, would not have arisen. God then foresees and permits evil; but we must believe that He has created out of all possible combinations that world which on the whole was best.

"The theodicy of Spinoza," says Baring-Gould, "had started from a substance, one, infinite, the base of the world, impersonal and undetermined. Leibnitz opposed to this the hypothesis of a living primal force. Matter, which Anaxagoras and Plato among the ancients, and Descartes and Spinoza among the moderns had regarded as inert, became in the system of Leibnitz the sensible revelation of motion, life and force. Spirit he supposed to be, not thought only, but a virtuality, an essence endowed with original ideas, which are not innate in man under an adequate form, but exist *virtualiter*, *potentialiter*.

"Spinoza deduced all things from the sole substance, and was consequently obliged to sacrifice individualities to the unique general being. Leibnitz, on the contrary, considered all things as the reunion of an infinite number of essences or independent forces, active, living, distinct, indivisible, imperishable, without form or extension, to which he gave the name of monads, that they might not be confounded with the atoms of Democritus and Epicurus. Each of these monads differs from the other, not in kind but in degree. Each is a little complete being in itself, and reflects as in a mirror the entire universe or God.

"The world is an assemblage of these monads. Each monad, by virtue of the independent inherent force in it, is without natural relationship to the other monads. Their bond of union is a 'preëstablished harmony,' as Leibnitz called it, in virtue of which, without destroying the independence of these primitive forces, he considered them to be so constituted that their mutual development in no way clashed, but on the contrary worked toward a harmonious end. The preëstablished harmony is due to God, the author of these living monads."

The scholarship of Leibnitz, as regards the vastness of its range, is probably unexampled.

He was eminent in languages, history, divinity, philosophy, political studies, experimental science, mechanical science, and even belles-lettres. He was perhaps the first among the modern philosophers to read the literature of opinion in an eclectic spirit, with an appreciation of all the great systems of the past, and a recognition of the mutual relations of different systems.

In the course of his immense reading it was his habit to make extracts in his common-place book, and to note, often on fragments of paper, his critical remarks on what he read. His extraordinary memory made it almost unnecessary for him to refer afterward to what he thus wrote, for Leibnitz was one of those prodigies of memory of whom many anecdotes are recorded. He forgot almost nothing that he had once read or heard. In his old age he could recite the most beautiful passages of the ancient classics, and whatever else he had read in his youth. But though he read much he reflected more. In most parts of knowledge it may be said that he was essentially self-taught, because he always struggled for deeper insight into things than that attained by other minds. He preferred solitary meditation to conversation, but when once roused in social intercourse he spoke with interest, and even indulged in playful sallies. In accordance with his liberal and tolerant spirit, it was his habit to speak well of others, and to put the best construction on their words and actions. "When I err in my opinion of men," he often said, "I prefer to err on the side of charity, and so too as regards their writings. I seek there for what is worthy of praise, rather than of blame; and there are few books or persons whence I may not in some form draw wisdom and useful instruction." Such was the spirit of Leibnitz, and to these comprehensive sympathies we may trace the modern philosophy of the history of man and of human opinion.

1776	Died at Edinburgh, Scotland,	65

DAVID HUME, the famous Scotch philosopher and historian, was born in Edinburgh, Scotland, April 26, 1711. His family was of noble origin, but poor. His father's house and estate, Ninewells, were in Berwickshire. The family was a branch of that of Lord Home, or Hume, who figured in the French wars of the fifteenth century.

David was the youngest of three children, and these were brought up carefully by the mother, the father having died in David's infancy. David, who inherited from his mother his intellectual acuteness, was sent at an early age to study at Edinburgh, and was destined for the profession of the law. But his taste for literature and philosophy was too strong to permit him to rest contented with any other pursuit. He therefore remained at home studying closely. After a few years he made trial of business in a merchant's office at Bristol, England, but commerce was less congenial to him than law, and he gave it a very short trial.

Student life now became a confirmed passion with him, and he devoted himself to books with no settled practical object before him. He has recorded in his memoirs his sufferings at this time from despondency and depression of spirits, caused, apparently, by the effects on the stomach of monotonous study. At twenty-three years of age he went to France, and lived some time in La Flèche, where he describes himself as wandering about in solitude, and dreaming the dream of his philosophy. Here he wrote his first work — *A Treatise of Human Nature* — the materials for which he had been long gathering. This work was published in 1739, after his return to Great Britain, and contained the germ of his philosophy, and still, perhaps, the best exposition of it, since it has a freshness and decision approaching to paradox, which he modified in his later works.

Although written at the dawn of a new era in philosophy, this book was little noticed. It was a work of demolition. By separating the impressions or ideas created on the thinking mind by an external world from the absolute existence of that world itself, he showed that almost everything concerning the latter was taken for granted, and he demanded proof of its existence of a kind not yet afforded. It was thus that he set a whole army of philosophers at work, either to refute what he had said, or seriously to fill up the blanks which he discovered; hence he originated both the Scotch and the German school of metaphysicians.

From the fact that his philosophical treatise was far from a financial success, Hume forsook the path of philosophy for some time, and turned to themes which appeared to promise better remuneration. In 1741 and 1742, consequently, appeared two volumes of *Essays*, dealing with morals and politics. In these he showed so great a capacity for political speculation, and ran so far ahead of received opinions, that he has been called the father of the liberal and rational policy. In literary style the *Essays* far surpassed the *Treatise*, and they met with immediate recognition. In 1745, after a fruitless attempt on the part of his friends to get him a professorship of ethics at the university of Edinburgh, he accepted, for a large salary, the post of companion or guardian to the weak-minded young marquis of Annandale, and had to mix with the jealousies and mercenary schemes which naturally attach to such a position. He bore the infliction for a year, and then escaped from it.

In 1746 he became secretary to General St. Clair in the expedition intended for Canada, but diverted to France. He also attended St. Clair on his mission to Turin and Vienna, both as secretary and aide-de-camp. During his absence his *Philosophical Essays Concerning the Human Understanding*, a popular recast of the *Treatise*, with some important additions, were published. After his return to London in 1749, he heard of his mother's death, which moved him to a greater show of tenderness than did any other event of his life. During the next two years he wrote, at Ninewells, his *Enquiry Concerning the Principles of Morals*, his *Political Discourses* — the second series of *Essays* — and his *Dialogues on Natural Religion*. The last named was not published until after his death; but the *Enquiry* and the *Discourses* appeared at once, and the latter won a great success. In these *Discourses* the principles of political economy were expounded a quarter of a century before the appearance of Adam Smith's *Wealth of Nations*, whose author was one of Hume's intimate friends.

About this time, too, he made an unsuccessful attempt to obtain the chair of logic at the university of Glasgow, and after his failure settled at Edinburgh, where his sister presided over his house. In 1752 he was elected librarian to the faculty of advocates, a post which gave him access to a large library, and thus encouraged him in his next important undertaking, the *History of England*. The first volume of this work, containing the reigns of the first two Stuarts, appeared in 1754, and excited the wrath of all parties alike. The second volume, issued in 1756, was well received, but the next two, which followed in 1759, and treated of the house of Tudor, gave general offense as the first had done. Hume published, in 1757, his *Natural History of Religion*, which was violently assailed in a pamphlet supposed to be written by Dr. Hurd, but now definitely considered to be the work of Warburton. Two other dissertations, intended to accompany these, were cancelled by him after they were printed — *On Suicide* and *The Immortality of the Soul* — but were subsequently included in his works.

The *History of England* was completed by the publication of the earlier portions in 1754–61. Through this work Hume took rank as the first eminent historian in Great Britain, the first endowed with the habits of a philosophical inquirer and master of a fine literary style. Of his style, indeed, he was far more careful than of accuracy. The general criticism of it was that the time spent in the production of the history was too short to justify adequate original research. Moreover, a strong partisan spirit inspired the narrative, and, in process of revision, this fault was designedly exaggerated, so that, as has been said, all the lights of the book are tory and all the shades whig. This may well surprise the readers of Hume's political writings, in which his doctrines are not only liberal, but most democratic. The *History*, however, long held its ground as the chief authority on the subject, and is still one of the historic classics.

In 1763 Hume accompanied Lord Hertford, British ambassador to France, and became secretary to the embassy, with a salary of one thousand pounds a year. At Paris, where his reputation as a philosopher stood very high, he was petted and lionized by society as Voltaire was to be some years later. He became familiar with the brilliant wits and *savants* of the Parisian circle — with Turgot, D'Alembert, Helvetius, Holbach, Diderot, Buffon, Malesherbes, Crébillon, and the rest, as well as with the no less distinguished female eminences, De Boufflers, Page de Boccage, Geofrin, DuDeffand, and L'Espinasse. After Lord Hertford's departure Hume remained as *charge d'affaires*, returning to England in 1766. While in France occurred the episode of his friendly intervention on behalf of the restless, vain, and self-tormenting Rousseau, resulting in a quarrel, in consequence of the insane hallucinations of the latter and his charges of treachery against Hume.

From 1767 to 1769 Hume held the office of British under-secretary of state, and then finally retired to Edinburgh, where he built a house and expressed his purpose to reside for the rest of his life. Hume's success was the beginning of the brilliant period of literary culture and society at Edinburgh, and his house became the center of attraction. In 1775 began the illness which was to prove fatal. Distinctly aware of this, he wrote *My Own Life*, a simple, cheery, and also, it may be added, a very appreciative record. He died at Edinburgh, August 25, 1776, and his remains were interred in the old burial ground on Calton hill, that city.

Hume's philosophical writings do not form a complete system, but he discusses many of the salient ideas of philosophy, in a bold, penetrating, and original manner. His reasonings were the outcome of the empirical philosophy of Locke, and have been frequently assailed as sceptical and destructive. He was the first to see clearly that the great starting point of Cartesian philosophy — the fact of self-consciousness — was not more amenable to demonstration than was our belief in the existence of an outer world. That we possessed both these beliefs was certain, in common probably with the higher animals; but to prove their validity, or to discuss the nature of their objects, was not possible for man.

Limiting himself, therefore, to phenomena, Hume went on to explain that the materials of our knowledge are of two kinds: vivid impressions and faint impressions. To a series of vivid impressions of form, color, weight, texture, etc., constantly found in conjunction, we attach by an instinctive belief the notion of external body. Of these vivid impressions there are faint echoes or repetitions. These, to distinguish them from the vivid impressions, Hume, following Locke, called ideas.

If the idea of an apple results from the vivid impression of an apple, does not the first prove the existence of the second, since every effect must have a cause? Here we come to the most salient point of Hume's philosophy, the elimination of the conception of cause, as nothing but a mental figment. "The idea of cause and effect," he says, "is derived from experience, which, presenting us with certain objects constantly conjoined with each other in a certain order, produces such a habit of surveying them in that relation, that we cannot without a sensible violence survey them in any other." Two vivid impressions being constantly seen in sequence, the belief arises in our minds, not merely that one will be followed by the other, but that the first possesses power to produce the second. A billiard ball in motion strikes another, and there ensues the motion of the second ball. This, said Hume, is all that we can assert with philosophical certainty. To maintain the existence of a power in the first ball to produce the motion of the second is to go wholly outside the limits of our knowledge.

The objection has been made to this view, that night always follows day, yet that day is not regarded as the cause of night. But here we have a cycle, not a succession. Day follows night as well as precedes it. Placing an opaque body in the line of the sun's rays, we mark that a shadow results, and we say that the body is the cause of the shadow. This assertion of a cause, of a power to produce, is called by Hume a mental fiction, or habit, from which, however, we cannot escape. Hume extends this view to impressions arising from an internal source. A man determines to raise his arm. The volition is followed by the contraction of certain muscles. To introduce a mysterious agency called will, or force, as explanatory of the sequence of the contraction on the volition, does not help us forward in the least. A similar train of reasoning led to his remarkable analysis of the fact of belief, as a "vivid idea related to or associated with a present impression."

Having thus laid the foundation of his method, and demonstrated the futility of metaphysical discussion, he passed, in his *Essays*, to other subjects. Among them are a series of very valuable studies on commercial and industrial relations.

His ethics, contained in his *Enquiry Concerning the Principles of Morals*, rightly regarded by himself as his most important work, is a striking example of the application of his method to the highest order of phenomena. Avoiding all speculation as to the origin of evil, or as to the existence of a special faculty for the discernment of right and wrong, he asked two plain questions, susceptible of a definite answer: (1) What are the actions and motives which men in all ages and countries praise or condemn? (2) Can we see how this praise and condemnation arose? The first was a question to be solved by induction from facts; the second by demanding a law of filiation or evolution.

With admirable clearness and directness of illustration, he shows that virtue, or personal merit, consists in the possession of mental qualities useful or agreeable to the person himself or to others. Not that men's approbation of these qualities rests upon an elaborate calculation of personal interest. It is instinctive and immediate, and operates where no such interest is involved. Gradually, as the social state widens from the family to the tribe, and from the tribe to a large political community, the qualities tending to the good of that community are more keenly recognized. The instinct of benevolence, of a fellow feeling with others, is innate in human nature. Crushed at first by coarser animal passions, it gradually asserts itself, because, unlike the other instincts, it arouses no antagonism, and can be indulged by all simultaneously. This instinct, therefore, is the principal source of morality. In Hume's remarkable study, the *Natural History of Religion*, though fetichism is not clearly distinguished from polytheism, yet the origin of fetichism — that is to say, the passions — is clearly indicated. "There is an universal tendency," he says, "among mankind to conceive all beings like themselves, and to transfer to every object those qualities with which they are familiarly acquainted, and of which they are intimately conscious. We find human faces in the moon, armies in the clouds; and by a natural propensity, if not corrected by experience and reflection, we ascribe malice and good will to everything that hurts or pleases us."

Taking his philosophic writings as a whole, Hume's great distinction is, that by his acute investigation of the nature of man, from the point of view of Locke's system, he gave to philosophical scepticism a strength and logical consistency which it never had before. Locke had taught that all our knowledge was derived from experience; Berkeley had followed and proved that we have no experience except that of ideas; and that, therefore, matter is a figment. Hume went still further, and, as some one has said, had courage to follow truth to the very bottom of her well, and showed that mind is a figment, too. Both Locke and Berkeley foresaw this possible issue, but shrank back from the abyss.

"Hume," says George Henry Lewes, "deserves the gratitude of mankind for having brought philosophy to this pass. Mankind, however, has paid him with execration."

Perhaps the most memorable result of Hume's philosophical conclusions was that it awakened Kant to a sense of the necessity of fresh investigation, more searching and more profound, and thus became the occasion of the birth of the critical philosophy. But he, also, anticipated some of the advanced speculations of the present day. His influence has told upon many of the writers who have since influenced the world, and it is still far from being exhausted. Notwithstanding his remorseless criticism, both philosophical and religious, he always treated his subject with gravity and decorum, never employed ribaldry, and seldom even wit in support of his views. Among his closest friends were men of known piety and some of the religious leaders of the day.

The character of this distinguished man has often been misunderstood and misrepresented alike by friends and foes. His nature was a great one, but not developed in some most vital directions. No man of his time had a stronger understanding, larger intellectual capacity, finer tastes, higher courage, or more deeply rooted love of independence. His disposition was mild, benevolent, and generous; his temper even, placid, and gay. He was fond of society, and extremely beloved by those who associated with him. Always soaring above the petty prejudices of mankind; guarded in his own conduct, and indulgent toward that of others, he preserved his own life and character from calumny; and it was only by his works that he was so often the object of malignity and hatred. He died as he lived. Attacked by a slow but incurable disease, he beheld without dismay the gradual diminution of his strength; and preserved almost to his last moments his ardor for study, his habitual serenity, and even gaiety of temper. A few days before his death, he said to his physician, "I am going as fast as my enemies, if I have any, can wish, and as calmly as my best friends can desire."

In his memoir written by himself, he describes himself as follows: "I am, or rather was — for that is the style I must now use in speaking of myself, and which emboldens me the more to speak my sentiments — I was, I say, a man of mild disposition; of command of temper; of an open, social, and cheerful humor, capable of attachment, but little susceptible of enmity; and of great moderation in all my passions. Even my love of literary fame, my ruling passion, never soured my temper, notwithstanding my frequent disappointments. My company was not unacceptable to the young and careless, as well as to the studious and literary; and as I took particular pleasure in the company of modest women, I had no reason to be displeased with the reception I met with from them. In a word, though most men, anywise eminent, have found reason to complain of calumny, I was never touched, or even attacked by her baneful tooth; and although I wantonly exposed myself to the rage of both civil and religious factions, they seemed to be disarmed, on my behalf, of their wonted fury.

"My friends never had occasion to vindicate any one circumstance of my character and conduct; not but that the zealots, we may well suppose, would have been glad to invent and propagate any story to my disadvantage, but they could not find any which they thought would wear the face of probability. I cannot say there is no vanity in making this funeral oration of myself, but I hope it is not a misplaced one; and this is a matter of fact which is easily cleared and ascertained."

The great economist, Adam Smith, said that Hume approached "as nearly to the idea of a perfectly wise and virtuous man as, perhaps, the nature of human frailty will permit." This statement is probably colored by the enthusiastic glow of a warm admirer; but certainly no one can justly impeach either Hume's honesty of intellect, or the attitude of his heart. "For kindly David Hume," says Professor Huxley, "the damnation of one man is an infinitely greater evil in the universe than the subversion of a thousand million of kingdoms. And he would have felt with his countryman Burns, that even 'auld Nickie Ben' should 'hae a chance.'"

KANT

A. D.		AGE
1724	Born at Königsberg, Prussia,	..
1740	Entered the university of Königsberg,	16
1746	"The True Measure of Living Forces,"	22
1755	"Natural History and Theory of the Heavens"; Ph. D.,	31
1770–97	Professor of logic and metaphysics, Königsberg,	46–73
1781	"Critique of Pure Reason,"	57
1784	"Ideas About Universal History from a Cosmopolitan Point of View,"	60
1788	"Critique of Practical Reason,"	64

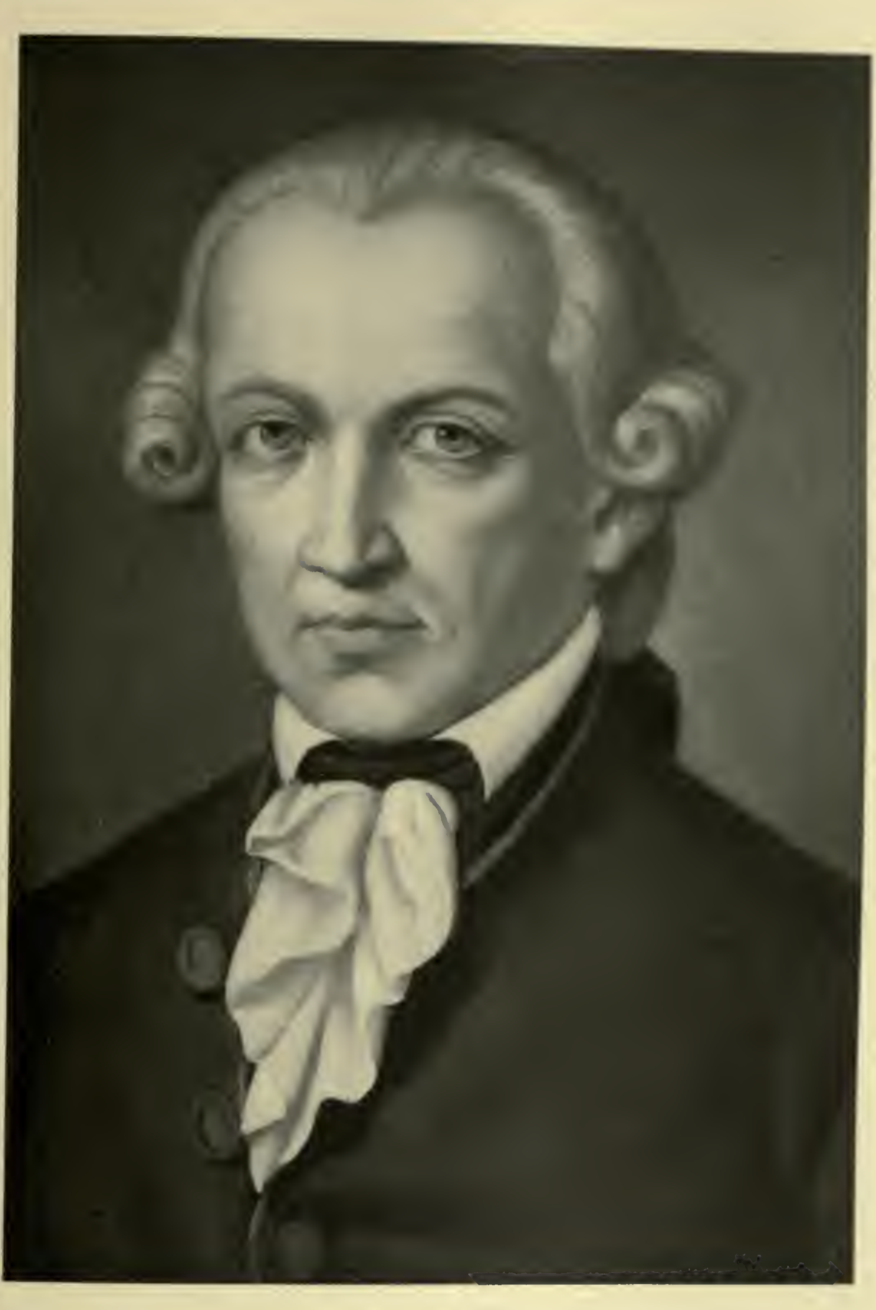
1798	"Anthropology from a Pragmatic Point of View,"	74
1804	Died at Königsberg, Prussia,	80

IMMANUEL KANT was one of the very greatest thinkers of all time, and the founder of the so-called critical philosophy. He was of Scotch descent, and was born in Königsberg, Prussia, April 22, 1724. His father was a saddler and strapmaker, extremely poor and exceedingly honest. His mother was innately pious, and with his early instruction, which was entirely religious, Kant acquired that reverence and love of sincerity which so markedly influenced his character and writings in later life.

He was educated at the expense of his uncle, at the university of his native town, which he



IMMANUEL KANT

From a painting

entered in 1740. He pursued the study of mathematics and the sciences with great delight, and gave much attention to theology. History and poetry remained comparatively neglected. For nine years he was a family tutor, and, in the year 1755, he received from his university the degree of doctor of philosophy. In the same year he published an essay on "Natural History and Theory of the Heavens," in which he was the first to suggest the theory of the nebular hypothesis. He had previously, however, when but twenty-two years of age, published an extraordinary treatise on "The True Measure of Living Forces," which contained an acute criticism of the arguments of Descartes and Leibnitz.

Shortly after receiving his doctorate, Kant settled as a docent at the university, and delivered lectures on logic, metaphysics, natural philosophy, and mathematics. In 1762 appeared his work on the "Only Possible Ground of Demonstrating the Being of God," proposing a new form of the ontological proof, and rejecting the other three arguments. Existence, he says, is not a predicate conception, and, therefore, cannot be proved; but the non-existence of God contains a logical contradiction. In 1770 he obtained the chair of mathematics — after declining the chair of poetry in 1762 — but soon exchanged it for that of metaphysics and logic, which he occupied until 1797, seven years before his death. During this period of almost half a century occupied in professorial duties at the university of Königsberg, he evolved his philosophical works.

His inaugural dissertation, "Form and Principles of the Sensible and Intelligible World" — *De Mundi Sensibilis atque Intelligibilis Forma et Principiis* — contains germs of his metaphysical system. In 1772 he wrote about his scheme of a transcendental philosophy, which he hoped to finish in three months; in 1776 it was to be completed the next summer; but not until 1781 did the "Critique of Pure Reason" — *Kritik der reinen Vernunft* — make its appearance. In 1783 appeared his "Prolegomena to every future System of Metaphysics claiming to be a Science," a more popular exposition, and also a more complete analysis, of the questions and problems mooted in the "Critique." He then endeavored to counteract the negative results of the system of pure reason by his "Foundation of the Metaphysics of Ethics" — *Grundlegung der Metaphysik der Sitten* — in 1785, and "Metaphysical Elements of Natural Science" — *Metaphysische Anfangsgründe der Naturwissenschaft* — issued in 1786, completing the exposition of his views in these two branches of philosophy. In 1787 he published the second edition of the "Critique of Pure Reason," omitting the preface to the first edition, and altering it so as to avoid the charge of idealism which had been generally preferred against his speculations.

The "Critique of Practical Reason" — *Kritik der praktischen Vernunft* — published in 1788, was intended to give the positive aspect of the new philosophy in relation to God, freedom, and immortality. It is a further exposition and application of what was given in outline in the "Metaphysics of Ethics," and it contributed to give currency to his system among those who had been repelled by the apparently negative conclusions of the "Critique of Pure Reason." To these works, in 1790, Kant added his "Critique of Judgment" — *Kritik der Urtheilskraft* — which developed more fully the principles of the metaphysics of the natural sciences, and supplemented many positions in his other treatises.

With the latter work closed the productive metaphysical period of Kant's philosophic career. His subsequent writings form, according to his own statement, its practical period, applying to different special sciences the principles he had elaborated. The more definite conflict of his philosophy with the orthodox theology was aroused by the publication of his essays on "Religion within the Bounds of Mere Reason" — *Die Religion innerhalb der Grenzen der blossen Vernunft* — in 1793. In 1797 appeared his "Metaphysics of Ethics" — *Der Metaphysik der Sitten* — in two parts, viz.: the "Metaphysical Elements of Right," and "of Virtue." The "Strife of the Faculties," issued in 1798, is a review of the controversy about his religious opinions, with the documents concerning it. His "Anthropology from a Pragmatic Point of View" — *Anthropologie in pragmatischer Hinsicht* — was published the same year. Besides his larger works and essays, Kant also wrote many minor treatises, sufficient to have made a literary reputation for most men. In 1784 he published an essay entitled "Ideas about Universal History from a Cosmopolitan Point of View"; and in 1795, a "Project of Perpetual Peace."

Kant died February 12, 1804, in his eightieth year, having never in the whole career of his life, it is said, traveled more than forty miles outside of his native city. Sixteen days after his death, on February 28th, a public funeral was accorded him. His remains were buried in a vault in the university church, and were followed to their last resting place by his familiar friends, by students of the university, and by hundreds from the city and neighborhood. People of all sorts and conditions vied with one another to do honor to his memory as a man of genius, and to pay their final tribute to his worth. He left a modest fortune, and a library of four hundred fifty volumes.

Kant's external life was one of the utmost regularity and simplicity. He was a man of small stature and frail body, but by rigid rules he kept in tolerable health, and never had a severe illness until worn out by advanced age. He was never married; philosophy was the passion of his soul; and his whole career seems to have been shaped by his definite theory of morals.

His household consisted of an old manservant and a cook. Summer and winter he arose at five minutes before five, and at five o'clock precisely was seated at his breakfast table, where he drank two cups of tea, and smoked a pipe, while laying out his day's work. At seven he went to give his lecture at the college. Then he returned and worked until a quarter before one o'clock, which was his dinner hour. He always had an invited guest; but if by chance he saw himself likely to dine alone, the servant was obliged to go into the street and ask in some passer-by. During the meal he talked on all subjects, philosophy excepted, and tenaciously held to his pet theories on electricity, etc.

After dinner, always long, came the daily promenade, when at half-past three, as regularly as the church clock struck, he emerged from his house and entered the small street, which after his death was called the "philosopher's alley," there to walk back and forth eight times, respectfully saluted by the old burghers, and, in threatening weather, anxiously followed by the faithful servant with an umbrella under his arm. Kant assigned as his reasons for this promenade the opportunity it gave him to meditate, and at the same time to breathe the air through the nose only, so that the air might be softened before reaching the lungs — a rule of hygiene which he held to be invaluable in preventing colds and coughs.

On reëntering the house, he read the scientific and political journals until six o'clock, when he commenced work. In order that his thinking should be agreeable and without distraction, he always occupied a certain place, before the window overlooking the castle at Königsberg, and the heat must always be just fourteen degrees centigrade summer and winter. He imagined himself sick if it varied ever so little.

He was always much occupied with his health; wore silk stockings attached by cords to his waist — because he conceived that garters impaired the circulation of the blood — detested beer, and, in short, all the arrangements of his person and living were as complicated almost as his metaphysical treatises. He retired at ten o'clock, terminating the evening with reading, and methodically putting away all ideas likely to prevent or trouble his slumbers. He always slept in a perfectly dark and cold chamber, where the windows were kept closed on principle, summer and winter, in spite of all theories in favor of change of air. He knew neither passion, suffering, nor unhappiness, except by name; he was simply a thinker and an observer in the world, devoted entirely to study.

In general society in his earlier life he was sometimes odd, but also genial and animated. He was a capital listener, could tell a good story, and commented on all matters of literary, philosophical, or political interest, with freedom and thoughtfulness. In general literature his reading was very large; but the most brilliant oratory he considered to be merely "delirious prose."

In his political views he warmly sympathized with the most thoughtful spirits of the age. Man, he says, is born free. His great political idea was that there must be a separation of the powers in the state to secure a true social order. He was a zealous advocate of freedom of opinion and freedom of the press. He sympathized with the American colonies in their struggle against Great Britain, and also with the French people in their revolt against monarchical abuses.

Kant's religion, it must be confessed, was not of the conventional type, but of a broader and more liberal description — the religion of the philosopher rather than of the ecclesiastic. With him the feeling of pure obligation on an inexorable duty was paramount;

in fact, his sense of duty was so strong as to leave little room for religious sentiment. He defined religion as "the recognition of our duties as divine commands"; nor did the positive truths of Christianity as a redemptive system modify either his metaphysical or ethical theories. Of the church itself he had a noble idea, but did not find it realized in the church of the day. Hence he held aloof from them, and, indeed, is said during his manhood never to have entered a church door at all. His repugnance to the spirit of sectarianism was so great — but the spirit of sectarianism was far more rampant than it is now — that he refused to ally himself with any religious body or denomination whatever. He claimed that they should really be one, but as they were, each was infected with a spirit of bigotry and intolerance quite the reverse of charitable toward all others with which there happened to be a conflict of opinion. With such feelings Kant had no sympathy. His life was severely pure, and his benevolence great. He lived up consistently to the light he had, and trusted in providence with the confidence of a child. "I fear not," said he, "to die. If this very night the summons of death were to overtake me, I should hear it with calmness; I should raise my hands to heaven and praise God!"

It is a difficult task to describe Kant's philosophical system within brief limits — or, indeed, within any limits, brief or otherwise. The important principle resulting from it is the conception of knowledge as resulting from the interaction of two factors — one supplied by the outer world, the other by the structure of the human mind. Thus Kant's fundamental principle is a special instance of the essential fact, first indicated by Comte, and subsequently illustrated with such fullness by Spencer, which constitutes life of every kind, the action and reaction, tending toward adjustment, between organism and environment.

The starting point and the most important development of this great system is the "Critique of Pure Reason," which was the result of twelve years of prodigious thinking. This masterpiece is a direct antithesis of the *Novum Organum* of Bacon. Its leading object was to check philosophical scepticism, particularly as expounded by Hume, and in a less degree by Bacon and Locke. The doctrine had been propounded that all our knowledge is derived from sensational experience, and that, because it is so, no absolutely certain knowledge is possible to us as human creatures — since all that we know, or can know, of things external to ourselves is resolvable into our sensations, which may be delusive and phantasmal altogether. We think we recognize things without us, but we really recognize nothing but our sensations within. Kant argues, and endeavors to show, that this view is a mistaken one.

"That all our knowledge begins with experience there can be no doubt," says the opening paragraph, "but though all begins with experience, it by no means follows that all arises out of experience." "There exists a knowledge independent of sensuous impressions, a knowledge *a priori*." "Philosophy," he declares, "stands in need of a science which shall determine the possibility, principles, and extent of human knowledge *a priori*." Such a knowledge is given to us by intuition; on this he founds his metaphysics, the transcendental philosophy.

Space is not a concept or derived from outward experience. Space is a necessary representation *a priori*. Space is the subjective condition of the sensibility and the necessary foundation of external perception. Time is not a conception derived from outward experience. Time is the formal condition *a priori* of all phenomena whatever; space is the condition of external phenomena alone. Time and space have no empirical reality, but an absolute and transcendental reality. These two elements are all that are pure intuition. All other conceptions appertain more or less to sensibility; motion, for example, unites both these elements and presupposes something movable, a perception besides.

From the two intuitions, the primary elements, we come to consider the four conceptions of the understanding, the secondary elements. Two of these are mathematical, quantity and quality; the other two are dynamical, for instance, cause and effect, necessity. From these his logic gave to Kant his whole tree of categories as syntheses in correspondence with the analyses of the functions of judgment — his twelve categories being unity, multitude, allness; reality, negation, limitation; substance, causality, reciprocity; possibility; actuality; necessity. In like manner he arrived at the three ideas, the objects of psychology, cosmology, and theology, or the soul, the world, and God.

The soul is substance, a simple unity; its qualities are immateriality, incorruptibility, personality, spirituality, animality, and immortality. The world suggests to us ideas of a beginning, limits, parts, and liberty — spontaneity — and also necessity. By world we mean the mathematical whole, by nature the dynamical whole. The world has a beginning in time and is limited in space; it is made up of simple parts, a casuality of freedom is necessary; there exists a necessary being as its cause.

Of God, termed the Ideal — Plato's idea of the divine mind — two ideas are given; the deist cognizes the existence of a supreme being by pure reason alone, the theist discerns him by analogy with nature; to one he is the cause of the world, to the other he is its author. All recognition begins with intuitions, proceeds from them to conceptions, and ends with ideas.

Reason asks the questions, what can I know, what ought I to do, and what may I hope? The legislation of human reason has two objects, nature and freedom; the philosophy of nature relates to that which is; that of morals to that which ought to be: thus we have two principal sciences of reason, mathematics and ethics.

So far the philosophy of Kant is severely critical, even purely negative and destructive; but his stoical morality would not allow him to rest satisfied with merely negative results. He therefore came forward with this "Critique of Practical Reason," nobly vindicating the claims of duty and religion, and forming a fitting corallary to the previous work, but inferior to it as a work of genius. In his system of morality he maintained the unconditional validity of the moral law, and the consequences which legitimately flow from it. He first proves that the concept of duty has an objective character, which is not possessed by any of the concepts of speculative reason. He then maintains that this concept of duty communicates immediately its objectivity to a second concept, that of liberty, which is so closely bound up with the first that they form together an inseparable whole. Duty and liberty become the pivots of man's conscious being; and his life is one of conflict between the impulse of free will to assert its liberty, and the impulse of conscience to insist on duty, as a curb. This conflict must cease; there must be some moral equilibrium between duty and liberty. Therefore, there is a future life and a God.

There is nothing really good in this world but a good will. A good will is the absolute scope and end of man. A good will is not estimated by its good effects, but must be good in itself. Temperance, fortitude, and like virtues aid and strengthen good will, but have no inward worth of their own. Good will has an inward, absolute, and necessary principle; this is the moral sense, product of pure reason.

Laws are either hypothetical or categorical: a hypothetical law is one which indicates a means to an end, but a categorical imperative is a law which is absolute. Moral laws are of this kind. "Let the maxim on which you act be fit for a law to all mankind"— this is Kant's famous rule of life.

His "Critique of Judgment" completed the critical philosophy, and of its merits Kant had the most superlative notions. He did not scruple to declare that, in his estimation, it satisfied the reason, and, for the highest aims of humanity, would be indispensable to all future ages! He had as confident a conviction of the permanence of his philosophy as Horace of the immortality of his *Odes*, and if he had modesty enough not to say so quite with the boastfulness of the Roman poet, he yet felt as surely as the latter in his inmost consciousness. That he was prophet as well as philosopher, the period from his death to the present is ample testimony.

The influence of Kant's speculations began to be felt at the same time that the French revolution was changing the face of Europe, and when old chaos seemed to have again revisited the earth. Materialism was predominant in France; in Scotland, Reid was combating scepticism on the principles of common sense; and an abstract dogmatism ruled the German mind. Here was a philosopher who, with unmatched analytic and synthetic powers, came forward to show to each previous and prevalent system its metes and bounds. Against the materialist and the sceptic, he proved that the mind had its *a priori* principles of knowledge; against the dogmatist, he maintained that the sphere of the supersensible, though a reality, is not disclosed to positive thought. He proved that empiricism is right so far as it asserts that the matter of our ideals is drawn from without, but wrong so far as it implies that their form can also there be found. And he is allied with the principle of the common-sense philosophy in ascribing an absolute validity to those moral ideas by which life is and must be guided. The utterances of this practical reason are true and valid, whatever may be the difficulties of the theoretical reason. We must live and act in view of God, freedom, and immortality.

His philosophy became the starting point for the most remarkable development of speculation since the days of the Greeks. German speculation was thoroughly quickened. Those who oppose Kant and those who espoused his views equally acknowledged his greatness. Reinhold at first defended and then modified his system. Schulze, Beck, and Bardili tried to bring it into more popular forms. Krug wrote a new *Organon*, and Fries a new "Criticism of the Reason." Hamann, Herder, and Jacobi developed their systems, which made faith the basis of philosophy, with constant reference to the principles of Kant. Herbart's positive philosophy claimed to have the true key to the Kantian metaphysics. Fichte unfolded his subjective idealism as the only logical result of the critical philosophy. And even in some of the latest products of German speculation there are not wanting attempts to show that Kant has not been superseded by any of his successors.

Although we live now at a distance of more than a century from the publication of Kant's great works, they are still growing in learned estimation, and it is probable that they are more appreciated at the present time than at any former period. De Quincey asserted that "measured by one test of power — namely, by the number of books written directly for or against himself, to say nothing of those which indirectly he has modified — there is no philosophic writer whatever, if we except Aristotle, Descartes, and Locke, who can pretend to approach Kant in the extent or in the depth of influence which he has exercised over the minds of men." Still more recently Dr. Hutchinson Stirling in his textbook says: "There can be no doubt that at this moment the place of Kant, as generally estimated, is that of greatest German philosopher, greatest modern philosopher, greatest philosopher of all, with only the usual exceptions of Plato and Aristotle."

1821	"Philosophy of Right,"	51
1829	Rector university of Berlin,	59
1831	Died at Berlin, Prussia,	61

GEORGE WILHELM FRIEDRICH HEGEL, one of the most eminent of German philosophers, was born at Stuttgart, Württemberg, August 27, 1770. He could trace his descent through a long line of Carinthian and Swabian ancestors who had filled respectable places in the middle ranks of society. Some of these during the period of the thirty years' war had suffered persecution and expatriation on account of their attachment to the Protestant cause. His father was superintendent of the ducal finances — a post, it may be supposed, of much trust and responsibility.

The Swabian temperament — characterized by gravity, straightforwardness, and perseverance — is said to have declared itself at a very early age in the life and conversation of the future philosopher. While still in his "teens" he went by the nickname of "the old man." His school and college diaries, extracts from which have been published by his biographer, Rosenkranz, attest the extent and variety of his studies. They afford evidence of indefatigable industry, of pains and thoroughness, rather than of precocity of genius. Method and persistency were the characteristics of the youthful scholar, as they were of the mature metaphysician.

At the university of Tübingen, to which he proceeded in 1788, he was a fellow student with the philosopher, Schelling — a kindred spirit, who presented, too, some very decided points of contrast. They lived together, for a time, in the same room; and the intimacy thus commenced exercised from first to last a marked influence, partly through sympathy, and partly through rivalry, on the destinies of these two great thinkers. In later life they had their differences. "They stood aloof, the scars remaining"; and so wide, indeed, was the breach that, after Hegel's death, Schelling was summoned to Berlin to preach down the doctrines of his early friend, which were supposed to have become too dominant and exclusive — an enterprise which he attempted without much success. But in those early days at Tübingen, in the springtime of their youth, the identity of their aspirations seems to have knit them together, as it afterward did at Jena, in the closest intellectual fellowship.

After completing his university course, Hegel accepted the office of tutor in a family in Switzerland, which he exchanged, some years afterward, for a more agreeable appointment of the same kind at Frankfort. For six years he gave his attention to his tutorial duties, to the study of the life of Jesus, the philosophy of religion, and ancient history. He read Thucydides, Montesquieu, Gibbon, Hume, and even wrote a "Life of Jesus," which, however, was never published. On the death of his father, in 1799, he received a small patrimony. In the year 1801 he proceeded to Jena, where he established himself on a more independent footing, and began lectures on philosophy at the university there as a privat-docent.

His friend Schelling, although some years his junior, had gotten the start of him, and was settled as a professor-extraordinary in the same place. Goethe, Schiller, and Wieland lived at Weimar, which was not far off, so that he was in contact with the most brilliant intellectual society which Germany at that time afforded. The genius of Schelling, as prolific as it was precocious, had by this time given to the world a series of profound philosophical disquisitions. At the age of nineteen he had shown a wonderful insight into the philosophy of Fichte, and had even carried it forward into a new development; and when Hegel now joined him he had just published his system of transcendental idealism.

Hegel made no pretensions to such pliancy of intellect and rapid power of composition; but he, too, was laying the foundations of a system which, although identical in its groundwork, or nearly so, with that of Schelling, was intended to be far more rigorous and logical in its procedure. It was, indeed, in their method that the main difference between the two philosophers lay. Schelling was of the opinion that the citadel of truth was to be carried by a *coup de main*, by a genial, "intellectual intuition." Hegel conceived that it was to be won only by slow sap and regular logical approaches. Accordingly, he published his first important work "On the Difference between the Philosophical Systems of Fichte and Schelling."

Hegel remained at Jena until 1807, and edited, along with Schelling, a journal of philosophy, besides delivering his lectures on philosophy. Schelling, however, migrated to Würzburg about 1803, and after three years Hegel was promoted to the chair which he had vacated. During his occupation of this chair, he completed the great work on "The Phenomenology of the Spirit"— *Die Phänomenologie des Geistes*—on the eve of the celebrated victory of Napoleon over the Prussians. But the emoluments of an extraordinary professorship being inadequate to support him during the excitement of war and conquest, he resigned the appointment and removed to Bamberg, where he acted for a short time as the editor of a political journal.

In 1808 Hegel was appointed to the office of rector of the gymnasium at Nuremberg. Here, in 1811, he married Marie von Tucher, a lady of strong religious convictions and moral virtues, to whom he was always devotedly attached. He remained at Nuremberg, giving elementary courses of instruction in philosophy and religion, and seeing the first two parts of his "Logic" through the press, until 1816, when he received a call to a philosophical professorship at the university of Heidelberg. At Heidelberg he remained two years, and completed his "Logic," under the title of the "Encyclopedia of the Philosophical Sciences" — *Encyklopädie der philosophischen Wissenschaften* — in which his entire scheme of philosophy is comprised. In 1818 he was summoned to fill the chair of philosophy in the university of Berlin, which had been vacant since the death of Fichte in 1814.

His fame now rose rapidly. His disciples began to be ardent and prophetic. His system was proclaimed as completing the structure of German idealism. His lectures soon became the rage. Officers of state and the *literati* and *savants* of Berlin sat on the students' benches. Hegelianism was the road to office. His previous lectures on the different branches of philosophy were carefully revised, and he wrote two new courses, on the "Philosophy of Religion" in 1821, and on the "Philosophy of History" in 1827. His "Outlines of the Philosophy of Right" was issued in 1821, combining in one exposition natural rights, ethics, and the philosophy of society and the state. The noted aphorism in which he summed up its teachings, "The rational is actual, and the actual is rational," was interpreted in an ultra-conservative sense. He was understood as supporting the existing Prussian political system as the perfection of reason and freedom.

His system received concentration and impulse from the establishment, with the favor of government, of the Berlin "Yearbook of Scientific Criticism" — *Jahrbücher für wissenschaftliche Kritik* — in 1827. All things were here discussed in the light of absolute knowledge. The school had solved the problem of the universe, and nothing remained but to bring all thoughts into subjection. The rationalists had no more violent foe than this prophet of the universal reason. He defended against them the truths of the incarnation of sin, and of redemption. The long conflict between philosophy and faith was now to be adjusted; the absolute idealism was to do it, and it was to be done in Berlin. In 1829 he became rector of the university, and administered its affairs with the punctuality and painstaking of an accomplished disciplinarian.

In the autumn of 1831 he began his lectures in the university with more than usual freshness and vigor, but died suddenly of cholera on November 14, 1831. The disease seems to have attacked his brain principally, and to have run a milder course than is usual with that formidable malady. The regulation which declared that all persons dying of cholera should be buried in a separate churchyard was relaxed, by high authority, in his favor. He was interred beside the grave of Fichte, in a churchyard near one of the principal gates of the city.

Thus, although the events of Hegel's life were simple and monotonous, the scene of his labors was not a little varied. Stuttgart, Tübingen, Jena, Bamberg, Nuremberg, Heidelberg, and Berlin were the stages in his pilgrimage. It was at these stopping places along the way that he taught and wrote; he evolved one of the most profound philosophical systems that the world has yet pondered.

Soon after Hegel's death an edition of his collected works was published by an association of his friends. This collection comprises his early philosophical treatises: "The Phenomenology of the Mind"; "Science of Logic" (metaphysical); "The Encyclopedia of Science" (embracing logic); "The Philosophy of Law"; "The Philosophy of History"; "Æsthetics"; "The Philosophy of Religion"; "The History of Philosophy"; and "Miscellaneous Writings" — in all, eighteen or more volumes; for some of them are divided into parts, each of which is again equal to a volume.

To give any minute account of the writings so multifarious is here quite out of the question. An outline of its groundwork and general scope is all that can be attempted.

His system, which is usually termed the "philosophy of the absolute," falls into three departments — logic, or the science of thought in its pure unity with itself; the philosophy of nature, in which the ideal principle is shown to underlie even the material world; and the philosophy of spirit. It properly begins with his "Phenomenology." This he used to call his "voyage of discovery," and its object is to describe the stages and process through which the mind must proceed from the simplest form of consciousness up to absolute knowledge; and to exhibit this, not merely as a matter of fact, but also as a logically necessary ascent. In his "Logic" he developed his system in its most rigorous and abstract form. This is designed to answer the question to which the "Phenomenology" led, viz.: What is that absolute knowledge which has been shown to be necessary? It is the completion of the system of categories, which Kant had elaborated, after Aristotle. It is not logic alone, nor metaphysics alone; it is both together. The terms logic, idea, and reason are used in an unusual, in a universal sense. The system of logic, as the first part of philosophy, contemplates reason (the idea) as it is in itself, and not in its manifestations. The whole science of logic is distributed into three parts — being, essence, and conception; the first two are the ontological logic, the third is the subjective logic. This logic forms the first great division of Hegel's whole scheme of philosophy.

Since this philosophy gives itself out as the philosophy of the absolute, the meaning of this word absolute, then, is what must, first of all, be determined. It is nowhere explained by the system, or by any of its opponents or defenders. It may, indeed, be said that Hegel's whole philosophy is nothing but an explanation of the absolute. But a definition of one word extending over a score of volumes is very apt to evaporate before it can be apprehended. The following is shorter. The absolute, or truth absolute, is whatever is true for intellect considered simply as intellect, and not considered as this or as that particular intellect; it is truth for *all* intellect, and not merely truth for *some* intellect; in other words, the absolute is truth for pure intellect, and not truth for modified intellect.

An illustration will help to make plain this somewhat abstract definition. Suppose five intellects, each of them modified by the possession of one, and only one, of our five senses. One man merely sees, another merely tastes, another merely smells, another merely hears, and another merely touches; and suppose an apple presented to these five individuals. Each of them would apprehend only *one sensation;* but while the *sensation* in each case would be different, the *one* in each case would not be different. The man who saw the apple would see *one* sight, the man who tasted it would experience *one* taste, the man who heard it (when struck) would hear *one* sound, and so in regard to the others. The sensations would be peculiar to each intellect; each would have its own; but the *one* would be common to them all — it would be the same for all.

Here, then, in the *one* we have an absolute truth, or at any rate a truth which may be accepted as an illustration of such. If there were no other intellects in the universe except these five, it would, in the strictest sense, be an absolute truth. Here the *one*, presenting nothing but what is common and intelligible to all, is to be regarded as a truth of intellect simply — of pure intellect: the *one sensation* again presenting, in each case, something which is peculiar to each intellect, is to be regarded as a truth of modified intellect. Looking at the five cases, we say that, in each case, the one sensation, in so far as it is *one*, is an absolute and universal truth; while, in so far as it is *sensation*, it is a relative and particular truth. Such is the explanation of the absolute; and it seems not unintelligible if one will keep in view the illustration by which it is enforced.

As a further illustration, this remark may be subjoined. Again consider these five sensations. Each of them is a peculiar sensation; but at the same time each of them *is*. In so far as each of them *is*, a truth for pure intellect, an absolute and universal truth, emerges. In so far as each of them is peculiar, a relative and particular truth is presented. Here, then, we have number and being, two important categories, set forth as specimens of the absolute.

The analysis thus briefly illustrated is the main principle of the German philosophy in general, and of the system of Hegel in particular. It is true that he nowhere expressly supplies this analysis, but it is implied in the whole tenor of his speculations. He rather proceeds prematurely to build up into a synthesis the elements of pure thought, which are the result of the analysis. Hence arises, in a great measure, his obscurity, which seems, in many places, to be absolutely impenetrable.

Nevertheless, in spite of all its defects, his exposition of the dialectual movement by which the categories of reason evolve themselves, from lowest to highest, through a self-conversion into their opposites, is a work replete at once with the profoundest truth, and the most marvelous speculative sagacity. Retrospectively, it affords a solution of the antinomies by which Kant succeeded in bewildering the reason of his contemporaries, and it extinguishes, by anticipation, the resurrection of these same sceptical perplexities which certain philosophers of the sensational school endeavored to bring about.

In "The Encyclopedia of the Philosophical Sciences," the categories worked out in the "Phenomenology" and "Logic" are applied to all the particular sciences. In his own terminology, "pure or absolute thought passes into something other than itself, exists out of itself in nature," and, accordingly, the philosophy of nature ranks as the second part of his system. In the philosophy of nature we have the same idea in its objective manifestation, in the forms of space and time. Nature is here reconstructed — or, Hegel would say, we see how it is constructed — according to the high *a priori* method, in its three departments of mechanics, physics, and organized beings. Each of these has, again, a threefold division; and these three yet other three; and this rhythm of triads makes the harmony of the system.

Returning again from its estrangement in nature, thought becomes conscious of itself in mind, and consequently the philosophy of mind or spirit forms the third part. Spirit here finds and knows itself, of course, in three stadia. In fine, spirit becomes absolute spirit, and as such shows itself in three modes, art, religion, and philosophy; and in the last the circle is completed, the end returns to the beginning, the absolute spirit knows itself, and the Hegelian system is all in all.

Hegel's "Philosophy of History," while it pursues his usual method, is much less abstruse than his logic and metaphysics, and may be studied with good hope of profit even by the unphilosophical mind. The unity of history and the filiation of succeeding generations is clearly and strongly grasped. When he tells us that reason is the substance and the infinite energy of the universe, we may decline to follow him into such fathomless depths; but when he presents his philosophy as a development of the view of Anaxagoras that mind governs the world, and further explains that in this he refers to no inscrutable providence, but to the informing idea, or, the abstract law, visible through the complications of history, we feel that we have reached firmer ground.

The object, Hegel goes on to explain, of the "Philosophy of History" is to present the series of human events as the embodiments of the informing idea. Slowly and step by step progress becomes more rational, conformity of fact to idea more complete. The path of progress is through the play of human passions: without passions nothing great is accomplished. "The passions of men are gratified: they develop themselves and their aims in accordance with their natural tendencies, and build up the edifice of human society; thus fortifying a position for right and order against themselves." The ultimate perfection of the state is when the consciousness of freedom is perfect; when the private interest of citizens coincides with that of the state.

Apart from the main peculiarity of his system, the impulse which this extraordinary thinker communicated to the various departments of philosophy was almost unexampled. He compelled men to think for him or against him. But the chief conflicts were in theology, and in the relations of his system to Christianity. Strauss ranged the school in three divisions, the right, the center, and the left. The right wing asserted that Hegelianism and orthodoxy were harmonious. On the left stood the radicals in religious opinion, who denied immortality, the divine personality, and the incarnation as specific in the person of Christ. The transformation of Hegelianism into naturalism by Feuerbach and others, and the direction taken by the development of the natural sciences have placed Hegel's philosophy in the heart of the materialistic controversies of recent times. Beyond Germany, Hegelianism is represented in France, in Italy, in Denmark, and in Sweden by numerous philosophers of note; and has also exerted an important influence on British and American thought, especially in the region of psychology.

Hegel's appearance and general characteristics as a lecturer are thus given by his leading biographer, Rosenkranz: "Utterly careless about the graces of rhetoric, thoroughly real and absorbed in the business of the moment, ever pressing forward, and often extremely dogmatic in his assertions, Hegel enchained his students by the intensity of his speculative power. His voice was in harmony with his eye. It was a great eye, but it looked inward; and the momentary glances which it threw outward seemed to issue from the very depths of idealism, and arrested the beholder like a spell. His accent was rather broad, and without sonorous ring; but through its apparent commonness there broke that lofty animation which the might of knowledge inspires, and which, in moments when the genius of humanity was adjuring the audience through his lips, left no hearer unmoved.

"In the sternness of his noble features there was something almost calculated to strike terror, had not the beholder been again propitiated by the gentleness and cordiality of the expression. A peculiar smile bore witness to the purest benevolence, but it was blended with something harsh, cutting, sorrowful, or rather ironical. His, in short, were the tragic lineaments of the philosopher, of the hero whose destiny it is to struggle with the riddle of the universe."

Professor Edward Caird, another of his biographers and interpreters, speaks thus of the moral influence of his philosophy: "As Socrates was compared to those figures of Silenus which were contained within the image of an Olympic god, so it may be said that in Hegel we find an idealist, for whom truth is poetry and religion one with philosophy, in the dress of a punctual and orderly civil servant of the Prussian government.

* * * * To him, therefore, the great aphorism, in which the Christian ethics and theology may be said to be summed up, that 'he that saveth his life shall lose it, and he that loseth his life shall find it,' is no mere epigrammatic saying, whose self-contradiction is not to be regarded too closely; it is rather the first distinct, though as yet undeveloped, expression of the exact truth as to the nature of the spirit."

HERBERT SPENCER, one of the most distinguished philosophers, and author of the *System of Synthetic Philosophy*, was born at Derby, England, April 27, 1820. His father was a teacher, with educational views considerably in advance of his time, and with strong leanings toward mathematics and the natural sciences. He believed in training the student's mind in observation and in reflection on objective facts instead of mere ideas. Both parents were originally Methodists in their religious affiliations, but his father latterly became a Quaker.

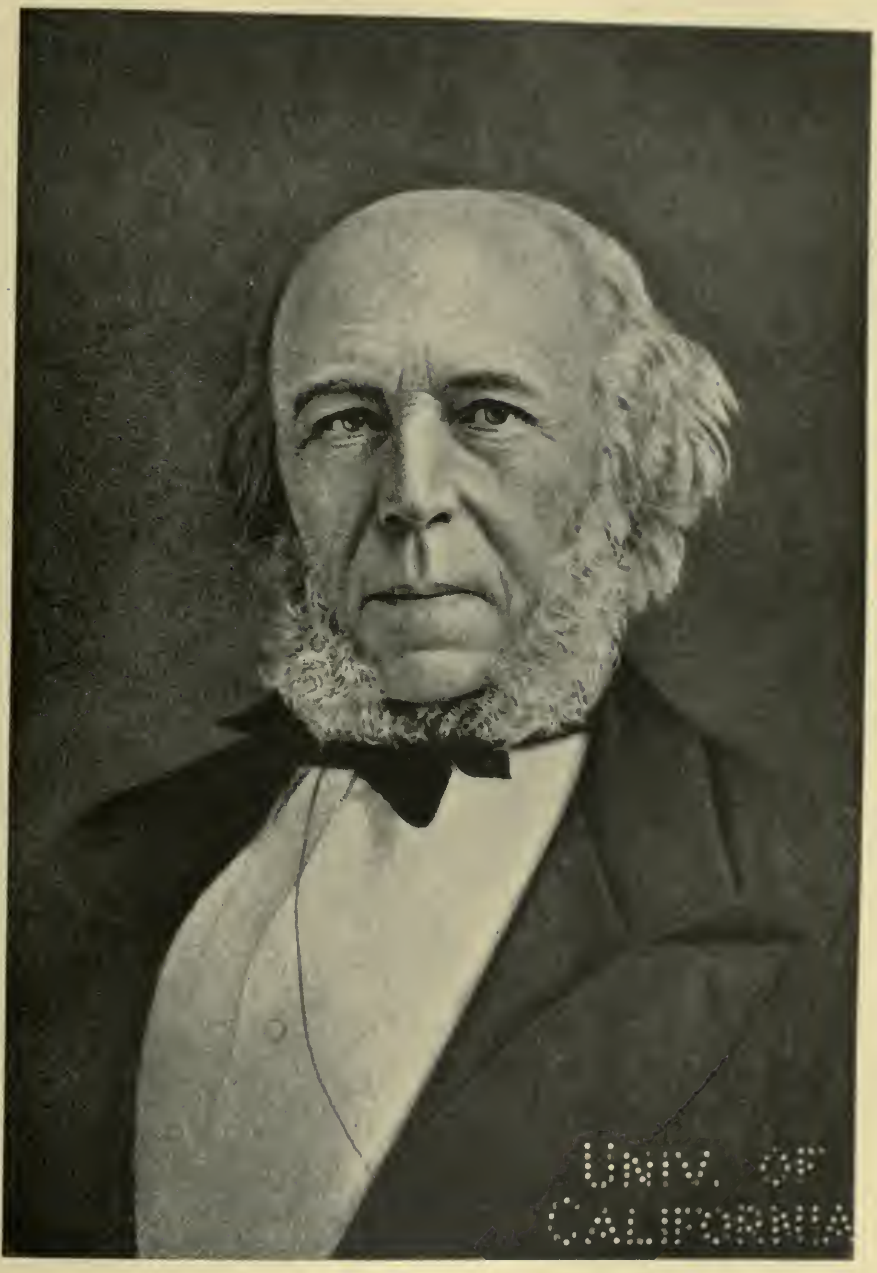
Herbert's health was delicate in childhood, and he was largely educated by his father at home with as much outdoor life as possible. A little later he was put in charge of his uncle, a clergyman of the church of England. He early showed a fondness for studies of nature, and for a good many years his favorite occupation was the catching and preserving of insects and the rearing of moths and butterflies. He also studied botany with some passion, and in these ways he laid the foundation for the scientific character and interest of his later work.

His uncle planned to send him to Cambridge university, but the boy "perseveringly objected," and continued to study privately. He had no aptitude for languages, and made little progress in the classics, but showed original constructive power in mathematics and mechanics. His mind rapidly developed marked independence, and, having yearly been brought into contact with the intellectual influences centering about John Stuart Mill, and with the scientific spirit, he imbibed the tendencies of the age toward extreme liberalism in theological matters.

At first it was his father's wish that he take up teaching, but an accidental opportunity decided in favor of another vocation more suitable to his tastes. In the autumn of 1837 work was offered to him under the chief engineer of the London and Birmingham railway, with whom he spent nearly a year. For some ten years more he engaged in engineering pursuits; and while still in the railway service — though a mere boy — he wrote some articles for *The Nonconformist* on *The Proper Sphere of Government*, in which he outlined the principles of non-interference which regulated all his thinking in later life.

When the railway mania finally subsided, Spençer, now twenty-six years of age, was left, like many other young men, without occupation. But the time spent at home while he was looking for something to do was not wasted. He had leisure for a good deal of miscellaneous reading. He studied Lyell's *Principles of Geology*, in which the doctrine of evolution was defended by Lamarck's doctrine as against creationism. About 1845 he found his way to London and soon obtained employment on *The Economist*, becoming its assistant editor in 1848. This position, which he held until 1853, gave him time for his studies, and made him acquainted with that brilliant coterie of thinkers, chief of which were George Henry Lewes, "George Eliot," and John Stuart Mill.

During his leisure hours he wrote the first work which brought him notice — *Social Statics* — published in 1850. This work was of a decidedly *a priori* character, and did not follow the inductive spirit of his later writings. It shows, however, his tendency to reconcile



UNIV. OF CALIFORNIA

HERBERT SPENCER
From a photograph

opposing influences and to discover closeness of relations where others did not suspect them. Subsequently, he became dissatisfied with both its views and its methods, and wished to recall it from circulation. This being found impossible, in later years he revised it by omitting what he had outgrown.

For eight years after leaving *The Economist*, Spencer pursued with eagerness the studies he had begun, and published in 1855 a work on psychology which he afterward revised and expanded into a part of his *Synthetic Philosophy*. Over-application brought on a serious attack of nervous prostration, which obliged him for the rest of his life to abridge his hours of study. He became a chronic sufferer from dyspepsia and insomnia, so that all his later work had to be done under these disadvantages. In the meantime he had conceived a system of philosophy which should embrace the general principles of all existing knowledge; he published a prospectus, or outline of it, indicating his intention to give twenty years to its development.

The first installments of the system did not meet with the reception he expected in Great Britain, and he feared he would have to abandon his undertaking. But the timely aid of his admirers in the United States, chief among whom was Youmans, editor of the *Popular Science Monthly*, enabled him to continue his work. His health, however, was so precarious that at one time he feared he would not live to complete the system. With this in view he suspended his labors on the main part of his work to write *The Data of Ethics*, which had been the object of the whole system, and in which it was intended to culminate.

Fortunately, through the utmost care, his life was prolonged far beyond all expectations. He was enabled to complete the system, and to revise an important portion of it in order to bring it up to date. It consists of the following parts written or published at or within the dates indicated: *First Principles*, 1862; *Principles of Biology*, 1863–67; *Principles of Psychology*, revised, 1871-72; *Principles of Sociology*, 1876–96; *Principles of Ethics*, 1879–93. He also wrote three volumes of *Essays: Scientific, Political*, and *Speculative*, between 1858 and 1863, and the small but exceedingly popular work on *Education*. In 1894 and 1895, respectively, appeared two important essays on the theories of the German scientist, Weismann, and a number of other fugitive articles and addresses have found their way into his complete works. In 1882 Spencer made a visit to the United States and lectured before a number of academic and scientific societies and institutions.

It is doubtful whether the works of any other philosopher have been more widely translated than those of Spencer. They are known and studied in all the European languages, as well as in several oriental languages. In Japan and India, particularly, they have received a high place, and seem to have met there the peculiar needs of the speculative mind with greater success than any other system.

In the later years of his life Spencer was almost wholly occupied with his *Autobiography*, which has recently been published and forms a most impressive commentary on contemporary thought and thinkers, as well as many introspective glances into the life of this remarkable man. He died at Brighton, England, on December 8, 1903.

The story of Spencer's life is neither eventful nor picturesque, but it commands the interest of all who admire faith, courage, and loyalty to an ideal. It is the record of plain living and high thinking of one who, though vexed by an extremely nervous temperament, was as resolute as a Hebrew prophet in delivering his message. In it we see a quiet servant of science, indifferent to conventional honors, careless about "getting on," disliking controversy, sensationalism, and noise, trusting to the power of truth alone, that it must prevail.

Spencer's personality, according to W. H. Hudson, one of his students, rarely made a favorable impression upon strangers. This was due, in part, to the difficulty which many seem to have experienced in getting into touch with him under the conditions of casual intercourse. He was a reserved man; his manner, save toward personal friends, was habitually cold and distant; there was nothing about him to set the chance comer — especially if he happened to be of the all too common lion-hunting order — at his ease. And even his friends had to make occasional and sometimes large allowance for the irritability which was an inevitable result of constant insomnia, dyspepsia, and nervous prostration.

His heroic struggle to fulfill the purpose of his life told in many ways upon him, for it involved sacrifices, which in turn brought about some narrowing of personal interests and sympathies; while the fact that he never married, and lost most of his immediate relatives early in life, undoubtedly led him to dwell overmuch within himself. But to emphasize a certain austerity which marked him in his more formal associations, without at once adding that this was in reality only the superficial aspect of a singularly strong, upright, and noble nature, would be to give an altogether false idea of the man.

Continuing, Hudson observes, "Absolute rectitude seems to me to have been the keynote of his character. Throughout his life, in small things as in great, he governed his conduct according to the most stringent principles of justice and right; and if his severe sense of what was due from others made him occasionally seem over-exacting — if in his judgments of men's motives and actions he might sometimes appear to take ordinary human weakness too little into account, he at all events claimed from other people not a whit more than he demanded of himself. And of the rest, if I may draw upon the memory of my own long relationship with him, he was a man whom intellectually and morally one might admire at a distance, but whom one grew to revere and love as one came to know more and more of him. The real emotional richness of his nature, his transparent simplicity and freshness, the depth of his sympathy and kindness, were not opened to the general world, and revealed themselves only at close touch.

"For all his reserve, for all his hatred of publicity, he was not by temperament a recluse. Ill health and the urgent need of economizing his strength alone kept him out of many social activities he would otherwise have enjoyed. As it was, he was devoted to his friends; was fond of the genial intercourse of the dinner table; and delighted in story and repartee. For a good many years, until, indeed, his nervous trouble assumed its more serious form, when he was well on toward seventy, he was a regular *habitué* of the Athenæum club, where he played a capital game of billiards. Though always a rather impatient reader of general literature, he was a passionate lover of music, which, during the years when I saw most of him, seemed to yield him his greatest solace and pleasure." So much for Spencer's personality; now, a brief look at his intellectual achievements.

By a happy accident Spencer began his career at a time when the great theory of evolution was being propounded, and a new world seemed to open for scientific discovery. With the enthusiasm of youth he set himself to map out this new world, and with a rare fidelity he continued his labors unremittingly to the end of a long life. To unite science and abstract thought, to deduce from the isolated discoveries of departmental science a guiding principle, and to work out this principle in every domain of human activity was the task he set for himself.

From the beginning of his philosophical career Spencer surveyed all fields of physical theory and of biological investigation, and all psychological, sociological, and moral problems. His first important pamphlet, *The Proper Sphere of Government*, soon expanded into the radical volume *Social Statics*, offered a carefully constructed theory of human happiness. The first edition of *Principles of Psychology*, published four years before Darwin's *Origin of Species* appeared, clearly presented a conception of life and of mind as a continuing adaptation of organic and nervous changes to environing conditions, and outlined the hypothesis of evolution in most of its essential features. The essays that followed, including the famous papers on *Progress: Its Law and Cause*, and *The Social Organism*, contained in brief and striking presentation the substance of the doctrine afterward systematically set forth in exhaustive detail in the ten large volumes of the *Synthetic Philosophy*.

Spencer's philosophy is, in a word, the philosophy of evolution; its object is to exhibit the life history of the world as a complex result of a universal process, the fundamental laws of which are first established and traced down to their ultimate explanation in terms of the constant and necessary redistribution of matter and notion. In other words, beginning with the first principles of all knowledge, he proposed to trace how the law of evolution was realized in life, mind, society, and morality. The truth of all organic development — or the law of evolution — he defines as a change from a state of homogeneity to a state of heterogeneity, and this is regarded as the organizing principle of his entire system. This, and other universal truths, is developed in his *First Principles* inductively and deductively, and used as the basis for a complete unification of knowledge. The ultimate test of truth is the inconceivability of the negation by the individual thinker; the "relativity of knowledge" is much insisted on.

This done, he had then to carry such universal truths forward into the particular phenomena of life and mind, society, and morality; two volumes on biology, two on psychology, three on sociology, and two on ethics, embracing the entire scheme. Assisted by elaborate ethnographical charts (*Descriptive Sociology*) he attempted to trace the development of human ideas, customs, ceremonial usages, and political institutions. The genesis of religion is traced generally to ancestor worship. Ethics has its root in physical, biological, psychological, and social phenomena; the best conduct is that which most fully realizes evolution.

How much or how little of this vast edifice is likely to stand the test of time and criticism is a question that the future alone can answer. Merely to have created so huge a structure is a claim to immortality, for though every axiom and conclusion were denied, later generations might well wonder at the vitality which could carry one thinker through so many arduous paths. Every system of philosophy, or of science, must be judged on the qualitative as well as the quantitative side; it must not only be complete, it must be true. A laborious industry in collecting facts will not avail if the basis of the synthesis is false or inadequate. It is Spencer's chief claim on the attention of posterity that he built broad his foundations on the organic unity of the world.

Of no modern thinker, perhaps, have so many or so varied estimates been offered to the world as of Spencer. By his adversaries he has been pictured as an arch-heretic, one of the flowers of nonconformity, against theology and against metaphysics, against monarchy and against molly-coddling legislation, against classical education and against socialism, against war and against Weismann. So that it would be difficult to select the man who has not some crow to pick with Spencer.

It is not to be wondered at, then, that we find extraordinary difference of opinion as to the value of the great dissenter's deliverances. By his disciples he has been described as the greatest intellect since Aristotle. By his traducers he has been characterized as a purveyor of pretentious explanations of the universe that already have passed into the shadow world of bygone philosophies. One class of readers has found his pages charged with inspiration; another class has resented his orderly exposition as mechanical and repellent. His very personality, as revealed in his philosophical system, has been conceived by some among his critics as commonplace, unrelieved by any touch of genial sympathy or illuminating humor; and by others as heroic in its straightforward devotion to one single aim.

These are the extremes of estimate. Between them lies every imaginable shade of superficial impression and of critical appreciation. However, no human being of two generations, intelligent enough to know anything of the great issues of modern thought, has been wholly unmoved by the magnitude and power of this commanding mind. He was probably one of the most learned men of our day, a great polymath, whose encyclopedic learning may justly entitle him to rank with those other synthetic philosophers, Aristotle and Bacon. If in his desire for a complete system of thought there is a suggestion of the German metaphysician, in most respects he was a typical English philosopher. The gravity and moderation of his argumentative methods, his high character, his fidelity to his enormous self-imposed task, were all influences of the highest value in a world which is becoming daily more disposed to judge men and things from a low material standpoint, and look askance at the self-sacrificing life of the thinker and scholar.

Few men have ever more completely dominated contemporary thought than Spencer. He made popular the greatest of modern scientific truths. The wide knowledge of physical science, which all his writings display, and his constant endeavor to illustrate and support his system by connecting his positions with scientific facts and laws have given his philosophy great currency among men of science. The impulse given by him, also, to workers in almost every field of thought and investigation testifies to the immense range and rare originality of his genius; and his *Synthetic Philosophy* itself, no matter in what way it may hereafter be modified or outgrown, will unquestionably be regarded by future generations not only as one of the grandest achievements of the century which brought it to birth, but also as a permanent landmark in the history of civilization.

1465	Ennobled by Adolph of Nassau,	65
1468	Died at Mainz,	68

JOHANNES GUTENBERG, the inventor of printing from movable types, was born at Mainz, Germany, of noble lineage, about the year 1400. Recent investigations tend to show that his true name was HANS GANZFLEISCH DE SULGELOCK, and that he assumed the name of his mother's family, Gutenberg, on account of some political troubles that existed at the time, as well as some defects which existed in the feudal title to the family property. It seems probable that he devoted himself at an early age to mechanical arts; and that about 1420, when the disturbance at Mainz occurred, immediately succeeding the entrance of the emperor Frederick III., the young mechanician, as well as his family, was forced to quit his native city. It is generally believed that he went immediately to Strassburg; at least he was in that city in 1434.

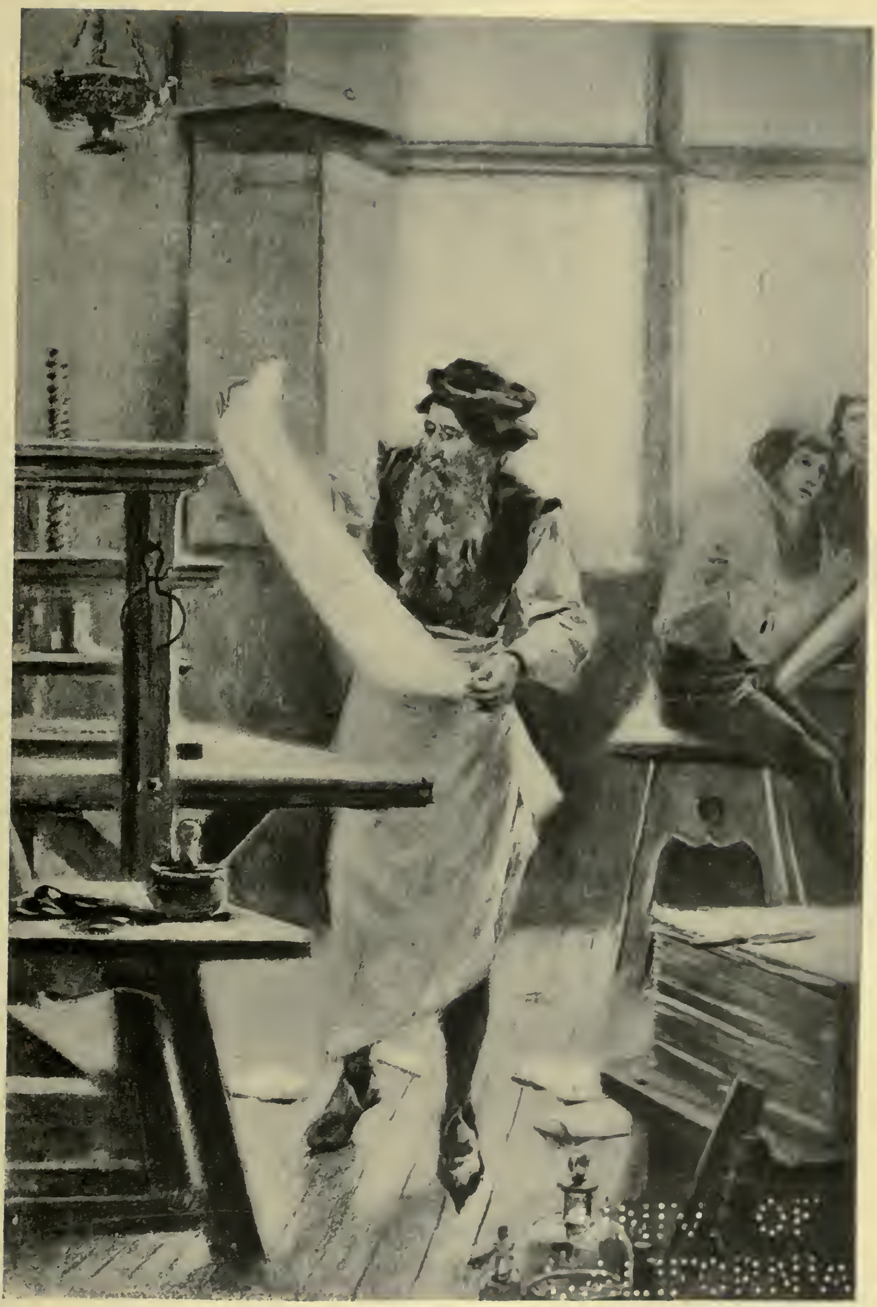
Two years later he formed a partnership with Andrew Dritzehn, in the business of polishing stones and manufacturing mirrors. Subsequently, he formed another partnership with Dritzehn and others "for the working out of certain secret processes invented by him," by which he bound himself to instruct them in all the "secret and wonderful arts," and to employ these for their common advantage. His associates, it appears, were of noble birth, like himself, and the fact that they had compromised their social position by entering into industrial pursuits was at that time viewed with considerable suspicion. The "secret processes," undoubtedly, comprehended the first steps in the art of printing.

In the abandoned convent of St. Arbogaste the first attempt had been made, and the works had been executed with the greatest secrecy. There is a mention in the written agreement of "materials and utensils, of lead, of a press, of a vise for holding the parts together," etc., and that the work should be ready for the coming fair at Aix-la-Chapelle. The wording is anything but clear, the aim seeming to be to avoid revealing to the public anything of which it ought to remain ignorant. At that epoch all industry surrounded itself with secrecy.

In 1439 the death of Andrew Dritzehn involved Gutenberg in a lawsuit with the former's brother, George. The suit was decided against Gutenberg, and the papers in it, which are now carefully preserved in Strassburg, form the earliest documents relative to the printer's art.

About 1446 he returned to Mainz, and permanently located there. The great expense involved in his undertakings had consumed all his means, and in 1450 he formed a new partnership with a rich goldsmith, Fust, for the further exploitation of his admirable invention, and acquainted him with the results already obtained. Fust made the necessary advances, but later on introduced a third, Schoeffer, as partner or employee, and took such guarantees for the money advanced that five years after he was able to break the connection by demanding a reimbursement from Gutenberg. The latter, unable to satisfy his demands, was forced to hand over to him his apparatus and nearly all his stock.

After the first break in the partnership, Fust and Schoeffer continued to print, and Gutenberg, on his side, succeeded in again establishing himself in the same city, where, with the assistance of Conrad Humery, a



GUTENBERG
From the painting by Ferris

councilor of Mainz, he brought out the first printed Bible, the famous Bible of thirty-six lines, begun long before with other partners at Strassburg. According to some, four editions of the *Donatus* were likewise printed by Gutenberg, while others ascribe them to Fust and Schoeffer. In 1457 appeared the Latin *Psalterium*, or rather a breviary containing psalms, with antiphones, collects, etc., and arranged for choruses for Sundays and holidays.

This specimen of the art of printing, remarkable as being the first bearing the name of the printer and the locality, as well as the year and day of its completion, and valued at fifty thousand pounds, was printed with an elegance which sufficiently proves the rapid progress that had been made in the newly invented art, and the diligence with which it had been presented. Gutenberg's printing establishment existed until 1465 in Mainz.

His last years were passed obscurely in the midst of hard work, and unhappily in the embarrassments of poverty. In 1465 Adolph of Nassau, elector of Mainz, named him one of his courtiers and raised him to the rank of a noble. Three years after this occurred his death in 1468. Nothing is known of his private life. That he married appears from the fact, that, in 1437, a complaint was entered against him at Strassburg by a lady of rank, claiming the fulfillment of a promise of marriage, and later her name is identified with his in the register.

The obscurity which envelops the early epoch of the history of printing is rendered more cloudy still by the precautions which the inventor and his partners were obliged to take to conceal their proceedings. The books printed by them were done with such rapidity — for those times — that their work gave rise to grave suspicions among the authorities. It was ascribed to magic, and Mephistopheles, rather than either Gutenberg or Fust, got the credit of the invention.

Printing from engraved wooden blocks had been in use for more than half a century, especially in Germany and the low countries. It was employed in connection with pictorial engraving to explain such series of pictures as the "Dance of Death," "Biblia Pauperum," etc., but was obviously inapplicable to works of considerable length.

The expedient of making the types for each letter movable may be compared both for ingenuity and for momentous results with the Phœnician invention of the alphabet as contrasted with ideographic writing. The authorship of this expedient, while at one time vehemently debated, is now almost universally ascribed to Gutenberg. The story that gave currency to most of the debate on this matter is that, in 1445, a short Latin grammar of Ælius Donatus, and the *Speculum humanæ salvationis*, were printed in Haarlem with movable types by Lourens Janszoon Coster, and that shortly afterward a servant of Coster stole these types and took them to Mainz, where they came into the possession of Gutenberg.

The evidence in favor of Gutenberg's being the inventor of printing is considered by his countrymen quite conclusive. They adduce the testimony of Ulrich Zell of Hanau, who first introduced the art into Cologne, and who declares that "this noble art was invented for the first time in Germany, at Mainz, upon the Rhine, by a citizen of Mainz, named John Gutenberg." Similarly speaks Wimpfeling, a learned Alsacian, born at Strassburg in 1451, and partly contemporaneous with Gutenberg. "In the year 1440, under the reign of Frederick III., an almost divine benefit was conferred on mankind by John Gutenberg, who first discovered the art of printing." So, too, says Trithemius (born 1462, died 1516): "At this epoch, this memorable art of printing was devised and invented by Gutenberg, a citizen of Mainz"; while Johann Schoeffer, son of Peter Schoeffer, the partner of Fust, in his preface to a German translation of Livy in 1505, expressly affirms that "at Mainz originally the admirable art of printing was invented particularly by the ingenious Johann Gutenberg, 1450 A. D.," and that it was "subsequently improved and propagated to posterity by the wealth and labors of Johann Fust and Peter Schoeffer." That Gutenberg may have received the first hints of his invention from the Dutch xylography is not denied. Ulrich Zell himself admits this; but the invention of typography, and beyond all doubt of the printing press, must be ascribed to the German.

Still greater uncertainty exists regarding the steps by which Gutenberg arrived at his invention. According to Didot, Gutenberg, in his work, probably traversed the following phases: (1) The engraving of movable letters, first in wood, then in lead, and the adjusting more or less regularly these letters for the impression. (2) The casting of the letters, clay, lead, or tin, by means of moulds in sand. (3) The retouching of these characters after the casting. (4) The engraving of the letters on soft steel, tempering it afterward, and striking these letters in matrices of copper. (5) Moulds, of which the mechanism was probably at first similar to that the ancients employed in making medallions, and which were afterward perfected by Schoeffer. (6) The composition of a siccative ink, and the preparation of leather pads by which to extend the ink over the characters. (7) The press, chief of all, the embodiment of the whole process, of which it terminated the different operations.

Within sixteen years from the date of the first printed Bible, the art of printing was practiced in the principal cities of Germany and Italy. Strassburg was the first after Mainz to adopt the process. In 1466 we find it at Cologne, in the following year at Rome. By 1471 it was established in Venice, Florence, Naples, Bologna, and Milan. England, still involved in the wars of the roses, was late in the race. The date of the first English printed book is 1477, while that of the first book printed in America is 1640.

The effect of printing was to establish the continuity of the western world with Greco-Roman traditions, and this with the previous life of humanity, which the rise and progress of the mediæval church had for centuries disturbed. The expression "humane letters" — *litteræ humanores* — represents accurately what took place. The thoughts of men to whom man's life and man's world were the things best worth living for, and who revered the Roman state as the best security for peaceful progress — men like Cicero and Vergil, and with them all the poets, historians, and thinkers of Greece and Rome — became henceforth familiar household words. This at least was the case with a large and powerful section of society. Those to whom Greek and Latin books still remained sealed were at least made familiar in translations of the Bible with the sources of their own religion: with what momentous results the history of the next two centuries was to show. To mediæval theology the invention of printing dealt as powerful a blow as the feudal system received from the invention of gunpowder, rendering the costly armor of the privileged classes useless in battle.

Rightly, therefore, does this invention take precedence of other forms of modern industry. Lamartine said that with his invention of printing Gutenberg had given the world a soul. In the long run the world is governed by ideas, material force being needed only to maintain order until ideas have taken hold of men and rendered them self-governing. The machine that disseminates thought is, therefore, the greatest of machines. Like all other forces, the power it wields has been and will be misused. But it offers the means whereby the masses of citizens can participate actively or passively in the acts of the state of which they are members. And its right use in the end predominates over the wrong.

"The multiplication of readers," says Victor Hugo, "is the multiplication of loaves. On the day when Christ created that symbol, he caught a glimpse of printing. His miracle is this marvel. Behold a book. I will nourish with it five thousand souls, a hundred thousand souls — a million souls — all humanity. In the action of Christ bringing forth the loaves, there is Gutenberg bringing forth books. One sower heralds the other. * * Gutenberg in the fifteenth century emerges from the awful obscurity, bringing out of the darkness that ransomed captive, the human mind. Gutenberg is forever the auxiliary of life; he is the permanent fellow workman in the great work of civilization. Nothing is done without him. He has marked the transition of the man-slave to the freeman. Try to deprive civilization of him, you become Egypt. The decrease of the liberty of the press is enough to diminish the stature of a people. * * * * A Gutenberg discovering the method for the sowing of civilization and the means for the ubiquity of thought will be followed by a Christopher Columbus discovering a new field. A Christopher Columbus discovering a world will be followed by a Luther discovering a liberty. After Luther, innovator in the dogma, will come Shakespeare, innovator in art. One genius completes the other."

Again, Carlyle says: "When Tamerlane had finished building his pyramid of seventy thousand human skulls, and was seen 'standing at the gate of Damascus, glittering in steel, with his battle-axe on his shoulder,' till his fierce hosts filed out to new victories and new courage, the pale onlooker might have fancied that nature was in her death throes, for havoc and despair had taken possession of the earth, the sun of manhood seemed setting in seas of blood. Yet it might be, on that very gala day of Tamerlane, a little boy was playing ninepins on the streets of Mainz, whose history was more important to men than twenty Tamerlanes. The Tartar Khan, with his shaggy demons of the wilderness, 'passed away like a whirlwind' to be forgotten forever; and that German artisan has wrought a benefit which is yet immeasurably expanding itself, and will continue to expand itself through all countries and through all times. What are the conquests and expeditions of the whole corporation of captains, from Walter the Penniless to Napoleon Bonaparte, compared with these 'movable types' of Johannes Gutenberg?"

COLUMBUS

A. D.		AGE
1446?	Born at Genoa, Italy,	..
1460	First went to sea,	14
1470	Settled in Lisbon; married,	24
1474	Corresponded with Toscanelli,	28
1477	Sailed beyond Iceland,	31
1490	His scheme of discovery unfavorably reported by committee,	44
1492	Sailed westward; reached San Salvador,	46
1493	Embarked on second voyage from Cadiz,	47
1496	Returned to Spain,	50
1498	Third voyage,	52
1500	Returned to Spain in chains,	54
1502	Fourth voyage,	56
1506	Died at Valladolid, Spain,	60

CHRISTOPHER COLUMBUS, the most famous of navigators and geographical discoverers, and thereby one of the greatest benefactors of the world, was born at Genoa, Italy, about 1446. Though virtually the greatest man of his era, there is little definite information about his family and his early life.

It appears, however, that his father was a wool weaver or a wool carder in Genoa. Christopher had two brothers, both associated subsequently with his fortunes, and both known to have been well-educated men. Columbus himself was, for a time at least, at the university of Pavia, and in his later years he looked fondly back to his early studies of "cosmography, history, philosophy, and other sciences." At fourteen he took to the sea. "At a very tender age," he wrote in 1501, "I took to navigation, and have continued it ever since: an art which fills whosoever follows it with a desire to know the secrets of the world; and these forty years past have I been familiar with every place to which men sail to-day."

The Italian mariner of those days was by necessity a fighting man. The Mediterranean swarmed with pirates, Mohammedan and Christian. The maritime states of Italy, like the others, were perpetually at war, and privateering was a recognized profession, and an important matter of resource of the high as well as of the low.

From this wild school of the Mediterranean, voyaging and battling, Columbus emerged to find for a time a more peaceful and tranquil existence on land. About 1470 he settled at Lisbon, Spain, and there married the daughter of an Italian named Perestrello, who had distinguished himself as a navigator in the Portuguese service. His wife — Donna Felipa Moniz de Perestrello — was not rich, but she brought him a valuable dower of geographical knowledge and stimulus. Lisbon, at this time, under Prince Henry IV. of Portugal, was the headquarters of all that was speculative and adventurous in the way of geographical discovery. Donna Felipa's father had been governor of Porto Santo, an island recently discovered in the very neighborhood of Madeira. Her sister was married to another ex-governor of Porto Santo. The newly wedded pair resided with the mother of Donna Felipa. The charts, papers, and memoranda of his wife's father were placed in the hands of Columbus, and with the conversation of his brother-in-law excited him in the direction of new geographical discovery.

When in Lisbon he devoted himself to the construction of maps and charts for a livelihood, and his mind began to compare the known of the earth's surface with the unknown. For a time he resided at Porto Santo, where his wife had a small property, and voyagers from the Guinea coast were in the habit of touching. Sometimes he took part in expeditions to the coast of Guinea. His greatest adventure of those years, however, was a voyage to the northern ocean beyond Iceland in February of 1477.

The earliest trace of Columbus' great design belongs to the year 1474, a year otherwise memorable for the introduction of printing into England. In that year we find him corresponding with Paolo Toscanelli of Florence, on the feasibility of a western passage, not to America, but to Asia. The learned Toscanelli approved of the design, and sent Columbus a chart of his own construction, in which the eastern coast of Asia was represented as moderately distant from the western coasts of Africa and Europe, and in the intervening ocean stood Marco Polo's Cipango — Japan — and the imaginary island of Antilia, still recognizable in the Antilles. This map, or some redaction of it, Columbus had with him on his first voyage to America. For his knowledge of the general literature of the subject Columbus was chiefly indebted to the *Imago Mundi*, a cosmographical compilation of Cardinal Pierre d'Ailly, bishop of Cambray, written in 1410, and printed, probably, about 1490. Here he found, collected, the dim guesses of ancients and moderns at the true figure of the earth, and the possibility of sailing from west to east. This was the book that furnished him with weapons for his frequent controversies subsequently with the learned sceptics of Spain and Portugal.

But it was not only from fanciful charts and the theorizings of scholars, old and new, that Columbus derived his faith in the existence of easily accessible regions to the west. Eagerly he inquired from practical men respecting vestiges of a world beyond the western wave. By two happy mistakes he diminished the circumference of the earth, and gave a vast imaginary extension to Asia. It grew to be for his mind no mere matter of speculation, but an indubitable fact, that the eastern shore of Asia, and the magnificent civilization described by Marco Polo could be attained by a moderate voyage westward from Europe; and the belief that he had reached Asia, not that he had discovered a new continent, remained with him to his dying day.

The highest religious aspirations, and the intensest worldly desires of Columbus gradually ranged themselves round this central faith. He saw immense authority and illimitable wealth, the reward of his achieved discovery; but all earthly gains were subordinated to the triumphs of the cross among new and vast populations. The certain wealth to be acquired by himself should be devoted — such was one of his dreams a few years further on — to another crusade, and to the recovery of the holy sepulchre from the hands of the infidels, with whom he had already battled in his early and obscure years of Mediterranean voyaging.

In 1481 John II. ascended the throne of Portugal. It was shortly after the accession of this monarch that Columbus — after having, it is said, vainly applied to Genoa — propounded to him the daring scheme of reaching India by the western ocean. Preoccupied, probably, by the idea of the southeastern route, John at first discouraged the new enterprise, but eventually referred it to a junto composed of his two physicians and his confessor, the bishop of Ceuta. By them the notion was condemned as chimerical, a verdict which was ratified by a great council of civil and ecclesiastical dignitaries and learned men, whom the hesitating king constituted a court of appeal. The king still hesitated, when an ignoble compromise was offered to him and accepted.

Under pretense of a wish to thoroughly examine them, the detailed plans of Columbus were procured from him. Unknown to him, a caravel was despatched westward on a voyage of discovery. After a few days stormy weather frightened the conductors of the expedition back to Lisbon, where they ridiculed the aim of Columbus. Indignant at this treachery, Columbus declined any further negotiations with John II., and shook the dust of Portugal from off his feet. He left Portugal, it is believed, not only poor, but in debt. His wife was dead, and he took with him his little motherless Diego, who lived to be a second admiral of the Indies. It is supposed that he now applied a second time to Genoa to aid him in his enterprise, and that during his visit to his native city, he assisted, out of his own scanty means, his aged father, whom he had already helped while struggling for a subsistence as a chartographer in Portugal. A deep affectionateness of disposition is one of the most noted of Columbus' characteristics.

It is in 1485, and in the south of Spain, that we next see Columbus distinctly. Great dukes of Medina Sidonia and Medina Celi, with estates and ports upon the seaboard, gave an attentive ear to his glowing projects; but his only direct gain from them was a recommendation to Queen Isabella of Spain. The astute Ferdinand and the noble-minded Isabella were then occupied with their campaigns against the Moors. At intervals they entertained the schemes of Columbus so far as to have him a frequent visitor of their camp, and to relegate his enterprise to the discussion of eminent men.

From Cordova, Columbus followed the court to Salamanca in 1486, by order of King Ferdinand, and there he held a solemn conference with a junto, chiefly composed of learned and scientific ecclesiastics. At the epoch of this discussion, Copernicus was a boy of thirteen, and Columbus was met with quotations from the Bible and the fathers against the rotundity of the earth. The conference was adjourned without definite result.

From 1487 to 1490 Columbus hung about the Spanish court and camp, now stoutly fighting against the Moors, and summoned to consultations with the Spanish sovereigns, sometimes full of hope, sometimes so discouraged as to think of renewing negotiations with John of Portugal, or of repairing to London and Henry VII. At last, in the summer of 1490, he pressed with such earnestness for a distinct reply to his application that the old conference was ordered to give him one. Its members reported against him; and the curtain drops for a time on Columbus, the dejected and disappointed, poor and isolated, beginning once more his weary pilgrimage.

When the curtain rises again, it is to discover Columbus approaching the gate of the convent of Santa Maria de Rabida, near the haven of Palos in Andalusia, for the purpose of procuring a crust of bread and a draught of water for the little boy by whom he was accompanied. The prior of the convent, passing at the moment, observed that he was a foreigner, entered into conversation with him, and learned who he was.

This interview with the prior of the convent of Rabida, Juan Perez de Marchena, was the turning point in the career of Columbus. The prior was a man of sense, and he had been the queen's confessor. He talked with Columbus, and was so struck with the grandeur of his views that he introduced him to the notables of the neighborhood, among others to Martin Alonzo Pinzon, the head of a flourishing family of navigators in the thriving and adventurous port of Palos. Pinzon was convinced, and offered his coöperation, personal and pecuniary. The prior, presuming on his old connection, wrote fervently to the queen for a decisive encouragement to Columbus, who spoke of carrying his projects to the court of France, whither, it is said, Charles VII. had invited him.

Isabella, perhaps alarmed lest another country should profit by Columbus' discoveries, sent for both Columbus and the prior, and with womanly thoughtfulness transmitted a considerable sum of money wherewith the impoverished adventurer might properly array himself for appearance at court. He arrived in time to witness the surrender of Granada, and in the glories of the triumph did not grudge a little delay. At last he was heard once more; but, at the very threshold of the negotiations, the lofty and unbending pride of Columbus proved almost suicidal. He insisted on high titles and privileges; he was to be admiral and viceroy of all the countries discovered; and one-tenth of all gains derived from commerce or from conquest were to be his. The courtiers laughed. The official person who more directly treated with him was the queen's confessor, the new archbishop of Granada, and he professed himself shocked at the claims of the humble projector. Even Queen Isabella wavered. It shows the genuine confidence which Columbus had in himself and in his mission, that, at this apparent crisis of his fate, he refused to give way.

At the commencement of February, 1492, he mounted his mule and set forth for Cordova on the road to France. Once again Queen Isabella was strenuously appealed to by an official believer in Columbus, and once again she summoned him to her presence. When he reached the court again, he found his demands conceded. On a former occasion, during his negotiations with Pinzon, Columbus had, when twitted with his poverty, offered to bear one-eighth of the expense of his proposed expedition. This same condition was embodied in the so-called "capitulations," signed by Ferdinand and Isabella on the 17th of April, 1492; and with the aid of the Pinzons of Palos a third vessel was added to the expedition, nominally at the expense of Columbus.

The port of Palos, the headquarters of the Pinzons, was fixed on by Columbus as that of equipment and embarkation. Toward the beginning of August, 1492, the squadron was ready for sea. It was, for the magnitude of the enterprise, on a wonderfully small scale, and consisted of three little vessels. Two of them were of the class called "caravels" — light vessels, somewhat like the ordinary masted schooner used in coasting trade —

built high at prow and stern, with forecastles and cabins for the crew, but without decks. One of these, the *Pinta*, was commanded by Martin Alonzo Pinzon and his brother; the other, the *Nina*, with lateen sails, was commanded by the third of the brothers Pinzon. The largest, prepared expressly for the voyage and decked, was the *Santa Maria*, and this was the admiral's ship. The exact tonnage of the vessels cannot be ascertained, but Columbus, in a subsequent voyage, is known to have complained of the undue size of his ship, which was nearly a hundred tons burden.

In such craft did the brave voyager and his friends face the mysterious terrors of the unknown Atlantic. Amid the doubts and fears of those on shore, with prayers to heaven for mercy and guidance, the expedition set sail from the sandbar of Sultes — near the confluence of the Tinto and Odiel, rivers of Palos and Huelva — on the morning of Friday, the 3d of August, 1492. One hundred twenty persons constituted the population of the *Santa Maria*, *Pinta*, and *Nina*.

Slight mishaps and panics ushered in this memorable voyage. The loss of the *Pinta's* rudder kept the expedition three weeks at the Canaries in unsuccessful search for another vessel, and the volcanic flames of Teneriffe terrified the ignorant and superstitious crews. On the 9th of September, Ferro, the most southwesterly of the Canaries, faded out of sight, and lamentations broke out among the crews, but they were promptly met by the sonorous eloquence of the confident and enthusiastic admiral.

To conceal from the timid crews the real distance which lay between them and their homes, Columbus kept two reckonings. A correct one was retained for his own secret inspection; from this a number of leagues was daily subtracted, and thus the diminished log was shown to the crews. On the 13th of September, Columbus noticed for the first time the variation of the magnetic needle. He endeavored to conceal it from the crews, but the pilots soon observed it and were terror-struck at the sight, fearing that the compass itself was about to desert them in the unknown waste of waters, and leave them guideless and hopeless. Columbus, with quick ingenuity, ascribed the variation to a movement in the polestar itself, and by one of his unfounded but lucky theories succeeded in allaying the alarm of the crews.

Hope and fear swayed alternately in the breasts of the seamen. The admiral alone knew no vicissitudes of feeling. Two days before the first notice of the variation of the needle, the seamen were dismayed by the sight of part of a mast, which had evidently been long in the water, and regarded it as a warning to themselves. Three days afterward they were buoyed up by the appearance of a heron and a tropical bird, neither of which, it was thought, could have ventured far from land. Soon the vessels were within the influence of the trade wind, and were wafted on by it, pleasantly, westward. Patches of herbs and weeds came drifting from the west, and some of them were thought to grow only in rivers. For a time the crews were in the highest spirits. Then came a false report of land to the west, which turned out to be cloudland, and after several similar disappointments the men began to murmur. Even the trade wind was a source of alarm to them, for they feared that in those seas it blew always from the east, and they could thus never return to Spain.

The crisis of their discontent arrived when the vessels were becalmed, or nearly so, amid vast masses of weeds; and it was in vain that Columbus argued with them that the calmness arose from the nearness of land. The nearer they approached the goal the more mutinous they became; and at last they began to speak of making away with the admiral and returning home. Columbus preserved his serenity — now conciliating, now stern, as suited the characters of those with whom he was dealing.

At last, after many disappointments, and when the crews could scarcely be kept from open mutiny, on the 11th of October there were picked up not only river weeds, and a branch of thorn with berries, but a reed, a small board, and a staff, artificially carved. Joy and hope were once more the order of the day. In the evening, after the singing of the usual vesper hymn, the admiral addressed his men in pious and confident accents. At ten at night, Columbus, who had long been gazing anxiously on the horizon from the poop of his vessel, descried what seemed to him a light. At two in the morning a gun from the *Pinta* announced that land was seen. The vessels lay to, until the dawn should reveal the truth.

There, as the day dawned, was disclosed a level island — which proved to be one of the Bahamas — covered with trees, from which the naked natives were running astonished to the shore. It was Friday, the 12th of

October, 1492, a date forever memorable in the history of the world. The voyage had lasted seventy days. Here, on this island, Columbus solemnly planted the cross, called it San Salvador, and took possession of it in the name of Spain. Columbus believed then and ever afterward that he had reached the confines of India, and the new peoples were spoken of as Indians. The insular regions then touched still remain the West Indies.

Onward from this point reached in our narrative, the life of Columbus is so connected with history, general and special, that a rapid summary may suffice for a sketch which is avowedly biographical. Henceforth the biography of Columbus can present little else than developments interesting, indeed, but unimportant, when compared with the grand and primal fact of the discovery itself. Alas! the "little else" is of a saddening and tragical kind.

After discovering, among other islands, Cuba and Hayti — which he named Hispaniola — Columbus erected on the latter the fortress of La Navidad, and established a colony. On the 15th of March, 1493, he arrived from his first voyage at the port of Palos, from which he had sailed on the preceding 3d of August. His reception in Spain was magnificent; his triumphal entry into Barcelona was almost worthy of the man and his achievements. In September of the same year he set sail from Cadiz on a second expedition, with seventeen ships and fifteen hundred men; but calumnies at home forced him to return in 1496. A "department of Indian affairs," as we would say, had been created, and at the head of it was placed Juan Rodrigues de Fonseca, archdeacon of Seville, afterward patriarch of the Indies. He retained the office during thirty years, and was ever the jealous and malignant enemy of Columbus. The chief discoveries of Columbus during his second voyage were Jamaica and the Caribbee islands. He was continually harassed by disputes and jealousies among the new colonists — whose main thought was the search for gold — and, therefore, he did not greatly extend his first discoveries. He did not reach Cadiz until the 11th of June, 1496, and such were the difficulties of the homeward voyage, that he and his crew disembarked, weather-worn and emaciated, and received but a cold reception from the disappointed and lukewarm Spanish public. The still-continued favor of royalty made some amends for this mortification.

The eight ships which he requested for a third voyage were verbally conceded, yet official intrigue succeeded in delaying his departure until the 30th of May, 1498. Little more than six months had elapsed between his return from his first voyage and his departure on his second one. Between his arrival from his second voyage and his departure on his third one, an interval of nearly a year was interposed. During his third voyage Columbus discovered Trinidad, and for the first time touched the American continent near the mouth of the Orinoco, the volume of whose waters convinced him that southward lay a great unknown land. True to his belief that he had reached Asia, he fancied that he had found at Paria the abode of our first parents.

On reaching Hispaniola he was grieved by the spectacle of a disorganized and disobedient colony. His enemies, jealous of his honors and chafing under his discipline, were sending home evil reports of his administration, and at length they succeeded in persuading Ferdinand to despatch another governor to supersede him. To his grievous wrong, as he complained, he was judged as a governor who had been sent to a province under regular government instead of as a captain sent to conquer a nation numerous, warlike, and unsettled, with customs and religions different from their own. Wearied by these complaints, which were skillfully aggravated by Fonseca, King Ferdinand, in an evil hour, despatched Francisco de Bobadilla on a mission of inquiry, with authority to supersede Columbus as governor of the new possessions, if found desirable. The treatment of the great navigator by this person has given an infamous celebrity to his name. When he arrived at Hispaniola in 1500, Bobadilla at once and without investigation superseded Columbus, seized his effects and papers, and despatched him in criminal fashion to Spain, a prisoner and in chains.

The master of the ship which bore to Spain the illustrious captive offered, with respectful compassion, to remove the irons. This with characteristic pride Columbus refused to allow without the king's command; and until the time of his death Columbus kept the fetters as memorials in his chamber. His arrival under such circumstances and in such a condition excited the indignation of the Spanish people, and produced a reaction in his favor. Ferdinand and Isabella ordered his immediate liberation, and provided for his dignified progress to court, where he was received with honor and graciousness. Bobadilla was to be removed forthwith, and Columbus to be reinstated in his governorship. But instead of this an interim governor, in the person of Nicholas de Ovando, whose subsequent conduct toward Columbus was also of the basest kind, was appointed for two years, to pave the way for the return of the great explorer.

Columbus was advanced in years, broken in health, maltreated, betrayed, impoverished — such was his exceeding great reward for his magnificent discoveries. Some men would have lapsed into sullen and discontented inaction, or died of a broken heart. But he was possessed by a great idea. Still he would reach India by the west — India which Vasco da Gama five years before had reached by the passage round the cape. A fourth and last expedition was organized for Columbus, but it was petty in the extreme, compared to that with which Ovando had set forth to assume the government of Hispaniola. Such as it was, it sailed on the 9th of May, 1502. The last of his voyages was also the most perilous.

On this voyage he discovered Cape Honduras; and, skirting the Mosquito coast, he encountered a terrific storm. The name of Cape Gracias à Dios still survives to attest the "thanks to God" there offered up by the devout Columbus for his preservation. The rumored gold mines of Veragua irradiated him with hopes of proximity to the country of the grand khan, and a river talked of by the natives he fancied to be the Ganges. After the discovery of Puerto Bello, a series of perils and disasters, greater than any to which Columbus had yet been exposed, culminated when he reached a harbor of Jamaica with his ships reduced to mere wrecks. He ran them aground near the shore, and they filled with water to the decks. Cabins were erected for the accommodation of the crews, and a faithful coadjutor was despatched to Ovando at San Domingo.

Then there came, and for long months continued, a frightful time of hardship and danger, which staggered even the stout brain and heart of a man like Columbus. To mutinies among his men was added the refusal of provisions by the natives. Hard fighting could not quell the mutineers, and they were at last expelled from the ships. The natives were vanquished by Columbus' dexterity and astronomical knowledge. Foreseeing an eclipse of the moon, he threatened them with a darkening of the great orb of night, as significant of the anger of the divinity. The darkness came; the terrified natives implored the great mariner's intervention, promising in return all that he might ask. When the eclipse was about to end, he came forth from his cabin, announcing that heaven had relented; and as the moon recovered her brightness, the savages believed him.

At last the long and purposely delayed ships arrived from Ovando. Columbus and the survivors of his crew reached San Domingo to find his own mild policy overturned, and the old native population nearly extinguished by massacre. With heavy heart he set sail for Spain, and on the 7th of November, 1504, he dropped anchor in the harbor of San Lucar.

Eighteen months more and Columbus was at last to enjoy repose — the repose of the grave. Sad and dreary months! He was steeped in poverty — his just dues were denied him. "I live by borrowing," he writes once. Yet he was more solicitous for the payment of his seamen than of himself. His health was irretrievably gone, and ultimately rheumatism prevented him from continuing to write the applications for justice to which the coldest replies were vouchsafed. His best friend, Queen Isabella, died, and with her Columbus' hopes. But to the last he preserved the pride which, in earlier years, had made him reject the offered coöperation of the crown, rather than abate one jot of his just claims.

From Seville he dragged himself to Segovia, where Ferdinand received him frostily. The king offered, indeed, to refer to arbitration all matters in dispute between Columbus and the crown, but he insisted on including in them the claim to reinstatement in his office of viceroy. Columbus refused. All mere money matters he would refer to arbitration, but his inalienable honors and dignities, never. Months of delay ensued, until the final voyage was to be made. Conscious of his approaching end, Columbus made at least one will, of which the authenticity is indisputable, and having received the sacrament and performed the other offices of his faith, he died at Valladolid May 20, 1506.

In manus tuas, Domine, commendo spiritum meum — "Into thy hands, O Lord, I commend my spirit" — were his last words. To make up somewhat for his injustice, Ferdinand gave

Columbus a pompous funeral, and erected a magnificent monument to his memory, as if "Honor's voice" could

"Provoke the silent dust,
Or flattery soothe the dull cold ear of Death."

He was buried first at Valladolid, whence his remains were removed to the Carthusian monastery of Las Cuevas, near Seville.

Columbus was tall and well formed, his complexion fair and inclined to ruddy; his nose aquiline, his eyes light gray and apt to kindle. He was simple in his dress and mode of living. His sharp temper was kept well under control. He was eloquent when the discourse ran on high topics, affable and fascinating in ordinary intercourse, and his domestic amiability was as charming as his public demeanor was elevated and dignified. His devoutness was of an enthusiastic kind, and he was noted for his strict attention to the offices of religion.

"To his intellectual vision," says Washington Irving, "it was given to read in the signs of the times, and in the reveries of past ages, the indications of an unknown world, as soothsayers were said to read predictions in the stars, and to foretell events from the visions of the night. 'His soul,' observes a Spanish writer, 'was superior to the age in which he lived. For him was reserved the great enterprise to plough a sea which had given rise to so many fables, and to decipher the mystery of his time.' With all the visionary fervor of his imagination, its fondest dreams fell short of the reality. He died in ignorance of the real grandeur of his discovery. Until his last breath, he entertained the idea that he had merely opened a new way to the old resorts of opulent commerce, and had discovered some of the wild regions of the East. He supposed Hispaniola to be the ancient Ophir, which had been visited by the ships of Solomon, and that Cuba and Terra Firma were but remote parts of Asia. What visions of glory would have broken upon his mind, could he have known that he had, indeed, discovered a new continent, equal to the whole of the old world in magnitude, and separated by two vast oceans from all the earth hitherto known by civilized man! And how would his magnanimous spirit have been consoled, amidst the chills of age and the cares of penury, the neglect of a fickle public, and the injustice of an ungrateful king, could he have anticipated the splendid empires which were to spread over the beautiful world he had discovered, and the nations and tongues and languages which were to fill its lands with his renown, and to revere and bless his name to the latest posterity!"

1543	Publication of his great work; died at Frauenburg, Prussia, ...	70

Nicolas Copernicus, or Koppernigk, celebrated mathematician, and the founder of modern astronomy, was born at Thorn, Prussia, then a part of Poland, February 19, 1473. Notwithstanding the celebrity of the system — the Copernican — which still bears his name, the materials are very scanty regarding his life and character.

His father, whose name was also Nicolas, was a surgeon, and, it is believed, of German extraction. That the elder Koppernigk was not a native of Thorn, or of Poland, even, appears from the fact that he was naturalized in 1462. He there married Barbara, of the noble Polish family of Watzelrode, one of whose brothers attained the high dignity of bishop of Ermeland in the year 1489. Through the prospects of advancement which this connection held out to young Koppernigk, his father was probably induced to destine him for the ecclesiastical profession.

Copernicus first acquired at home the elements of a liberal education, and, in 1491, entered the university at Cracow, where he remained until he received the diploma of doctor in arts and medicine. He is said to have gained considerable proficiency in the latter branch of study; and he possessed, even in more advanced life, so high a reputation for skill and knowledge, as to produce an erroneous belief that he had once followed the practice of medicine.

Copernicus also exhibited at an early age a very decided taste for mathematical studies, especially for astronomy; and attended the lectures, both public and private, of Albert Brudzewski, then mathematical professor at Cracow. Under the latter, Copernicus, as we shall hereafter call him, became acquainted with the works of the astronomer, John Müller — now more commonly known by his assumed appellation of Regiomontanus — and the reputation of this celebrated man is said to have exercised a marked influence in deciding the bent of his future studies. A journey into Italy, which Copernicus undertook about the year 1496, also added to his zeal in this direction. One of his brothers and his maternal uncle were already settled in Rome, and this was the destination, therefore, to which his steps eventually tended.

He quitted home in his twenty-fourth year, when his diligence in cultivating the practical part of astronomy had already procured for him some reputation as a skillful observer. It seems to have been in contemplation of this journey, too, that he began to study painting, in which he afterward became tolerably proficient. He first settled for a time at Bologna, where he was drawn by the reputation of the astronomical professor, Dominic Maria Novarra. Copernicus was not more delighted with this able instructor than Novarra with his intelligent pupil. He soon became an assistant and companion of Novarra in his observations, and in this capacity acquired considerable distinction, so that on his departure from Bologna and arrival at Rome, in 1500, he found that his reputation had preceded him. At Rome he was appointed to a professorship of mathematics, lectured on astronomy, and observed an eclipse of the moon. In 1501 he continued his studies at Padua, and in 1503 he was made doctor of canon law by the university at Ferrara.

It does not appear at what time Copernicus entered into holy orders: probably it may have been during his residence at Rome; for on his return home in 1505 he was made superintendent of the principal church in his native city, Thorn. In the year 1497 his uncle, Luke Watzelrode, who in 1489 succeeded Nicolas von Thungen in the bishopric of Ermeland, had enrolled him as one of the canons of his chapter. The cathedral church of the diocese of Ermeland is situated at Frauenburg, a small town built near one of the mouths of the Vistula, on the shore of the lake called Frisches Haff, separated only by a narrow strip of land from the gulf of Dantzig. In this situation, rendered unfavorable to astronomical observations by the frequent marshy exhalations rising from the river and lake, Copernicus took up his future abode, and made it the principal place of his residence during the remainder of his life. Here those astronomical speculations were renewed and perfected, the results of which have forever consigned to oblivion the subtle contrivances invented by his predecessors to account for the anomalies of their own complicated theories.

We should form a very erroneous opinion of the life and character of Copernicus, however, if we considered him, as he sometimes is considered, the quiet inhabitant of a cloister, immersed solely in speculative inquiries. His disposition did not unfit him for taking an active share in the stirring events which were occurring around him, and it was not left entirely to his choice whether he would remain a mere speculator of them.

The chapter of Ermeland, at the time when he became a member of it, was the center of a violent political struggle, in the decision of which Copernicus himself was called on to act a considerable part. In the latter half of the fifteenth century a bitter war was carried on between the king of Poland and a military-religious fraternity, called the Teutonic or German knights of St. Mary of Jerusalem, who were incorporated toward the end of the twelfth century. Having first been invited temporarily into Prussia, they finally established themselves permanently in that country, built Thorn and several other cities, and gradually acquired a considerable share of independent power.

On the death of Paul von Sengedorf, bishop of Ermeland, Casimir, king of Poland, in pursuance of a design which he was then prosecuting, to get into his own hands the nomination of all the bishoprics in his dominions, appointed his secretary, Stanislas Opporowski, to the vacant see. The chapter of Ermeland proceeded, notwithstanding, to a separate nomination, and elected Nicolas von Thungen. Opporowski, supported by Casimir, entered Ermeland at the head of a powerful army. From this period the new bishop of Ermeland necessarily made common cause with the German knights; they renounced their allegiance to the crown of Poland, and threw themselves on the protection of Matthias, king of Hungary.

At length, Casimir, finding himself unable to master the confederacy, separated Nicolas von Thungen from it, by agreeing to recognize him as prince bishop of Ermeland, on the usual condition of homage. Nicolas thus became conformed in his dignity, but his unhappy subjects did not fare better on that account, the country being now exposed to the fury of the German knights, as it had suffered before from the violence of the Polish soldiery. These disturbances were continued during the life of Luke Watzelrode, and the city of Frauenburg, as well as its neighbor Braunsberg, frequently became the theater of warlike operations.

The management of the see was often committed to the care of Copernicus during the absence of his uncle, who on political grounds resided for the most part at the court; and his activity in maintaining the rights of the chapter rendered him especially obnoxious to the Teutonic order. In one of the short intervals of tranquillity they took occasion to cite him before the meeting of the states at Posen, on account of some of his reports to his uncle concerning their encroachments. Gassendi, who mentions this circumstance, merely adds that at length his work and his uncle's merit secured the latter in the possession of his dignity. In 1512 Watzelrode died, and Copernicus was chosen administrator of the see until the appointment of the new bishop, Fabian von Losingen. In 1518 the knights under their grand master, Albert of Brandenburg, took possession of Frauenburg and burned it.

During the following year hostilities continued in the immediate neighborhood of Frauenburg, but in the course of that summer negotiations for peace between the Teutonic order and the king of Poland were begun, through the mediation of the bishop. At last a truce was agreed upon for four years, during which Fabian von Losingen died, and Copernicus was again chosen administrator of the bishopric. In 1525 peace was concluded with the Teutonic knights, Albert having consented to receive Prussia as a temporal fief from the king of Poland. It was probably on this occasion that Copernicus was selected to represent the chapter of Ermeland at the diet of Graudenz, where the terms of peace were finally settled; and by his firmness the chapter recovered a great part of the possessions which had been endangered during the war.

This service to his chapter was followed by another of a more strictly political nature. During the struggle which had continued with little interruption for more than half a century, the currency had become greatly debased and depreciated; and one of the most important subjects of deliberation at the meeting at Graudenz related to the best method of restoring it. There was a great difference of opinion whether the intended n w coinage should be struck according to the old value of the currency, or according to the depreciated value. To assist in the settlement of this important question, Copernicus drew up a table of the relative value of the coins, then in circulation throughout the country. This he presented to the states, accompanied by a report on the subject of great practical value. Throughout the whole troublesome period of which we have just given an outline, Copernicus seems, indeed, to have displayed much political courage and talent, entirely aside from his scientific endowments. When tranquillity was at length restored, he resumed the astronomical studies which had been thus interrupted by more active duties.

There appears to be little doubt that the philosopher began to meditate on the ideas which led him to the theory of the solar system set forth in his book — *De Revolutionibus Orbium Cœlestium* — at least as early as 1507. The publication of this book, however, he delayed for many years. During the greater part of that time he was employed in collecting, by careful observation, the materials of which it is constructed and the opinions on which it is based, comprising the whole of what was afterward declared by him long before the work itself appeared. He delayed to announce them formally, until he was able at the same time to show that they were not random guesses, taken up from a mere affectation of novelty; but that with their assistance he had compiled tables of the planetary motions, which were immediately acknowledged, even by those whose minds revolted most against the means by which they were obtained, to be far more correct than any which until then had appeared.

Copernicus seems to have practically completed this work about 1530, but it was not until the year of his death that he could be persuaded to give his book to the world by his friends, who urged its publication out of regard at once to his fame and the interests of science. Perhaps the strongest motive for his reticence was the fear of the unpopularity which the work threatened to bring him. Many, who had heard of the views it advocated, doubted if these were in harmony with religion. But it is quite certain that his desire to conciliate the church led him to dedicate his book, when it was published, to Pope Paul III.

The first copy of this life work reached Copernicus when he was no longer able to enjoy the triumph. An attack of dysentery, followed by paralysis of the right side, had destroyed his memory and obscured his understanding. In this state he lingered several days. The copy, it is said, arrived just a few hours before he died. It was placed in his hands, and he seemed to know it! He died May 24, 1543, aged seventy years, a century before the birth of Newton.

He was buried in the cemetery of the chapter of Ermeland, and only a plain marble slab inscribed with his name for a long time marked the place of his interment. Until this was rediscovered in the latter half of the eighteenth century, an opinion prevailed that his remains had been transported to Thorn, and buried in the church of St. John. A colossal statue of him, executed by Thorwaldsen, was erected at Warsaw in 1830, with all the demonstrations of honor due to the memory of a man who holds so distinguished a place in the history of human discoveries.

From the little that is known of the private character of Copernicus, his morals appear to have been most exemplary, his temper good, his disposition kind, but inclining to seriousness. He was so highly esteemed in his neighborhood that the attempt of a dramatic author to satirize him by introducing his doctrine of the earth's motion upon the stage at Elbing was received by the audience with the greatest indignation. The house at Thorn, in which he is said to have been born, as well as that at Frauenburg, in which he passed the greater part of his life, for centuries after his death were objects of veneration. A hydraulic machine for supplying the houses of the canons with water, and another of similar construction at Graudenz, which long continued in use, were said to have been constructed by him.

In the year 1584, Tycho Brahe, the celebrated Swedish astronomer, commissioned Elia Olai to visit Frauenburg for the purpose of more accurately determining the latitude of Copernicus' observatory, and on that occasion received as a present from the chapter the Ptolemaic scales, made by the astronomer himself, which he used in his observatory, and also a portrait of him said to have been painted by his own hand. Tycho placed these memorials, with great honor, in his own observatory, but it is not known what became of them after his death and the dispersion of his instruments.

Besides "The Revolution of the Celestial Orbs," Copernicus also wrote a treatise on trigonometry, and several other minor works. But that upon which his fame rests, is this principal work. It must be observed, however, that the phrase "Copernican system" suggests that our debt to Copernicus is really greater than his work warrants. For it was not until Kepler, Galileo, Newton, and others had supplemented it that the system, in its present form, could be said to be finally established. Almost everyone who has heard the name of Copernicus mentioned, is aware that before him the general belief was that the earth occupies the center of the universe; that the changes of day and night are produced by the rapid revolution of the heavens, such as our senses erroneously lead us to believe, until more accurate and complicated observation teaches us the contrary; that the change of seasons and apparent motions of the planetary bodies are caused by the revolution of the sun and planets from west to east round the earth, in orbits of various complexity, subject to the common daily motion of all from east to west.

The Copernican system of to-day represents the sun to be at rest in the center of the solar system, and the earth and planets to move round it in elliptical orbits. The actual contribution of Copernicus to it will appear from a brief consideration of his book. The character of the reasoning which then passed for demonstration must be borne in mind in judging of the author's procedure in establishing his various positions. It was then thought a sufficient demonstration of a phenomenon to make a supposition, on which its occurrence would be intelligible, without attempting to bring the supposition itself, by an induction of facts, within the truth of nature; many abstract propositions, too, which would not appear to be simply silly, were at that time universally admitted to be of great weight in scientific arguments.

Illustrations of both of these peculiarities may be gleaned from the first of the six books of *De Revolutionibus*. It contains the following propositions: (1) That the universe is spherical. This is established by such arguments as that the sphere is the most perfect figure, etc. (2) That the earth is spherical, which flows from the same kind of considerations. (3) That the earth and the sea make one globe. (4) That the motions of all the heavenly bodies must be uniform and circular or compounded of uniform and circular motions. Here, again, we meet with singular reasons. A simple body must move circularly, and nothing but circular motion could give periodicity to phenomena. (5) That, supposing the distance of the stars to be immense, there is no reason why the earth should not have a motion round its axis as well as a motion in its orbit. (6) That the sphere of the stars is immensely distant. The proof is fanciful, and shows he had no notion of a universe of stars pervading space. (7) and (8) The ancients were wrong in placing the earth at the center of the universe. The arguments under this head are as imaginary as those which they were designed to refute. The falling of a body to the earth he deduces from the assumption that it is only given to wholes to move circularly, while it is of the nature of parts, separated from their wholes, to move in right lines. That there must be a *centrum mundi*, an entity unknown to modern science, is admitted, the question being as to its position. (9) It is possible for the earth to have several motions. (10) He establishes the order of the planets, and draws a diagram of the system much as it is now represented. It may be observed that, following the old systems, such as the Ptolemaic, he lays down a sphere for the fixed stars. It is clear, also, that he had no idea of the motions of planets other than that they were such as would be caused by their being fixed in immense crystal spheres revolving round the sun.

The most brilliant and valuable part of the *De Revolutionibus* is that in which he explained, for the first time, the variations of the seasons, the precession of the equinoxes, and the stations and retrogradations of the planets. In general, his explanations are right and perfect as to the general nature of the causes of the phenomena. But Copernicus had neither mathematical nor mechanical knowledge sufficient to enable him to explain more than the mean motions of the solar system. To account for irregularities, he was obliged to introduce a system of epicycles entirely resembling that of Ptolemy.

This arose from the false notion of his times, that all motions must be compounded of circular ones, with the application of which idea, and with the invention of convenient epicycles, the greater part of the *De Revolutionibus* is occupied. It may further be added that Copernicus had no answer to offer to the mechanical objections to his system. Most of them, indeed, were such as could not possibly be met in the state of mechanical knowledge at the time. One of the commonest was that against the axial motion of the earth: that it was inconsistent with the fact of bodies falling to the points of the earth directly beneath the points from which they are dropped. For this he had no answer, nor could he have, the laws of motion not yet being discovered. Such being the state of the case, the reader will consider whether, when Copernicus wrote that he held the doctrine of the earth's motion as a mere hypothesis, and not as absolutely in fact true, it is more likely that he made a concession to the religious prejudices of his times, or to difficulties surrounding his hypothesis, which he could well appreciate though not overcome.

Copernicus came into the world at that period of revival when the human mind seemed suddenly to wake up after a sleep of ages. That sleep, however, had been apparent and not real, for all the great problems then so eagerly canvassed were not few. More than once they had been put forward by bold thinkers whose utterances were soon stifled by the dominant authority, or failed to find an echo among their contemporaries.

As a general rule it may be safely maintained that every revolution openly accepted has been previously accepted in men's minds. Thus a long time prior to the discovery of America the probable existence of a fourth part of the world had been spoken of, and Copernicus himself was well aware that he was not the first to make the earth move round the sun. But extraordinary perseverance was required in order to gain a hearing for his theory; and in this respect the recent discovery of the new world was a great help to a revolutionary astronomer. There was now no obstacle to the earth's circulating in space, since it had been demonstrated that it forms, with the ocean, one single globe; that it is not immoderately large, and that there may really exist underneath us inhabitants whose feet are opposed to our own.

Yet to no man is granted the power of discovering all truths at once. Copernicus continued to deceive himself, in common with the ancients, in reference to the movements of the planets, and he made a great error in his theory of what he called the "third movement of the earth." In spite of these mistakes and shortcomings, Copernicus is the father of those men of genius who have created modern astronomical science; and the name of the canon of Frauenburg will be ever memorable, because, to cite his own stately language, he placed "the light of the world — the orb which governs the planets in their circulation — upon a royal throne, in the midst of the temple of nature." Kepler and Newton penetrated much more deeply into the mysteries of the heavenly bodies, but it was Copernicus who gave them the key; and even at the present day, after their immortal labors, the true explanation of the universe is rightly called the Copernican system.

PALISSY

A. D.		AGE
1510	Born at La Chapelle Biron, France,	..
1528	Began his travels in France and Germany,	18
1539	Married; settled at Saintes, France,	29
1543	Appointed to survey the marshes of Saintonge,	33
1546	Embraced Protestantism,	36
1555	Enamel experiments successful,	45
1575	Public lecturer in Paris,	65
1580	"Discourses on Waters and Fountains,"	70
1588	Imprisoned in the Bastille, Paris,	78
1589	Died in the Bastille,	79

BERNARD DE PALISSY, potter and naturalist, famous as the discoverer of china enamel, was born at La Chapelle Biron, in the province of Périgord, France, about 1510. His father was a tile maker, or worker in clay, and in his early youth Palissy kneaded marl and burned tile at his father's kiln. Later he was apprenticed to a glass stainer at Agen, and made rapid progress.

To render himself better fitted for the art which he had adopted, he spent the hours of the night, and what money he could spare from his wages, to obtain all the scientific knowledge and manual skill relating to his craft. His mind, both ardent and persevering, became trained as well as his hand. He soon acquired geometry, drawing, painting, and the elementary part of sculpture. The search for subjects for design also led him to study sacred and profane literature, as he turned over the pages of books to find scenes, descriptions, and allegories. While studying a single business, with the view of extending his knowledge to its utmost limits, he learned a little of everything. He thus, unwittingly, laid the foundation for the man of letters, poet, theologian, philosopher, and politician, which he became in later years.

The art-glass craft at that time ranked almost on the same plane as that of the nobility itself because of the technique and dignified form of art it implied. It included not only the melting of glass, but the geometrical and artistic shaping of it to cathedral or chapel windows, and its decoration with landscapes, animals, figures, and the mysteries of religious symbolism. In the language of Lamartine, "The glass windows were a poetical lesson-book for the people that frequented the churches. They brought home to the minds of the peasantry the creation of the world, the delights of the terrestrial paradise, with its rivers, trees, lions, lambs, and birds, the companions of men; the miracles of revealed religion, the sufferings of the crucifixion, the martyrdoms in the circus, the resurrection and the assumption of the victims of the new faith — then the heavens open, with the Father eternal, the Son, the Word, and the mercy of God, and the Holy Spirit under the form of a dove flying from the one to the other, to denote the unity of the Trinity, and giving forth rays from its glowing breast, to spread everywhere light and love. Lastly, the souls of the blessed, represented by numberless winged faces, scattered about like the stars in the sky, and rejoicing in the divine radiance in the dwelling of the Father."

"It is characteristic of real genius," continued this same writer, "always to aspire to universality. The limits, indeed, which are said to separate one science from another are simply the limits of our knowledge. Genius always overleaps them to reach the infinite, the true field of human thought. In the infinite, all things are united completely and harmoniously into one great whole. The universe is but infinite art, which sketches, carves, draws, paints, writes, and sings the revelation of the beautiful, which is God. Thus it was understood by Palissy."

His contact with geometry and designing, as well as his love of outdoor life, led Palissy also to study surveying, and, in an elementary way, topographical engineering. When he had acquired considerable proficiency in these various arts, he set out to make the tour of France — which was the custom among artisans of that time — living by the products of his two trades of glass painting and surveying. Between 1528 and 1530 he first worked his way from town to town until he reached Tarbes, built on a table-land facing the Pyrenees, and in which glass painting then flourished. Soon, attracted by the picturesque scenes which were spread before his eyes, he felt himself a painter, at the sight of this picture of nature, and left for a time his glass and clay to wander among the gorges and cliffs of the mountains, in which the Divine Artist seems to have sported with peaks and ravines amid the grandest and most beautiful scenes of nature. If Bernard de Palissy was a mere workman when he entered the labyrinth of the Pyrenees, he left it a painter and a poet.

His wanderings over the Alps and the Pyrenees, and the great interest he took in the various qualities of the earths, rocks, sands, and waters, on account of the relation they bore to his business, had made him a naturalist, also. He employed his leisure hours in wandering over the woods and meadows; in searching the beds of springs; in catching the reptiles, beetles, and insects which inhabit the marsh among the rushes and tall water plants; in climbing the mountains, and finding his way to the precipitous ravines and deep caverns. The vast view within the distant horizon of the mountain-top, the varying hues of the sky, the changes of the leaf and of the greensward of the meadows, made a pleasing and a lasting impression on his sight, hereafter to be reproduced under his hand. To the solitary child of genius, nature was both a teacher and a store. He reveled in the ecstasy, the truth, and the simplicity of his feelings; and the want of an interpreter in these conversations between Palissy and nature afterward gave rise to a new art.

He married about 1539 and settled permanently at Saintes. His trade of glass painter gave him but a pittance. He was restless and constantly experimenting. It was necessary to provide for a rapidly expanding family, and in 1543 he temporarily turned to the surveying of land in the Saintonge, under the officers of the revenue, who came in the king's name to mark out and measure estates for the land tax. This work did not take him away from the constant object of his study — the earth. While surveying, he tried the clay, felt the sand, crushed the stones, and thought upon the mixtures and combinations of ingredients most likely to lead to those fortuitous discoveries of material, ground, color, and glaze, which had been the object of his thoughts from the day when he first handled a trowel.

A small fragmentary cup of Italian majolica ware — evidently of Luca della Robbia — falling into his hands, he set himself to find out the secret of making glaze, enameled ware being at that time unknown to French industry. If he could make such cups as this he thought he should obtain both wealth and fame. This bit of majolica seemed to stimulate his mind, as the fall of an apple did Newton's; or as the ivy branch floating on the ocean, with its leaves still green, led the first navigators of the Atlantic, the companions of Columbus, to suspect that land was near.

Tired of the lucrative but temporary and monotonous employment of surveying, he returned home to his wife, with a determination to try all and risk all for her sake and the sake of his children — to complete his invention or perish in the attempt. The story of his struggles, his poverty, the contempt of friends and neighbors, the cries and upbraidings of wife and children, have been too often told at length to be more than mentioned. It is sufficient to know that sixteen years had elapsed since he first entertained the idea before the final triumph came, and he was able to produce in all their perfection of color the works of art which had been ever present in his imagination. He now made vases, statuettes, dishes, plates, and divers utensils, ornamented in relief, richly colored and highly enameled, which he called *rustic figulines*.

His renown now spread with his works; and the price that he received for his enameled earthenware — his sculpture in clay — raised his house and his family from their misery. Glory and wealth visited together, although late, his furnaces. His productions — rough at first, and imperfect, but in which we may see the rising vigor of a new art, born of itself, and not trammeled by tradition — soon adorned mansions and palaces. Paris — to which Catharine de' Medici had called the genius, the arts, and the ideas of Italy — attracted him, as it had attracted the great sculptors of the age — Jean Cousin, Germain Pilon, and Jean Goujon, the heirs of Raphael and Michaelangelo. Great men received him; little men envied him. The Marshal de Montmorency became his patron, and Catharine de' Medici gave him a site for his furnaces on a portion of the ground now occupied by the palace of the Tuileries. She used to visit him at his work, like the princes of her family at Florence, who spent much of their time in the studios and society of artists — those princes of nature, of labor, and of genius.

It was at a happy and honored period of his life that he made his numberless masterpieces of porcelain in relief, and dishes ornamented with figures, beasts, reptiles, insects, beetles, plants, and flowers, which, after having been dug up at the end of three centuries from the burial places in the mansions of the rich, now make their appearance, and sell for their weight in gold, as treasures of art, full of grace, beauty, and simplicity, to take their places in the museums of palaces and in the cabinets of the wealthy, who do honor to their riches by making their houses the repositories of art.

Many of the masterpieces of Palissy, after he had become a more consummate artist by seeing great pictures and fine sculpture during his stay in Paris under the patronage of Catharine de' Medici, later found their way to the private collections of Prince Soltikoff, in Paris; of Baron Rothschild, in London; of M. Sauvageot; M. Rallier; and of M. Sellières, who devoted himself to the memory of this great artist by making his house a museum of the great potter's works. Magnificent specimens of his work are also to be found in the Louvre, the Musée de Cluny, and at Sèvres. Some may be seen in the South Kensington and British museums, London, and the Fountaine collection at Narford hall, England, is scarcely equaled by any even in France.

At the present day his works are almost beyond price, and his ornaments and arabesques must be classed among the most beautiful of the renaissance period. His faïence is of a peculiar style. All figures and other ornaments are executed in colored relief, the colors being unusually bright, but not of great variety. The blues, grays, and yellows generally prevail.

It was about 1559 that France was greatly beset by the struggles between Catholicism and Protestantism. In 1546, with all his family, Palissy had embraced the new ideas of Luther and Calvin, and contributed much toward the foundation of a reformed church at Saintes. It was not to be supposed, therefore, that he could escape the rigors of persecution. He was denounced to the authorities, incarcerated at Bordeaux, and it required the intervention of Montmorency, aided by Catharine de' Medici, to save his life. The ingenious inventor of *rustic figulines* must not become a sacrifice to religious contention; so a stratagem was resorted to that clemency might be shown without opposition to the edict. By the intercession of Catharine he was named inventor of *rustic figulines* to the king, and by this became answerable only to the grand council. By means of these powerful friends he escaped the jurisdiction of the parliament at Bordeaux, and went to Paris soon after, being charged with the decoration of the royal gardens of the Tuileries, in which work he associated with him his two sons, Nicolas and Mathurin.

During many years he lived at Paris, sheltered and protected by royalty, escaping the horrors of the massacre of St. Bartholomew, and giving his leisure, not only to his artistic employments, but to the study of chemistry, geology, and natural history, for all of which he had a special genius. In 1575 the "Huguenot potter" began a course of public lectures, to which he called all the learned doctors of the capital to assemble and hear in three lessons the exposition of his theories on natural history; these discourses became so popular that they were continued for many years. In 1580 a number of them were published under the title "Discourses on Waters and Fountains."

French science owes a large debt to Palissy; he was the first in France to substitute for the vain explanations of the philosophers positive facts and rigorous demonstrations. M. Hoefer, in his "History of Chemistry," remarks that Francis Bacon was still a child when Palissy was publicly teaching at Paris that to obtain the truth it is necessary to have recourse to experience. Palissy did for chemistry what Bacon did for science in general, pointed out its true method. Many of Palissy's observations are beyond the teaching of his time. His classification of salts is still regarded as exact, and he was the first to establish a rational theory of crystallization.

The hate of the theologians, excited no doubt by his scientific opinions, revealed itself all at once in the midst of the comfort which he was enjoying. In 1588 the royal family could shelter him no longer; he was arrested as being a Protestant and sent to the Bastille. Here he occupied his captivity in writing those things concerning his art, his soul, and his faith, which have been pronounced by able critics as among the most remarkable in any language.

He was then approaching those last hours of life when the voice of the soul acquires additional melancholy and solemnity, like the sounds of evening when nature puts on her veil of darkness and repose. His patron took pity on the aged man, who was about to die in his fetters, and thus change from one tomb to another. King Henry III. went to visit him in his prison, desiring to give him his liberty, and asking, as the price of his pardon, the easy condition of giving up his faith.

"My worthy friend," said the king, "you have now been forty-five years in the service of my mother and myself; we have suffered you to retain your religion amid fire and slaughter. I am so pressed by the Guises and by my people, that I find myself *compelled* to deliver you into the hands of your enemies; and to-morrow you will be burned unless you are converted." The old man bowed, touched by the goodness of the king, humbled by his weakness, but inflexible in the faith of his fathers. "Sire," he answered, "I am ready to give up the remainder of my life for the honor of God. You have told me several times that you pity me, and now, in my turn, I pity you, who have used the words *I am compelled*. It was not spoken like a king, sire! and they are words which neither you, nor the Guises, nor the people shall ever make me utter. I can die!"

The courtiers who accompanied the king, instead of admiring his courage, were angry. "Here is insolence!" exclaimed they; "one would suppose he had read Seneca, and was parodying the words of the philosopher, 'He who can die need never be constrained.'"

Henry III., more merciful than his court, in consideration of the beautiful works which graced his palace, and of his mother's memory, would not give up Palissy to the Guises, but suffered age and natural decay to finish the prisoner. A voluntary martyr, in the dungeons of the Bastille, he gained his liberty only in death, in the year 1589.

The principal book of Palissy's maturity is a collection of philosophical, religious, artistic, and especially horticultural meditations, which he calls his "Garden." These writings have been eloquently characterized by Lamartine as follows: "The old workman, reposing like Solomon in the setting sun of a holy and laborious life, remembers the phenomena of nature, of his art, and of his soul, which have left an impression on his mind and heart during his pilgrimage here below. It breathes the spirit of the laborer, the workman, and the dreamer; we feel that it is pervaded by the adoration of the great Creator in spirit and in truth. The love of nature gives him the power of understanding her, and his knowledge of his model explains to him the laws, the powers, and the beauties of creation.

"Alas! it was within the walls and moats of his prison-house, separated from his wife by the grave, and from his children by his captivity; shut out from the view of the Seine by proscription; from the tools and pursuit of his trade by old age; from his brothers in religion by martyrdom, that Palissy wrote these records as mental consolation for his ruin, his dungeon, and his approaching death. His scattered leaves, long forgotten, and at last collected, form two volumes, real treasures of human wisdom, divine piety, and eminent genius, as well as of great simplicity, vigor, and copiousness of style. It is impossible, after reading them, not to consider the poor potter one of the greatest writers of the French language. Montaigne is not more free and flowing; Jean Jacques Rousseau is scarcely more graphic; neither does Bossuet excel him in poetical power. In his allegories, his reflections, his pathos, his descriptions, and his poetry, he is as great as any of the authors I have named."

Palissy is an original genius — like Rabelais, Cellini, and Leonardo da Vinci, a characteristic product of the renaissance. His life, aims, and opinions are well worth the study of those who are seeking for new ideas. Like Benjamin Franklin, he is the highest possible example for the self-made man, and, as with the American, a money success was but the stepping-stone to a higher life.

It is as a practical man, however, and not as a man of science, that the world is most indebted to Palissy. He is the most perfect model of the craftsman. "It is by his example," says Lamartine, "rather than by his works, that he has exercised an influence on civilization, and that he has deserved a place to himself among the men who have ennobled humanity. Though he had remained unknown and listless, making tiles in his father's pottery; though he had never purified, moulded, or enameled his handful of clay; though his living groups, his crawling reptiles, his slimy snails, his slippery frogs, his lively lizards, and his damp herbs and dripping mosses had never adorned the bottoms or edges of those dishes, ewers, or salt-cellars, those quaint and elaborate ornaments of the tables and cupboards of the sixteenth century, it is true nothing would have been wanting to the art of Phidias or of Michaelangelo — to the porcelain of Sèvres, of China, of Florence, or of Japan, but we should not have had his life for the operative to admire and imitate. He is the patriarch of the workshop, the poet of manual labor in modern days; he is the potter of the *Odyssey*, the Bible, and the gospel, the type incarnate to exalt and ennoble every business, however trivial, so that it has labor for its means, progress and beauty for its motive, and the glory of God for its end."

Although Lamartine has probably been somewhat over-enthusiastic in his glowing estimate of Palissy, yet we can turn to no other biographer who has a finer appreciation of Palissy's true place in history. "Untaught," says this writer, "save by himself, he feels that he has a genius in his fingers' ends. He does not trample the fine earth under his feet; he despises not the common material which his situation has placed in his hands; he endeavors to purify and ennoble it by an infusion of his own spirit; he travels over the country with his trowel and knife, earning his bread honorably from kiln to kiln; and, when his business has nothing more to teach him, he goes into the wilderness to examine nature, the teacher of teachers, by unveiling her mysteries; he acquires love and enthusiasm for her by dint of contemplation; he rivals her in form, color, and in playful ease; he transports the leaf, the herb, the fly, the reptile, the insect, the brook, the dew, the dampness, the freshness, and the gleam of light to a piece of clay. In seeking the perfection of art, which hides itself that it may be discovered, and which holds itself back that it may be mastered by force, he meets with misery, unbelief, and the scorn of his neighbors; he follows his pursuit obstinately, and even savagely; he burns his house to feed his last furnace; he forces his inventive genius; he exhausts the folly of hope and the heroism of labor; finally, he is rewarded, he triumphs, he becomes illustrious, and enriches his children.

"But these earthly rewards, for which he gives thanks to Providence, are as yet as nothing to him: the laborer is satisfied, but not the man; he thirsts after the beauty and glory of the Eternal. The most precious discovery of his solitary contemplation of nature is not his art, but God, the object and end of every perfect art. In his leisure hours he writes his wonderful meditations; he gives full scope to his intellect in his hymns, the produce of his piety, far more than in his vases, the work of his hands. Without study and unlettered, his soul bursts forth with a holy enthusiasm. He attaches himself with steadfast faith to the persecuted worship of his brethren. He devotes his youth to trade; he sacrifices his house for his art; he gives up his old age, his liberty, and his life to his God; he flies from his dungeon to heaven on the wings of celestial hope; he leaves behind him masterpieces — vain works, doubtless, like the grottoes of earth, sand, or shells that children leave forgotten where they have played with their companions, but he bequeaths impressive lessons and immortal examples of labor, of patience, of perseverance under difficulties, of mastery over matter, of gentle dignity, piety, and virtue to workmen of all professions.

"His life signifies labor; his works, invention; his death, martyrdom. His book becomes the manual not only of the manufacture of earthenware, but also of the more sublime profession of speaking right, doing right, and living right; his name is a beacon to all unkindly, stubborn, yet successful occupations. Palissy has thus won a legitimate place among the great men who have risen from obscurity. Some will say, 'But he only moulded clay!' What can it signify? Greatness does not depend upon the occupation, but upon the mind. If *such* a man be little, who then is great?"

1642	Died at Arcetri, near Florence, . .	78

GALILEO GALILEI, celebrated scientist, the founder of physics, was born at Pisa, Italy, February 15, 1564, three days before the death of Michaelangelo. His father was a distinguished musician, and a descendant of the ancient and illustrious Florentine family of Bonajuti, who, in the fourteenth century, had changed their name to Galilei. The boy showed early signs of ardent and versatile genius. He constructed mechanical toys for his schoolfellows; he threw himself eagerly into Greek and Latin study; he inherited his father's skill in music; and he showed remarkable aptitude for painting, to which two generations earlier his life would probably have been devoted. In his eighteenth year he was sent to the university of Pisa, where he attended the lectures of the great Cesalpino, one of Harvey's forerunners.

In accordance with the desire of his father, Galileo at first directed his attention exclusively to medical studies and the prevailing Aristotelian philosophy, the dogmas of which he soon ventured to disbelieve. At the age of eighteen he made one of his most important discoveries. Happening on one occasion to observe, in the cathedral of Pisa, the oscillation of a lamp casually set in motion, he was struck with the regularity of its vibrations. He then proceeded to test the correctness of this observation by comparing the beat of his own pulse with the action of the pendulum, and concluded that by means of the equality of oscillation a simple pendulum might become an invaluable agent for the exact measurement of time. This discovery he subsequently utilized by the successful application of the pendulum in constructing a clock for astronomical purposes.

Galileo's decided bent toward mechanical construction and experimental science received a new impulse from his contact with a friend of his father's, Ostilio Ricci, professor of mathematics at Pisa, who now directed his studies, and from whom he received, at the age of twenty-two, his first lesson in Euclid. From this time onward he seems to have practically abandoned medicine and concentrated his powers on his chosen sciences. He soon passed from Euclid to Archimedes, and fastened upon that part of his work, in which the greatest of geometers stood alone, the marvelous researches on the lever and on floating bodies.

The first fruit of his geometrical investigations was the invention of a hydrostatic balance, by which the specific gravity of solid bodies might be ascertained with the nicest accuracy. In 1589, the fame of Galileo's extraordinary learning having reached the grand duke of Tuscany, this enlightened prince appointed him professor of mathematics in the university of Pisa, where he covertly inculcated many of those great innovations in physical science which have since added such luster to his memory. About this period he turned his attention to the then very imperfectly comprehended laws of bodies in motion; and, in opposition to all received systems, he propounded the novel theorem that all falling bodies, great or small, descend with equal velocity. This soon led him to the discovery of "the three laws of motion," and the law regulating the motion of falling bodies. This theory of falling bodies was proved correct by several experiments which were made from the summit of the leaning tower of Pisa.

Galileo and his colleagues did not long remain on good terms. The latter were content with the superstructure which *a priori* reasoners had raised upon Aristotle, and were by no means desirous of the trouble of learning more. Galileo chose to investigate physical truths for himself; he engaged in experiments to determine the truth of some of Aristotle's positions, and, when he found him in the wrong, he said so, and so taught his pupils.

This made the "paper philosophers," as he called them, very angry. He repeated his experiments in their presence; but they set aside the evidence of their senses and quoted Aristotle as much as before.

The enmity arising from these disputes rendered his situation so unpleasant, that, in 1592, at the invitation of the Venetian commonwealth, he gladly accepted the professorship of mathematics at Padua. There, under the shelter of the Venetian republic, he spent the following eighteen years, and did most of his constructive work. His lecture hall had an audience of two thousand, and was crowded with pupils from all parts of Europe; and it was here by him that the Italian idiom was first adapted to scientific instruction. His latest discoveries and his suggestions for original research were poured out to all comers ungrudgingly. The range of subjects was wide. Besides the laws of equilibrium and motion, he dwelt upon the importance of measuring all natural forces, great or small, abstruse or familiar, so as to bring them within the range of geometry, and thus adapt them to the service of man. No one before him had sought to measure heat with precision, and among the notable discoveries which he there gave to the world were: his thermometer; a proportional compass or sector; and his refracting telescope. It was his pupil, Torricelli, who first measured the weight of the atmosphere with the barometer.

In astronomy it was well known that Galileo took the Copernican view. He held, with Bruno, that the universe was infinite, not finite; and that the stars and planets were made of the same substance as the world we live in. So when he became acquainted with the crude telescope, invented in Holland in 1608, he immediately set to work to improve it, and to adapt it to a verification of his views. The Dutch telescope was for terrestrial purposes only; his was for the exploration of the heavens. It was completed in the early part of 1609, and offered to the doge of Venice, Leonardi Deodati, by whom it was tested from the tower of St. Mark with equal surprise and delight. In the same year he constructed a microscope; and then this indefatigable interpreter of the mysteries of nature commenced his astronomical researches by means of his own telescope.

He speedily discovered Jupiter's four moons, the irregular surface of our own satellite, the phases of Saturn, and the solar spots. The first of these has been well described as a miniature Copernican system: all of them showed the solar system to be far more complicated than men thought. His resolution of the milky way into separate stars gave another proof that our sun with its planets was but an atom in a boundless universe. The moons of Jupiter he named the Medicean stars. They have long ceased to be known by that name; but so highly prized was the distinction thus conferred upon the ducal house at Florence that Galileo received an intimation that he would "do a thing just as proper in itself, and at the same time render himself and his family rich and powerful forever," if he "named the next star which he should discover after the name of the great star of France, as well as the most brilliant of all the earth, Henry IV." These discoveries were made known in 1610, in a work entitled *Sidereus Nuncius.*

When, in 1609, he received an invitation to return to his original situation at Pisa, he sent a letter, still extant, which indicates the catalogue of undertakings on which he was already employed:

"The works which I have to finish," he says, "are principally two books on the 'System or Structure of the Universe,' an immense work, full of philosophy, astronomy, and geometry; three books on 'Local Motion,' a science entirely new, no one, either ancient or modern, having discovered any of the very many admirable accidents which I demonstrate in natural and violent motions, so that I may, with very great reason, call it a new science, and invented by me from its very first principles. Although others have treated this same matter, yet all that has been hitherto written, neither in quantity nor otherwise, is a quarter of what I am writing on it.

"I have also different treatises on natural subjects — on 'Sound and Speech,' on 'Light and Colors,' on the 'Tides,' on the 'Composition of Continuous Quantity,' on the 'Motions of Animals,' and others besides. I have also an idea of writing some books relating to the military art, giving not only a model of a soldier, but teaching with very exact rules everything which it is his duty to know that depends upon mathematics, as the knowledge of castrametation, drawing up of battalions, fortifications, assaults, planning, surveying, the knowledge of artillery, the use of instruments, and so on."

Out of this comprehensive list, the treatises on the universe, on motion and mechanics, on tides, on fortification, or other works upon the same subjects, have been made known to the world. Many, however, of Galileo's manuscripts, through fear of the inquisition, were destroyed, or concealed and lost, after the author's death.

Shortly after this letter was written, the Venetian senate raised Galileo's salary. But as the grand duke offered him equal advantages in Florence, with a liberal salary, exemption from the necessity of residence, and complete leisure to pursue his studies, patriotism turned the scale. He left Padua for Florence in 1610, and from that time until his death he never knew peace. Neither Copernicus nor his immediate followers suffered inconvenience or restraint on account of their astronomical doctrines: nor had Galileo, until this period of his life, incurred ecclesiastical censure for anything which he had said or written. But in the war between science and theology, which was now instituted, he was eager for the fight; he had powerful friends, and felt sure of victory. In 1611 he visited Rome, and freely advocated the new conception of the universe. Systematic clerical opposition now began. A letter from Galileo to Castelli, in which he took the dangerous course of trying to harmonize science and scripture, was laid before the inquisition in 1615. Early in 1616 the propositions of the sun's fixity and the earth's diurnal motion were formally condemned; the work of Copernicus, published seventy years before, was placed on the index; and a promise was extorted from Galileo not to defend his theory.

Galileo now remained silent for seven years; but after his friend Maffeo Barberini became Pope Urban VIII., he went to Rome in 1624 and strove to get those edicts reversed. In this he failed, yet still persisted in writing his celebrated "Dialogue on the Two Chief Systems." This work with much difficulty he obtained leave to print in 1632, on the condition of inserting reservations dictated, it is thought, by Urban himself, which disfigure the preface and the first section of the work. But the dramatic form gave free play to the irony of which Galileo was a master. Simplicius, the personage who advocates obscurantism, was said, truly or not, to be Urban himself. The book spread swiftly through Europe from south to north. It was resolved that Galileo should be crushed. He was summoned to Rome; and on June 22, 1633, he was forced to read and sign a formal abjuration of his belief in the Copernican doctrine. It is said by one of his biographers that even after Galileo had taken the oath of abjuration that the earth moved, he whispered to one of his friends, as he rose from his knees, *E pur si muove* — "It does move though."

He was then sentenced to an indefinite term of imprisonment by the inquisition, which after four days was commuted by Pope Urban, and he was reconducted to the Florentine ambassador's palace. In July he was sent to Siena, where he remained five months in strict seclusion; but he then obtained permission to return to his villa at Arcetri, a mile from Florence, near the convent of St. Matthew, where his daughter, Sister Maria Celeste, was a nun. It is sad to know that this daughter, whose touching letters are preserved, and whose loving care had been his mainstay for years, should have died soon after his return from Rome, worn out by anxiety.

But his strenuous activity survived. His greatest book, the "Dialogues on the Two New Sciences," summing up his work at Pisa and Padua, was completed at this time, and published in 1638 in Holland. He carried on a long correspondence with the Dutch government as to adopting observations of Jupiter's satellites for determination of longitudes. His last astronomical work was to discover the moon's libration. In the course of 1636-37 he lost successively the sight of both eyes. He mentions this calamity in a tone of pious submission, mingled with a not unpleasing pride: "Alas, your dear friend and servant, Galileo, has become totally and irreparably blind; so that this heaven, this earth, this universe, which with wonderful observations I had enlarged a hundred and thousand times beyond the belief of by-gone ages, henceforward for me is shrunk into the narrow space which I myself fill in it. So it pleases God; it shall therefore please me also."

In 1638 he obtained leave to visit Florence, still under the same restrictions as to society; but at the end of a few months he was remanded to Arcetri, which he never again quitted. From that time, however, the strictness of his confinement was relaxed, and he was allowed to receive the friends who crowded around him, as well as the many distinguished foreigners who eagerly visited him. Among these we must not forget Milton, whose poems contain several allusions to the celestial wonders observed and published by the Tuscan astronomer. Though blind and nearly deaf, Galileo retained to the last his intellectual powers; and his friend and pupil, the celebrated Torricelli, was employed in arranging his theories on the nature of percussion, when he was attacked by his last illness. He died of heart disease complicated with fever, on January 8, 1642, aged seventy-eight. His remains were placed, by ducal orders, in the cathedral of Santa Croce, Florence, where a majestic memorial now symbolizes his great achievements.

Galileo was of small stature, but of a robust and healthy frame; his countenance was attractive, and his conversation cheerful. He loved art, and cultivated especially music and poetry. Ariosto he knew almost by heart, and appreciated keenly the beauties of this great classic. Tasso, on the other hand, he unduly depreciated, and inflicted much pain on the sensitive spirit of the poet by his severe criticism of him. His own style is nervous, flowing, and elegant, and is at its best in his "Dialogues" and "The Assayer," a controversial work. In the former, nothing can exceed the classic beauty of its style and the compactness of its chain of argument. The latter is a model of philosophical composition.

Galileo keenly enjoyed the social wit and banter of his chosen friends, and the generous pleasures of the banquet; and the readiness with which he offered or accepted atonement modified a somewhat irascible disposition. The greatest deficiencies in his character were a want of tact to keep out of difficulties, and a want of moral courage to defend himself when involved in them. His biting satirical turn, more than his physical discoveries, was the cause of his misfortunes. The dignitaries of the church, who persecuted Galileo, warned him beforehand in the friendliest way to be "more prudent." Their conduct in persecuting opinion, or rather, in Galileo's case, demonstrated fact, is, of course, utterly inexcusable; but that is no reason why we should run to the other extreme, and declare Galileo to be a martyr. No great man had ever less claim to the title. It is also right to add that the congregation of the inquisition by which Galileo was condemned, is not now believed to have spoken with the plenary authority of the Catholic church, nor are its decisions regarded as infallible even by the most extreme ultramontanes.

It may be said generally that the note of Galileo's whole work is mathematical research controlling and controlled by observation of nature. What he did was to found the science of dynamics — essentially mathematical — and to lay the foundations of Newton's demonstrations, nearly a century later. His most important contributions to physical science may be summed up under the following heads: (1) The relation between space and time in the case of falling bodies, also the "three laws of motion"; (2) The path of projectiles is a parabola; (3) The isochronism of the pendulum; (4) That air has weight, also partial discovery that suction is owing to the pressure of the atmosphere; (5) The reinvention of Aristotle's theory respecting sound; (6) The invention of the telescope; (7) The discovery of the satellites of Jupiter, phases of Venus, and spots on the sun.

By many scientists his discovery of the law of velocity is regarded as the crowning point of his fame. Galileo tells us that he put to himself as the simplest hypothesis that equal increments of velocity took place in equal times. As time is infinitely divisible, these increments are infinitely small and numerous, and the problem was to sum them. It was a problem of integration, though so simple as not to need a special calculus. He shows by a simple geometric process that, in motion uniformly accelerated, the time occupied is equal to that spent by a body moving uniformly with velocity equal to half that attained by the accelerated body at the end of the period; that the spaces traversed are as the squares of the time; and, as a corollary from this, that the spaces in each successive interval are to one another as the series of the odd numbers. In a further section of the work Galileo shows, with extreme fullness, that a body, like a projectile, acted on simultaneously by an impulse and by the continuous force of gravity, will move in a parabola. The second law of motion also was clearly known to him.

Original as his discoveries in dynamics were, those in statics were hardly less important; and Lagrange, in the first section of the *Mécanique Analytique,* fully appreciated their importance. His work on the "Utility of Mechanical Science and the Instruments it

Employs" contains on its first page the distinct germ of the principle of virtual velocities, as solving the apparent paradox that the small weight at the long arm of the lever could balance a large one. The velocity with which the two arms tended to move was inversely proportionate to the weights; and the case was, therefore, as though a man, having to carry to a certain distance a load beyond his strength, undertook many journeys and conveyed a portion of it in each. The element of time comes in.

Galileo tested his law of falling bodies partly by direct observation, partly by comparing the spaces traversed in given times upon inclined planes of the same altitude. The velocity, identical at the end of the fall, admitted of measurement more easily in the earlier parts than when the fall was vertical. For abstract mathematics he had little taste. "Philosophy," he says in his *Saggiatore*, "is written in the great book of the universe which lies always open. But we must first understand the language and the character in which it is written. That language is mathematics. Its characters are triangles, circles, and other geometric figures, without which we cannot, humanly speaking, understand the words, and wander aimlessly through a dark labyrinth."

The almost numberless inventions of his acute industry; the use of the telescope, and the brilliant discoveries to which it led; the patient investigation of the laws of weight and motion, must all be looked upon as forming but a part of his real merits, as merely particular demonstrations of the spirit from traditional opinions to the judgment of reason and common sense. He claimed and bequeathed to us the right of exercising our faculties in examining the beautiful creation which surrounds us. Emerson says that "Galileo, with an opera glass, discovered a more splendid series of celestial phenomena than any one since."

If an intense desire of being useful is everywhere worthy of honor; if its value is immeasurably increased when united to genius of the highest order; if we feel for one, who, notwithstanding such titles to regard, is harassed by intolerant persecution, then none deserves our sympathy, our admiration, and our gratitude more than Galileo.

KEPLER

A. D.		AGE
1571	Born at Weil, Württemberg, ...	..
1591	M. A., Tübingen, ...	20
1594	Lecturer on astronomy at Gratz, . .	23
1596	"Cosmographical Mystery,"	25
1601	Assistant to Tycho Brahe, ...	30
1606	"Supplement to Vitellio,"	35
1609	*Astronomia Nova*, "New Astronomy,"	38
1612	Professor at Linz; mathematician to emperor, ...	41
1619	*Harmonice Mundi*, "The Harmonies of the World,"	48
1627	"Rudolphine Tables,"	56
1629	Professor at university of Rostock, .	58
1630	Died at Ratisbon, ...	59

JOHANN KEPLER, or VON KAPPEL (as his family was originally called), was one of the chief founders of modern astronomy. He was the son of Henry Kepler, an officer in the German army, and Catherine Guldenmann, who had made an unhappy marriage, and whose wedded life was continually beset with trouble. The date of his birth was December 27, 1571, and the place Weil der Stadt, in the kingdom of Württemberg, Germany.

As a child, Kepler was of sickly constitution, and of equally marked precocity. To add to his constitutional weakness, he had a severe attack of smallpox in his early youth, which left him in delicate health throughout life. After his recovery from smallpox, he was sent to school in 1577. In the year 1586 he was admitted to the school at the monastery of Maulbronn, which was established during the German reformation, and maintained at the expense of the duke of Württemberg, as preparatory for the university of Tübingen. He entered the university a year later and received his bachelor's and master's degrees, respectively, in 1588 and 1591.

While attending the mathematical lectures of Maestlin, a disciple of Copernicus, he adopted the opinions of his teacher, and wrote an essay to prove that the primary motion was produced by the rotation of the earth. In 1594 he was unwillingly made to accept the astronomical class at Gratz, though he knew little of the subject. He was thus forced to study astronomy, and, in 1595, he devoted all his leisure time, and all his mental energy to studying the size and the motions of the planets, and their orbits. To find them, he built up, with every resource of a most powerful imagination, hypothesis after hypothesis — all of them daring, and many extravagant. In 1596 he published his "Cosmographical Mystery" — *Mysterium Cosmographicum* — containing the first of these conjectures, that the orbits of the planets corresponded to circles inscribed or circumscribed round one of the five regular solids. This theory of the order of the heavenly bodies was, of course, purely fanciful, and he was saved from further extravagance of this kind by his future connection with the celebrated astronomical observer, Tycho Brahe, at Prague.

In 1597 he made a foolish marriage with a young widow, and, in addition to pecuniary difficulties in which this involved him, he was obliged to retire into Hungary to escape from religious persecution. Though he was soon recalled to his professorship by the states of Styria, he did not occupy it long.

Tycho Brahe — probably the greatest of observers — whom he visited at Prague in 1600, induced him to become his assistant. When Kepler came to Prague in 1601, Tycho presented him to the emperor, who gave him the title of "imperial mathematician," on the condition of assisting Tycho in his calculations. Their first joint work was the computation of the "Rudolphine Tables," the expense of which was to be defrayed by Rudolph II., and hence named for him. Upon the death of Tycho in 1601, Kepler succeeded him as principal mathematician to the emperor, with a handsome salary, partly from the imperial treasury, and partly from the states of Silesia. He also inherited from Tycho his vast store of facts, and his habits of accurate and patient observation, without impairing the creative energy of his own master spirit.

In 1606 he published a "Supplement to Vitellio," in which he treats of the optical part of astronomy, and had very nearly stumbled on the law of refraction, afterward discovered by the Dutch mathematician, Snellius. In 1611 he published his *Dioptrics*, an admirable work, which laid the foundation of the science of optics. In this work he gives the theory of the telescope — describes the astronomical one with two convex lenses — expounds the spherical aberration of lenses, and the law of total reflexion at the second surfaces of bodies.

The work, however, on which his fame rests is his "New Astronomy, or Commentaries on the Motions of Mars," published in 1609. In this work he proves that Mars moves in an elliptical orbit, in one of the foci of which the sun is placed, and that the radius vector, or the line joining the planet and the sun, describes equal areas in equal times. These two great discoveries, the first made in physical astronomy, he extended to all the planets in the solar system, and it was through them that Newton, Hooke, Halley, and Wren independently arrived at the great law of the diminution of gravity with the square of the distance.

In the midst of the studies which led Kepler to these fine discoveries, he was harassed with pecuniary difficulties, which were the bane of his existence. His salary was ever in arrears, and the treasury of Rudolph was always empty. Upon the death of the emperor, however, in 1612, Kepler's arrears were paid. Matthias, the brother and successor of Rudolph, reappointed him imperial mathematician, and he was permitted to accept the professorship of mathematics at Linz, in Austria. He had lost his wife and one of his children by smallpox in 1611, and his family now consisted of a daughter born in 1602, and a son born in 1607. He married a second time in 1615, and added to his family three sons and two daughters, who, along with their mother, survived him.

About this time Kepler was summoned to the diet at Ratisbon, to give his opinion on the reformation of the calendar, a subject upon which he published a short essay. His pension was again in arrears, and in order to support his family he was obliged to compose what he calls "a vile prophesying almanac," which, he adds, "is scarcely more reputable than begging, unless from its saving the emperor's credit, who abandons me entirely, and would suffer me to perish with hunger."

In 1619 there appeared one of the most interesting of his works, entitled "The Harmonies of the World." It is dedicated to James I. of England, and is remarkable as containing his celebrated law that the squares of the periodic times of the planets are as the cubes of their distances. This law occurred to him on March 8, 1618, but from a blunder in his calculations he rejected it. Having discovered his error on May 15th, he recognized with transport the absolute truth of a principle which for seventeen years had been the object of incessant pursuit. He was almost frantic with joy. "The die is cast," he exclaimed, "the book is written to be read, either now or by posterity, I care not which. It may well wait a century for a reader, as God waited six thousand years for an observer." In the same year Kepler published the three first books of his "Epitome of the Copernican Astronomy," the fourth, fifth, sixth, and seventh appearing in 1622.

In 1620 Sir Henry Wotton, the English ambassador at Venice, visited Kepler while passing through Germany. He urged the astronomer to take up his residence in England, assuring him of a welcome and an honorable reception; but neither the welcome nor the reception, which is all the encouragement he would have received, would have released him from his pecuniary difficulties. "If the imperial mathematician, therefore," said Sir David Brewster, in his *Martyrs of Science*, "had no other assurance of a comfortable home in England than that of Sir Henry Wotton, he acted a wise part in distrusting it, and we rejoice that the sacred name of Kepler was thus withheld from the long list of distinguished characters whom England has starved and dishonored."

Notwithstanding his own pecuniary difficulties, the emperor Ferdinand, in 1622, ordered the whole of Kepler's arrears to be paid, including those due by Rudolph II. and Matthias I., and he supplied, also, the necessary funds for continuing the "Rudolphine Tables." The wars of the reformation, however, interfered with this and with every other peaceful pursuit. Kepler's residence at Linz was blockaded by the religious reactionaries, and his library sealed up.

It is too often forgotten that, while pursuing his purely scientific researches, Kepler was incessantly laboring at the practical business of his life, bequeathed to him by Tycho — the construction of astronomical tables. These appeared at last in 1627, with a long historical title-page, indicating the part which Tycho, Frederick II. of Denmark, three successive emperors of Germany, and finally Kepler himself had taken in their construction. Without the invention of logarithms, which Kepler eagerly adopted from Napier, these tables could hardly have been constructed; and they figure side by side with Kepler's ellipse and Galileo's telescope, in the allegorical frontispiece.

The grand duke of Tuscany sent him a gold chain in testimony of his approbation of this great work, and Albert Wallenstein, duke of Friedland, munificently invited him to reside at Sagan, in Silesia. With the emperor's permission he accepted this offer, took his family to Sagan in 1629, and by the duke's influence obtained a professorship in the university of Rostock.

Finding it difficult in this remote locality to obtain payment of his imperial pension, the arrears of which were eight thousand crowns, he went to the imperial assembly at Ratisbon to obtain them. The vexation which the failure of this attempt occasioned, and the fatigue of his journey, threw him into a catarrhal fever, which was accompanied with an abscess of the brain, the result of excessive study. Medical skill failed, and he died on November 15, 1630, in his sixtieth year. His remains were interred in St. Peter's churchyard at Ratisbon, and on his tombstone was placed an inscription written by himself. This monument was destroyed in the wars which desolated Germany, and it was not until 1803 that the prince bishop of Constance erected a handsome monumental temple near the place of his interment, surmounted by a marble bust of Kepler.

This great man published no fewer than thirty-three separate works. His discoveries in optics, general physics, and geometry are numerous; but his fame rests chiefly on the discovery of three remarkable laws by which the movements of all the planets are explained. The first of "Kepler's laws," as they are called, is that planets move round the sun in ellipses or ovals, and not in circles; the second law is that planets describe equal areas about their center in equal times; and the third law is that the squares of the periodic times of the planets are proportional to the cubes of their distances. Even if Kepler had never turned his attention to the heavens, his optical labors would have given him high rank among the original inquirers of his age.

Kepler had a strong, though very vague, conception of planetary gravitation. "Gravity," he says, in the introduction to the work on Mars, "is a mutual tendency of similar bodies to unite. Heavy bodies do not tend to the center of the world, but to that of the spherical body of which they are a part. If the earth was not spherical, bodies would not fall vertically to its surface. If the earth and the moon were not kept at their respective distances, they would fall one on the other; supposing them of the same density, the moon would pass through fifty-three fifty-fourths of the distance, the earth through the remaining part." He attributed the tides also to their true cause — the action of the moon on successive points of the ocean as the earth rotated.

Between these floating conjectures and the solid ground of Newton's *Principia* there was a wide gulf which only the calculus of Leibnitz or Newton could bridge over. But they show the soundness of Kepler's scientific instinct. In the same work is to be found the earliest indication of the first law of motion: that a body unaffected by external force remains at rest or in uniform rectilinear motion.

The history of science does not present us with any discoveries more truly original, or which required for their establishment a more acute and vigorous mind. The speculations of his predecessors afforded him no assistance. From the cumbrous machinery adopted by Copernicus, Kepler passed at one step to an elliptical orbit, with the sun in one of its foci; and from that moment astronomy became a demonstrative science. The splendid discoveries of Newton sprang immediately from those of Kepler, and completed the great chain of truths which constitute the laws of the planetary system. The eccentricity and boldness of Kepler's genius form a striking contrast with the calm intellect and enduring patience of Newton. The bright spark which the genius of the one elicited was fostered by the sagacity of the other into a steady and enduring flame. Kepler's simple but solemn announcement that the two things which filled him with wonder — "the starry heavens above, and the moral law within" — will, in itself, long continue to impress his greatness upon the soul of the ages.

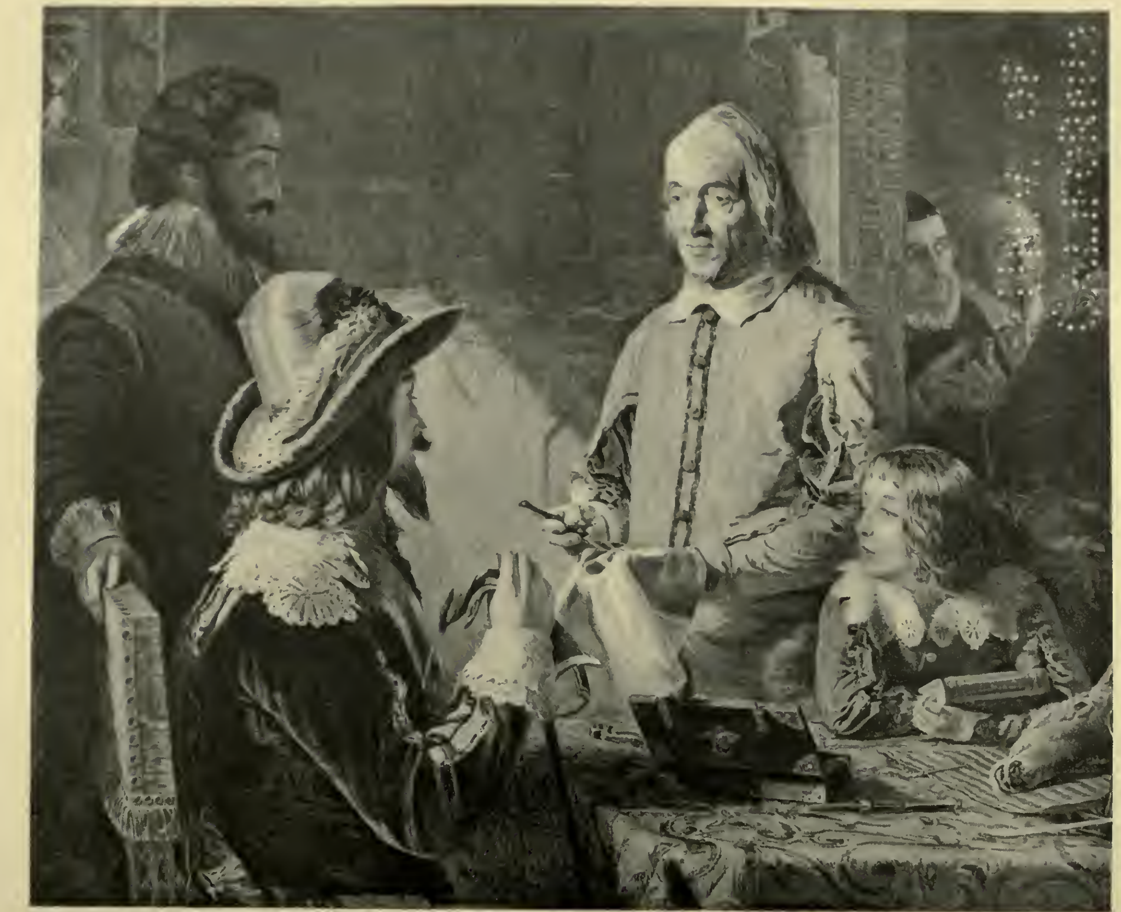
WILLIAM HARVEY, celebrated English anatomist, physiologist, and physician, and discoverer of the circulation of the blood, was born at Folkestone, England, April 1, 1578. He was the son of Thomas Harvey, a merchant of good repute, and Joan Halke. Five of his brothers followed merchandizing in the city of London, and the sixth was a member of parliament for Hythe.

After attending the grammar school at Canterbury, young Harvey in his sixteenth year entered Caius college, Cambridge, where he was graduated, B. A., in 1597. The following year he went to Padua, Italy, then the most celebrated school of medicine in the world, where he spent four years in preparation for his professional career. He studied at Padua under the noted Fabricius of Aquapendente, Julius Casserius, Galileo, and other eminent men, who then adorned that university, and received his diploma as doctor of medicine in 1602. Returning to England in the same year, he obtained also a doctor's diploma from his *alma mater*, Cambridge university.

It is frequently noted that in his subsequent discoveries Harvey owed a large debt to the distinguished Fabricius, who discovered the valves in the veins, favoring the flow of blood in a special direction. Galileo's lectures at Padua, on motion and mechanical force, were at that time also revolutionizing thought on all physical questions, and it is not likely his influence was totally lost on Harvey's keen intellect.

In 1604, when twenty-six years of age, he married the daughter of Dr. Lancelot Browne; and, entering his name on the list of candidates for a fellowship in the college of physicians, he settled to the practice of medicine in London. In 1609 he was appointed physician to St. Bartholomew's hospital, and



HARVEY DEMONSTRATING THE CIRCULATION OF THE BLOOD TO CHARLES I.

From the painting by R. Hannah

devoted himself assiduously to his professional duties. His rise to distinction appears to have been rapid, for we find him, after no very protracted practice, in the position of physician to many of the foremost men of the age — among whom were the earl of Arundel, Lord Chancellor Bacon, and others of distinction. In the year 1615 Harvey was chosen lecturer on anatomy and surgery to the college of physicians, on the foundation of Dr. Richard Caldwell; and from this year dates the most important period in his career. Shortly thereafter he began to give oral expositions of his views on the action of the heart and the motion of the blood through all parts of the body in a continuous circle. It was not, however, until much later that he gave wider publicity to his discoveries by his *Exercitatio de Motu Cordis et Sanguinis*, at Frankfort-on-the-Main in 1628.

Up to this time the views of Harvey were probably unknown beyond the sphere of his own immediate influence. There was no stir in the anatomical world about the circulation of the blood, and no notice of Harvey as an innovator until after the publication at Frankfort. Shortly after that event, however, there is evidence that the subject was attracting the notice of anatomists; and various dissertations in contravention of his views began to make their appearance on the continent of Europe.

At home he had no public opponent; but his opponents there had their revenge in another way, by questioning his skill as a practitioner; so that he complained to his friend and contemporary, Aubrey, that "after the coming out of his book his practice had greatly declined."

It is important here to observe that the conclusions of Harvey, of course, took the professional world by surprise. Among his original opponents there is no hint at similar views already entertained by others. Differing entirely from current and long accredited notions, Harvey's inferences were at first simply rejected, and rejected by all the authorities of continental Europe with singular unanimity; his merit as a discoverer in contrast with others was not even made the subject of discussion. It is only later, when the possibility of the truth of Harvey's discovery was dawning on men's minds, that envy began to see things in the writings of older anatomists which had never been seen there before, and which, with the new interpretation, went to rob Harvey of almost all merit as a discoverer. The works of Realdus Columbus, Cesalpino, and Servetus were now declared to contain enunciations of the circulation of the blood — of the lesser circulation at all events, if not of the greater — and, strange to say, it was not until the earlier half of the nineteenth century that it was conclusively shown, by immediate reference to the writings of these celebrated men, that they had in no instance conceived a circulation of the blood in the sense in which Harvey demonstrated and we now understand it.

Michael Servetus, it is true, in his *Restitutio Christianismi*, published in 1553, had described the circulation of the blood from the right side of the heart, through the lungs, to the left side. He knew the change of the color of the blood from dark to bright red that took place in the lungs; he knew also that in the act of expiration the blood was purified from "fuliginous vapors." Realdus Columbus in 1559, and after him Cesalpino of Arezzo, Galileo's first teacher, by careful study of the valves of the heart, had shown that the course of the pulmonary circulation must be as Servetus had stated. Cesalpino went so far as to conjecture that by the great artery (aorta) and its branches bright blood passed to all parts of the body; and that in the veins the passage was not from the main trunk to branches, but from branches to trunk.

But, in the first place, these views, especially as regarded the systematic, or general circulation, were conjectural only, and were complicated with erroneous views as to the relations of the heart and liver. Secondly, what is far more important, neither these great anatomists, nor any one else, had any conception of the muscular contraction of the heart as the mechanical force that impelled the blood. They were still under the full dominion of metaphysical fancies as to motion being naturally in circles, and as to the effervescing spirits which caused the heart, in its diastole, to swell and so attract the blood; whereas, in systole, the heart collapsed, when the body drew from it a supply of nutriment. Harvey showed for the first time that the periods of activity and rest were exactly the reverse of what had been thought; that the energy of each chamber of the heart was exerted in contraction. Combining the researches of his predecessors, and availing himself of the discovery of Fabricius as to the valves of the veins, he showed the precise manner in which the machine worked. It was the first introduction into biology of the laws of mechanical science.

Harvey's title of his great work gives the key to the right understanding of the vital points of his system. It is not an exercise on the circulation of the blood, but an "Exercise on the movement of the Heart and Blood": the action of the heart has precedence, as of right, over the motion of the blood. The action of the heart once understood, the double circulation of the blood through the lungs, and through the body at large, follows as a necessity from the arrangement of the wonderful valvular apparatus of the propelling organ.

Though his scientific inquiries may have interfered with his popularity, and led to the decline of his general practice, Harvey seems to have made steady way with the court and the great world. Three years after he had been made lecturer to the college of physicians, he was chosen one of the physicians extraordinary to James I., and in 1623 received promise of the office of physician-in-ordinary on the first vacancy. To this latter dignity he attained about 1632, but it was after the death of James and when his son Charles I. had already occupied the throne for several years. The treatise on the heart and blood was dedicated to Charles, who took such a decided interest in the studies of his physician as to have commanded a demonstration of the matters in question in his presence. Charles also most liberally furnished Harvey from the royal parks with the does which he required in the observations he was now pursuing upon the subject of generation.

Harvey's position as physician to the court had led in 1630 to an engagement as medical attendant on the young duke of Lennox in his travels on the continent of Europe, in the course of which Venice and the north of Italy were visited. In 1636 we again find Harvey in the suite of the earl of Arundel in his extraordinary embassy to the emperor of Germany, during which journey he publicly demonstrated, in the city of Nuremberg, to the celebrated anatomist, Caspar Hoffmann — one of the chief opponents of his views — the anatomical particulars and necessary conclusions of his theory. This demonstration, it seems, was absolutely conclusive to all present except Hoffmann himself, who still continued to urge futile objections.

Charles I., now having in 1640 brought political matters to a crisis between himself and his people, the standard of despotic power on one hand, and of parliamentary and constitutional government on the other, was unfurled, and the battle of Edgehill was fought in 1642. At this conflict Harvey was present; and during the fight, according to Aubrey, the prince and duke of York were committed to his care. Charles continued to have his headquarters at Oxford for several years after the battle of Edgehill, and Harvey remained with him; and, besides his court duties, began those studies which seem for many years to have absorbed a large share of his attention. Oxford university conferred upon him its honorary degree of doctor of physic; and, in 1645, by order of the king, he was made warden of Merton college, an office which he did not long retain, for, in July, 1646, Oxford surrendered to the parliamentary party, and he returned to London.

Harvey was now sixty-eight years of age, and seems to have withdrawn himself from practice, and from all further participation in the fortunes of his royal master. Indeed, he seems not to have resided constantly in London, but to have spent much of his time at the houses of more than one of his brothers in the country. Through his very lucrative practice before the civil war broke out, he accumulated a fund which grew so fast under the prudent management of his brother, Eliab, the city merchant, that at his death Harvey was worth more than one hundred thousand dollars, a very ample fortune in those days. In retiring from public life, however, he did not by any means abandon himself to idleness. He had long been engaged in the study of the difficult subject of generation, and, in 1651, at the especial instance of Dr. Ent, by far the most bulky of his works — "Exercises on Generation of Animals" — was given to the world.

Ent's account of his interview with Harvey on the occasion of his obtaining this work for publication is extremely interesting, and brings us face to face with the great anatomist, whose language to Ent is highly imaginative as he refers to the troubles he had brought upon himself by the publication of the "Exercise on the Heart."

"Would you be the man," he exclaimed to Ent, who was pressing him to share with the world some further fruits of his ingenuity, "Would you be the man to have me quit the peaceful haven where I now pass my life, and launch again upon the faithless sea? You, who know well what a storm my former lucubrations raised! Much better is it, oftentimes, to grow wise at home than by publishing what you have gathered with infinite pains, to stir up tempests that may rob you of peace and quiet for the rest of your days." Ent, nevertheless, succeeded in overcoming the objections of the scientist, and carried off the MS., comparing himself to a second Jason laden with another golden fleece, and engaging to perform the midwife's part in ushering the work into the world.

The scope and character of the work on "Generation" were of themselves guarantees that Harvey would not be disturbed by the cavils and objections of ill-informed and speculative opponents. Here he offended no accredited ideas, came in rude contact with no foregone conclusions by his observations. It contained, like his first work, a mass of original and carefully classified observations on human beings and animals, but was less fertile in immediate discovery. But it continued, with alternate strivings of the positive and metaphysical spirit, the researches of Aristotle, and it fills a most important place in the history of embryology. His striking generalization, *Omne vivum ex ovo*, though not true absolutely, shows most prescient insight into the process of organic evolution.

The work on generation, then, does not appear to have made any stir in the world of science; but that it enhanced its author's reputation among his contemporaries is unquestionable. Harvey was, in fact, now looked up to by common consent as the most distinguished anatomist and physician of his age, and, soon after the publication of the work in question, the college of physicians decreed him a statue to be erected in their hall, where, with a suitable inscription on its base, it stood until the great fire of 1666 desolated London.

From this period on to the time of his death, the chief object which occupied his mind was the welfare and improvement of the college of physicians. He built, furnished, and endowed a handsome library for this institution at his own expense, but his name did not even appear in connection with the gift; the inscription round the cornice merely announced that the building was erected under the auspices of Dr. Prujean, the president of the year.

Harvey preserved his mental activity and vigor to the very end of his life. His letter to Clegel of Hamburg, written in his seventy-fifth year, has all the perspicuity and force of a much younger man's production. In 1654 he was elected, in his absence, president of the college, but he declined the office on account of his age. In July, 1656, he resigned his Lumleian lectureship, which he had held for more than forty years; and, in taking leave of the college, presented to it his patrimonial estate at Burmarsh, in Kent, then valued at fifty-six pounds per annum. He did not long survive, but, worn down by repeated attacks of gout, he died at London on June 3, 1657, and was buried in a vault at Hempstead, in Essex, which his brother Eliab had built.

Aubrey, Harvey's chief biographer, has left us the following graphic description of him: "In person, he was of the lowest stature, round-faced, and with an olivaster complexion. He had little eyes, round, very black, and full of spirit. His hair was black as a raven. In temper, he was very choleric, and in his younger days he wore a dagger, as the fashion then was, which he would be apt to draw out upon every occasion."

Harvey, however, was unquestionably of a most placable and amiable disposition. With his own family he lived on terms of entire intimacy, and he was universally beloved and honored among his professional friends. He seems to have been entirely free from all love of ostentation. He was fond of meditation and retirement; and there is much in his works to characterize him as a man of warm and unaffected piety.

With the ancient philosophers he appears to have regarded the universe and its parts as existing by the will, and actuated by the power, of a supreme and all-pervading intelligence. In this he seems to have anticipated the celebrated philosopher, Schopenhauer — without, however, the latter's pessimism. He was a great admirer of Vergil, whose works were frequently in his hands, and whose religious philosophy he appears also in a great measure to have adopted, though upon the purely deistic notions of cultivated antiquity he undoubtedly engrafted a special faith on the Christian dispensation.

It is impossible to overestimate the influence which Harvey's induction has had on the progress of physiological knowledge, and on the science, as contrasted with the empirical practice, of medicine. He was universally inquisitive into natural things and natural phenomena, and his industry in collecting facts and recording them was unwearied. He was the first English comparative anatomist; that is, he was the first physiologist that country produced whose superiority of mental endowment led him to perceive the relations between the lowest and the highest organized beings, and who made the simplicity of structure and function in the one the means of explaining the complexity of structure and function in the other. The great British physiologist of the nineteenth century, Hunter, had certainly a herald in the great comparative anatomist and physiologist of the seventeenth century. "Had anatomists," says Harvey, "only been as conversant with the dissection of the lower animals as they are with that of the human body, many matters that have hitherto kept them in a perplexity of doubt would in my opinion have met them freed from every kind of difficulty."

Aubrey mentions particularly Harvey as having often said that, of all the losses he sustained, no grief was so crucifying to him as the loss of his papers containing notes of his dissections of many of the lower animals, which, together with his goods in his lodgings at Whitehall, were plundered at the beginning of the rebellion. But these notes on comparative anatomy were not the only loss; the "Medical Observations," or "Medical Anatomy," perished at the same time, a great work still more to be regretted, in which Harvey himself informs us that he intended, from the many dissections he had made of the bodies of persons worn out by serious and strange affections, to relate how and in what way the internal organs were changed in their situation, size, figure, structure, consistency, and other sensible qualities from their natural forms and appearances. For even as the dissection of healthy bodies contributes essentially to the advancement of philosophy and sound physiology, so does the inspection of diseased and cachectic subjects powerfully assist philosophical pathology.

This is precisely the system which the celebrated Morgagni — founder of pathological anatomy — pursued, and it is still the grand business which the most illustrious among modern pathologists are striving to extend and perfect.

SIR ISAAC NEWTON, one of the most celebrated mathematicians and natural philosophers, was born at Woolsthorpe, near Grantham, in Lincolnshire, England, December 25, 1642. His father, also Isaac Newton, was a farmer and small landed proprietor of Lincolnshire, who married Hannah Ayscough, and died a few months after his marriage. Young Newton was then a posthumous child, and, during his earliest years, was of very delicate physical constitution. For three years his mother watched over him with great maternal anxiety, when she married Rev. Barnabas Smith. In consequence of this marriage, the boy was then left under the care of his grandmother, who had general oversight of his youthful education.

Newton, at the age of twelve years, attended Grantham grammar school, but he was slow in book learning, and much absorbed in mechanical contrivances, windmills, water-clocks, carriages, and paper kites; and among his early tastes may be mentioned his love for drawing and writing verses, in neither of which he was destined to excel.

On the death of his stepfather in 1656, his mother returned to Woolsthorpe with her children; and Isaac, who was now in his fifteenth year, was recalled from school to assist in the management of the farm. At this, however, he was far from a success. While he was occupied with his books, models, water wheels and dials, the business of the farm was neglected, and the cattle were luxuriating among the corn. When he thus demonstrated his unfitness for the business of a farmer, he was sent back to Grantham school, where he made a distinguished record for himself, and finally stood at the head of the school in scholarship. On June 5, 1661, when nineteen years old, he was admitted subsizar at Trinity college, Cambridge but was somewhat unprepared for its course of instruction by his preliminary mathematical studies. He had been disposed to undervalue ancient geometry, and afterward confessed to Dr. Pemberton that he had applied himself to the works of Descartes and others before he had sufficiently considered the *Elements of Euclid*. He now devoted himself eagerly to mathematical study, and within a very few years not only made himself master of most of the works of any value on such subjects then existing, but also made marked progress in the methods for extending that science. In 1663 he invented what is now known as the binomial theorem. In April, 1664, he was elected to a scholarship. He took his degree of B. A. in January, 1665, was elected major fellow in March, and took his degree of M. A. in July, 1668.

In May, 1665, it appears that Newton committed to writing his first ideas on fluxions, or the calculus — that subject which subsequently gave rise to so extensive a controversy with Leibnitz. In 1666, having procured a prism, he discovered the unequal refrangibility of light, and the true doctrine of colors, and, having drawn the erroneous conclusion that the improvement of the refracting telescope was impossible, he set himself to the construction of a reflecting telescope. While thus occupied he was driven from Cambridge by the plague in 1665, and went to Woolsthorpe, where the fall of an apple, as he sat in his garden, suggested to him the most magnificent of his subsequent discoveries — the law of gravitation.

On his first attempt, however, by means of the law so suggested to his mind, to explain the lunar and planetary motions, he employed an estimate then in use of the radius of the earth, which was so erroneous as to produce a discrepancy between the real force of gravity and that required by theory to explain the motions. He accordingly abandoned the hypothesis and returned to his inquiries into the application of fluxions, and to the construction of a small reflecting telescope, which latter he completed in 1668.

In 1669 Newton was appointed to the Lucasian chair of mathematics at Cambridge, on the resignation of Dr. Barrow, and from this time we may date the commencement of his great discoveries. In 1672 he was elected a member of the royal society, and his first communication to that body was a description of a second reflecting telescope, which excited great interest in England and abroad. The telescope itself was sent to the society in December, 1671, "for his majesty's perusal." In January, 1672, he announced to the secretary, Oldenburg, a philosophical discovery which he considered the boldest if not the most considerable detection hitherto made in the operations of nature. This was the discovery of the composition of light, which was read to the society on February 8, 1672, and which led him into interminable controversies with Hooke, Huygens, and several other eminent scientific investigators. These controversies embittered his peace, and led him to resolve to have nothing more to do with that litigious lady, philosophy.

In 1673 he was disappointed in a competition for a law fellowship, then vacant at Cambridge — a disappointment increased by the fact that he was about this time in such wretched financial circumstances as to be unable to afford the weekly payment to the royal society, which "excused him." Very soon afterward, however, when his fellowship was about to expire, he obtained permission from the crown to hold the Lucasian chair along with a fellowship, without being obliged to take orders in the church. In 1675 Newton read before the royal society a dissertation on colors, which contained fuller details on the composition and decomposition of white light, and a new hypothesis concerning colors, with some proposition explaining the colors of thin transparent plates, and their relation to the colors of natural bodies. This again brought Newton into a controversy with Hooke, but, notwithstanding the interruption, he was soon occupied with those profound studies, the results of which were afterward set forth in his immortal work, the *Principia*.

He had long since deduced from the laws of Kepler the important law that gravity decreases with the square of the distance, a law to which Sir Christopher Wren, Halley, and Hooke had all been led by independent study. No demonstration of it, however, had been given, and no proof obtained that the same power which made the apple fall was that which retained the moon and the other planets in their orbits.

Adopting the ordinary measure of the earth's radius, Newton had been led to the conclusion that the force which kept the moon in its orbit, if the same as gravity, was one-sixth greater than that which was actually observed, a result which perplexed him, and prevented him from communicating to his friends the great speculation in which he had engaged. In 1682, however, he had heard of Picard's more accurate measure of the earth's diameter, and, repeating with this measure his former calculations, he found to his extreme delight that the force of gravity by which bodies fall at the earth's surface, four thousand miles from the earth's center, when diminished as the square of two hundred forty thousand miles, the moon's distance, was almost exactly equal to that which kept the moon in its orbit. Hence it followed that the same power retained all the other satellites round their primaries and all the primaries round the sun.

When Dr. Halley visited Newton at Cambridge in 1684, the former learned from him that he had surmounted the difficulties of the planetary motion, and promised him a treatise he had written on the subject. This treatise, *De Motu Corporum* — which was the germ of the *Principia* — was after some delay completed, and presented to the royal society in 1686. It was subsequently made the first book of the *Principia*. The second book was sent to the society in March, 1687, the third on April 6th, and the whole work published at the expense of Dr. Halley about midsummer of that year.

It has been already noted that Newton's alleged discovery of fluxions, or calculus, led to an embittered controversy between Newton and Leibnitz, as to the priority of the discovery. The verdict of the impartial historian of science to-day is that the methods were invented quite independently. It is admitted now that Newton made his discovery prior to that of Leibnitz, but no description of Newton's fluxions was published until 1693. The letters of Leibnitz show that he had invented his differential and integral calculus in 1675; and a full account of it was published in the *Acta Eruditorum* at Leipzig, 1684. It must be further admitted that the differentials and integrals of Leibnitz proved more fertile in the subsequent development of mathematics than the fluxions and fluents of Newton.

But it fell to the lot of Newton to combine the discovery of the calculus with what was by far the most important of its applications. And hence it is that the *Principia*, notwithstanding the archaic form into which he thought fit to transpose his discoveries, will by many be looked upon as the greatest, and by all as one of the two or three greatest masterpieces of scientific intellect. In unity of purpose, though not in native power, it surpasses the work of Archimedes; in the importance of its application, though not in philosophic breadth, the *Mécanique* of Lagrange. There was only one solar system, as Lagrange himself observed, for man's intellect to master.

Shortly before the *Principia* was given to the public, Newton had been called to take an active part in defending the rights of Cambridge university against the illegal encroachments of James II. The conspicuous part which he had taken on that occasion procured him a seat in the convention parliament, in which he sat from January, 1689, to its dissolution in 1690. In 1696 he was made warden of the mint, and was afterward promoted to the office of master of the mint in 1699, an office which he held until the end of his life. He again took a seat in parliament in the year 1701, as the representative of his university, and in 1705 the honor of knighthood was conferred upon him by Queen Anne, at Trinity lodge, Cambridge.

Thus engaged in the public service, he had little time left for mere scientific studies — pursuits which he always held of secondary importance to the public duties in which he was engaged. In the interval of public duty, however, Newton showed that he still retained the scientific power by which his great discoveries had been made. This was shown in his solution of two celebrated problems proposed in June, 1696, by John Bernouilli, as a challenge to the mathematicians of Europe. A similar mathematical feat is recorded of him as late as 1716, in solving a problem proposed by Leibnitz, for the purpose, as he expressed it, of feeling the pulse of the English analysts.

When in parliament, Newton recommended

the public encouragement of the invention of a method for determining the longitude — the first reward in consequence being gained by John Harrison for his chronometer. He was president of the royal society from 1703 until his death, a period of twenty-five years, being each year reëlected. In this position, and enjoying the confidence of Prince George of Denmark, he did much toward the advancement of science. One of his most important works during this time was the superintendence of the publication of Flamsteed's "Greenwich Observations" — a task, however, not accomplished without much controversy and some bitterness between himself and that astronomer.

Newton continued to enjoy a regular and pretty equal state of health until he attained his eightieth year, when, having become subject to a urinary disorder, his health gradually declined. He presided for the last time at a meeting of the royal society on March 2, 1727, and died at Kensington on March 20th, in the eighty-fifth year of his age. His body lay in state for a time in the Jerusalem chamber, adjoining the house of lords, from whence it was conveyed to and interred in Westminster abbey, the pall being borne by the lord chancellor, two dukes, and three earls. In 1731 a magnificent monument designed by Kent, and sculptured by Rysbrack, was erected in the abbey at the expense of his relatives; and his statue by Roubillac was subsequently placed in Trinity college, Cambridge.

Besides the scientific works particularly mentioned, Newton published a treatise on *Universal Arithmetic*, on *Analytical Geometry*, and on *Optics*. His literary and theological works included a work on *Chronology*, *Observations on the Prophesies of Holy Writ*, and an *Historical Account of Two Notable Corruptions of Scripture*. These latter were published after his death in Sir David Brewster's *Memoirs of Newton*, and clearly indicate that he accepted the Arian view of Christian dogma. Prior to 1692 Newton was popularly known as an "excellent divine," and it is therefore probable that his posthumous papers were written in the prime of life at Cambridge.

At the time of his death Newton left a private fortune exceeding one hundred fifty thousand dollars, which was divided among his four nephews and four nieces — descendants of his mother's second marriage. He himself never married.

In stature Newton was below rather than above the middle height, and became somewhat corpulent as he advanced in age. Thomas Hearne, the antiquary, and a contemporary of his, speaks of him as "a short well-set man looking deep in thought and little inclined to conversation." His hair, which was abundant, turned grey before he was thirty, and late in life was completely white, giving him when divested of his peruke an extremely venerable appearance. His eye was bright and penetrating up to the latest years of his life. Conduitt informs us that "until his last illness he had the bloom and color of a young man, never wore spectacles, nor lost more than one tooth to the day of his death."

In his latter years Newton lived in handsome style in London, attended by a coterie of servants. He was extremely generous and liberal in the use of money, and for mere worldly wealth he had a supreme contempt. He entertained a very modest opinion of his own abilities, saying, when complimented on the extraordinary power of his mind, if he had done anything worthy of notice, and of service to the world, it was owing more to his industry and patience of thought than to any extraordinary sagacity. "I keep the subject constantly before me," said he, "and wait until the first dawnings open slowly, by little and little, into a full and clear light." On one occasion, when his friends expressed their admiration of his splendid discoveries, he said, "I know not what I may appear to the world, but to myself I seem to have been only like a boy playing on the seashore, and diverting myself in now and then finding a smoother pebble or a prettier shell than ordinary, whilst the great ocean of truth lay all undiscovered before me."

When engaged in the solution of difficult problems, he was often so completely lost to the world as to forget the common concerns of life. He has been known to sit for hours on the side of his bed with his clothes half on and half off, absorbed in thought; at other times he has gone through the day without food, having forgotten the wants of nature, in the contemplation of some mathematical truth. His temper is said to have been so mild and equal that scarcely any accident could disturb it.

One instance in particular is mentioned of this disposition: he had a favorite little dog called Diamond, which, being left in his study, had overset a lighted candle among his papers, and burnt the almost finished labors of many years. This loss was irretrievable, yet the philosopher only exclaimed, "O Diamond! Diamond! thou little knowest the mischief thou hast done." His patience indeed may be said sometimes to have been carried too far; particularly in suffering other men to run away with the merit of his discoveries.

Although Newton was a profound thinker, at no time of his life was he a ready speaker. When he gave his evidence in 1714 before a parliamentary committee on the problem of finding the longitude at sea, it was said by Whiston, who was present at the time, that "what the rest had to say they delivered by word of mouth, but Sir Isaac Newton delivered what he had to say on paper." Nor was he a ready writer. "At no period of his life," says Brewster, "was he fond of writing letters, and least of all in his old age. He wrote scrolls of almost every letter he composed."

Like the great philosopher, Kant, he is also a remarkable instance of a distinguished man who never traveled. While in mind he surveyed the heavens and journeyed to the remotest stars, he traversed in body but a tiny portion of the earth.

It is a notable coincidence in the history of science, that the same year — 1642 — chronicled the death of Galileo and the birth of Newton. The circumstances with which the pursuit of truth in scientific matters was at this time surrounded, in the respective countries of these great philosophers, were not more different than the characters of the philosophers themselves. Galileo died a prisoner, under the surveillance of the inquisition, "for thinking, in astronomy," as Milton says, "otherwise than the Franciscan and Dominican licensers thought."

In England it had become the practice, and soon became the fashion through the influence of Bacon and Descartes, to discard altogether the dictates of authority in matters of science. The dispositions of the two philosophers were happily suited to the situations in which they thus found themselves. Galileo's was a mind whose strength and determination grew by the opposition it encountered. The disposition of Newton, on the other hand, diffident of the value and interest of his own labors, and shrinking from the encounter of even scientific controversy, might have allowed his most remarkable discoveries to remain in obscurity, had it not been for the constant and urgent solicitation of his friends that they should be published to the world.

In viewing the character and genius of this great man, it is not easy to determine whether sagacity, penetration, strength, or diligence had the greatest share in his composition. We hardly know whether to admire more the sublime discoveries at which he arrived, or the extraordinary character of the intellectual processes by which those discoveries were reached. "To the highest powers of invention," says Sir David Brewster, "he added, what so seldom accompanies them, the talent of simplifying and communicating his profoundest speculations. In the economy of her distributions nature is seldom thus lavish of her intellectual gifts. The inspired genius which creates is rarely conferred along with the matured judgment which combines, and yet without the exertion of both the fabric of human wisdom could never have been reared. Though a ray from heaven kindled the vestal fire, yet a humble priesthood was required to keep alive the flame."

In his speech, unveiling the statue of Newton at Grantham, Lord Brougham said: "The contemplation of Newton's discoveries raises other feelings than wonder at his matchless genius. The light with which it shines is not more dazzling than useful. The difficulties of his course, and his expedients, alike copious and refined for surmounting them, exercise the faculties of the wise, while commanding their admiration; but the results of his investigations, often abstruse, are truths so grand and comprehensive, yet so plain, that they both captivate and instruct the simple. Nor when we recollect the Greek orator's exclamation, 'The whole earth is the monument of illustrious men,' can we stop short of declaring that the whole universe is Newton's."

It has been said by others that the history of Sir Isaac Newton is also the history of science; yet the character of his life and work does not entirely exclude him from the category of men of letters. While his great book, the *Principia*, is written in Latin and treats of mathematics, its tremendous scope and magnificent revelations entitle it to be placed without incongruity among those works which, like *Paradise Lost* or the "Divine Comedy," have widened men's outlook into the universe.

Milton and Dante dealt with the spiritual order of creation, Sir Isaac Newton with the

material; yet to those who perceive an almost mystical significance in numbers — to whom the science of mathematics is, in a sense, a gateway to the unseen — the author of the *Principia* and of the treatise on *Optics* will seem scarcely less a teacher than the poets. His soul was childlike in the presence of mysteries to which he held one key. His bequests to posterity are, therefore, not only his stupendous discoveries, but the example of the scientific temper of mind which is positive rather than negative, and which seeks a spiritual order behind the veil of matter.

CAROLUS LINNÆUS is the usual Latinized name of CARL VON LINNÉ, the celebrated botanist and naturalist, and founder of the "Linnæan system" of botany. He was born in Rashult, province of Smaland, Sweden, on May 23, 1707. His father, Nils Linné, was a Lutheran minister, in straightened circumstances, and a collector of curious plants. His mother, Christina Broderson, was a daughter of the previous village pastor. Hence both parents were eager in their efforts to fit their son for a ministerial career.

Carl, however, showed little inclination toward a clerical life, and took infinitely more interest in his father's plants and garden, and the indigenous species of the neighborhood. He was then apprenticed to a shoemaker for a brief period, but his enthusiasm for outdoor studies, as well as the encouragement of Dr. Rothman, a physician, and friend of his father's, soon led him to devote himself almost exclusively to the physical sciences. Botany, which was then little cultivated in Sweden, more particularly engrossed his attention. He formed a small library of botanical works, and although unable to comprehend some of the authors he possessed, yet he continued to read them day and night. He even learned some of them by heart, and acquired, among his teachers and fellow scholars, the name of the "little botanist." Dr. Rothman aided him in a very practical way by taking him into his own house for a period, during which he instructed the youth in physiology, and likewise upon the right method of studying his favorite science of botany, according to the system of Tournefort. In 1727 Linnæus went to study medicine at the university of Lund, and was equally fortunate there in gaining admission into the family of Dr. Stobæus, professor of physics and botany. Here he pursued his botanical studies with great zeal, and, in the following year, he entered the university of Upsala, by advice of his friend, Dr. Rothman. At Upsala he was at first greatly disappointed, and his scanty means led him through miserable straits of poverty. He even mended his own shoes with the bark of trees, but followed his work of observing plants and insects with unflagging persistency.

In the autumn of 1729 a fortunate incident greatly relieved his impoverished circumstances, and forwarded his ambitions. While examining some plants in the university garden, he attracted the attention of one of the noted professors of the university — who subsequently proved to be the celebrated Dr. Celsius — who, after some inquiry into the nature and extent of the youth's botanical studies, received him into his own house and employed him to assist in a work on the plants mentioned in scripture, and to collect botanical specimens around Upsala.

Linnæus enjoyed great advantages in his new situation. He had the full use of an extensive library, rich in botanical works. He lived on most familiar terms with his patron, and was introduced by him to Dr. Rudbeck, the professor of botany, who, obliged by age to execute the duties of his office by deputy, in 1730 made Linnæus his assistant and associate in his work, and placed him in charge of the botanical collections. It was while discharging the duties of this position that he published his first scientific work, *Hortus Uplandicus*, in 1731.

The young man's reputation as a naturalist was now established in the university; and the royal academy of sciences at Upsala deputed him to make a tour through Lapland, with the sole view of examining the natural productions of that desolate region. He set out on horseback in May, 1732, with few encumbrances of any kind, and bearing all his baggage on his back. In the flower of youth, bold, enterprising, and in robust health, he was well adapted to traverse the wild countries of northern Sweden and Lapland, in which he met with a number of romantic and dangerous adventures. When in the districts of Pitea and Lulea, on the gulf of Bothnia, his life itself was endangered, the circumstances of which he has given in the following animated account:

"Several days ago the forests had been set on fire by lightning, and the flames raged at this time with great violence, owing to the drought of the season. I traversed a space, three-quarters of a mile in extent, which was entirely burnt, so that the place, instead of appearing in her gay and verdant attire, was in deep sable: a spectacle more abhorrent to my feelings than to see her clad in the white livery of winter. The fire was nearly extinguished in most of the spots we visited, except in ant-hills and dry trunks of trees.

"After we had traveled about half-a-quarter of a mile across one of these scenes of desolation, the wind began to blow with rather more force, upon which a sudden noise arose in the half-burnt forest, such as I can only compare to what may be imagined among a large army attacked by an enemy: we knew not whither to turn our steps. The smoke would not suffer us to remain where we stood, nor durst we turn back. It seemed best to hasten forward, in hopes of speedily reaching the outskirts of the wood; but in this we were disappointed. We ran as fast as we could in order to avoid being crushed by the falling trees, some of which threatened us every minute. Sometimes the fall of a huge trunk was so sudden that we stood aghast, not knowing whither to turn to escape destruction, and throwing ourselves entirely on the protection of providence.

"In one instance a large tree fell exactly between me and my guide, who walked not more than a fathom from me; but, thanks to God! we both escaped in safety. We were not a little rejoiced when this perilous adventure ended, for we had felt all the time like a couple of outlaws, in momentary fear of surprise."

In the space of five months Linnæus performed, mostly on foot, a journey of three thousand seven hundred ninety-eight English miles, and with the approach of winter he returned to Upsala. On that occasion he was admitted to membership in the Swedish academy, and received the equivalent of about fifty dollars for his expenses. The *Flora Lapponica* was the result of this journey. It was not published, however, until 1737.

Scarcely had Linnæus recovered from the fatigues of this tour through Lapland, when he again felt the pressure of poverty. He consequently began a course of lectures on the assaying of metals, but his success excited the jealousy of Dr. Rosen, the successor of Dr. Rudbeck, at Upsala, who insisted that, in conformity with the statutes, Linnæus should no longer be allowed to lecture. The authorities had no alternative except to enforce the statutes, and this severe blow deprived Linnæus of all present means of advancement. He then quitted Upsala and took up his residence at Fahlun, the capital of Dalecarlia, where he gave lectures on assaying to the copper miners of that district.

In 1735, having saved a small sum of money, he resolved upon another tour of travel, with the view to taking a medical degree at some foreign university. He directed his course first to Hamburg, then to Holland, and obtained the degree of M. D. from the little university of Harderwijk. In Holland he gained the friendship of Gronovius and the celebrated Dutch physician, Boerhaave, by whom he was strongly urged to settle in Holland, then in the height of its commercial prosperity. But Linnæus' mind was set upon returning to Sweden, where he had formed an attachment for the eldest daughter of Dr. Moræus, a physician at Fahlun.

Intending to pass homeward through Amsterdam, Linnæus obtained from Boerhaave an introduction to an eminent botanist, Dr. Burmann, with whom he resided for a short time. During his stay at Amsterdam he formed the acquaintance of George Clifford, a rich burgomaster, who had a magnificent countryseat and garden at Hartecamp, near Haarlem, and into whose services he now entered for several years, as director and naturalist. The *Hortus Cliffortianus*, a magnificent work, describes these collections. His entire period of residence in Holland he made in publications, the most important of which were the *Systema Naturæ*, containing his classification of animals, and the *Genera Plantarum*, in which the sexual system of plants was fully developed.

In 1736 Linnæus made a tour of England at the expense of Clifford, who wished him to inspect the gardens of that country, and confer with the most eminent English botanists of that time. The English professors were warmly attached to the system of Ray; but Dillenius, the botanical professor at Oxford, was so impressed with the talents of Linnæus that he urged him to take up his residence there, even offering to share the profits of his professorship with him. Professor Martyn of Cambridge, Miller, Collinson, and others gave him a most courteous reception, and he returned to Holland with very favorable impressions of the English scientists.

About the close of 1737, contrary to the wishes of Clifford, Linnæus left Hartecamp with the intention of returning to Sweden. His fame as a scientist was now thoroughly established. The regard in which he was held in Holland was probably best expressed by Boerhaave, practically on his deathbed. Before the time of Linnæus' intended departure from Leyden, Boerhaave became too ill to admit visitors. Linnæus was the only person in whose favor an exception was made, so that the dying physician might bid him an affectionate farewell. "I have lived," he said, "my time out, and my days are at an end; I have done everything that was in my power. May God protect thee! What the world required of me it has got; but from thee it expects much more. Farewell, my dear Linnæus."

When upon the point of leaving Leyden, Linnæus was attacked by illness; and upon his recovery he determined to visit France before his return to Sweden. At Paris he received great kindness from the famous French botanist, Jussieu; and also received the high compliment of being elected a corresponding member of the French academy of sciences.

In the summer of 1738 he embarked at Rouen for Helsingborg. Soon after his arrival in Sweden he established himself in Stockholm as a physician. Notwithstanding the fame he had acquired abroad as a naturalist, his early efforts to gain practice met with little encouragement. He met with so much opposition that he almost resolved to quit his native country. But by perseverance he worked his way into a highly reputable practice, and was fortunate enough to number the queen of Sweden among his clients. In 1739 he married Sara, the daughter of Dr. Moræus, to whom he had been so long attached. In the same year he contributed, with some other like-spirited persons, to form an academy of sciences at Stockholm, of which he was elected president.

The professional success of Linnæus did not lead him aside from his favorite studies, however; and he kept his eye steadily on the great object of his ambition, the botanical chair at Upsala. In 1741 he was appointed medical professor in that university, and soon entered into an agreement with Professor Rosen to allow him to perform the duties of the botanical chair, while his colleague lectured on physiology and other subjects. Before entering the duties of his professorship, he pronounced a Latin oration before the university, "On the Necessity of Traveling in our own Country." In 1747, in addition to his duties as professor of botany, he was also made archiater or rector of the university.

Linnæus was at last placed in the situation which of all things he had most coveted. The academical garden was soon laid out on a new plan. When he was appointed professor, it did not contain above fifty exotic plants. In 1748, six years afterward, he published a catalogue from which it appears that he had introduced eleven hundred additional specimens, besides most of the vegetable productions of Sweden itself.

He now applied to all his scientific correspondents for plants. In a letter to Albert Haller, he says, "Formerly I had plants, but no money; and now, of what use is my money, without plants?" His exertions so much extended the fame of the university that the number of students considerably increased, particularly during the time he held the office of rector. They came from Russia, Norway, Denmark, Great Britain, Holland, Germany, Switzerland, and even from America. He made summer excursions attended by his pupils, often to the number of two hundred. When some rare or remarkable plant or other natural curiosity was found, a signal was given by a horn, at which the whole party assembled round their leader to hear his analysis.

His pupils spread themselves over the globe; they carried everywhere with them the spirit of their master, and diffused the love of natural history. When Captain Cook's first voyage around the world was undertaken, one of Linnæus' most celebrated pupils, Dr. Solander, accompanied the distinguished English botanist and naturalist, Sir Joseph Banks. It was not, however, from his pupils alone that Linnæus received botanical information and help; in every part of the world persons were found anxious to forward specimens to him, and his collections thus became unrivaled.

The chief publication of Linnæus after his establishment at Upsala were his *Philosophia Botanica*, and *Species Plantarum*, in 1751 and 1753 respectively. Of these, the first is a collection of treatises on various subjects; the second is the foundation of the Linnæan system of botany, and from it, for a long time, many introductions to the study of botany were compiled. The latter is termed by Haller his "great and everlasting masterpiece."

The introduction of the Linnæan system was attended with such great change, especially of nomenclature, that it experienced considerable opposition from the older naturalists; and the biographers of Linnæus have recorded several literary feuds with distinguished contemporaries, and especially with Albert Haller, a genius of almost equal merit with himself. Even to-day he is commonly thought of as the constructor of the artificial system of classifying plants which bears his name, and is sometimes unfavorably contrasted with the constructors of the natural system. His *Systema Naturæ*, first published in 1735, and republished by him in successive editions until 1770, was a comprehensive survey of the "three kingdoms of nature, systematically arranged in classes, orders, genera, and species." In the formation of natural groups, very much had been done by Aristotle, and his work was carried on in the fifteenth and sixteenth centuries by Aldrovandus, Conrad, Gesner, and others; but the merit of first arranging these groups in orderly succession belongs to Linnæus.

Owing to the greater complexity of functions and organs in the animal kingdom, this process, especially the latter part of it, was far more possible with animals than with plants. Linnæus, in 1735, distinguished six subkingdoms: (1) quadrupeds, afterward called by him mammalia; (2) birds; (3) amphibia, in which reptiles were included; (4) fishes; (5) insects; (6) worms. Each was subdivided into orders. Mammals, e. g., were arranged in the following orders: (a) anthropomorpha or primates, including the genera man, ape, sloth; (b) feræ or carnivora; (c) glires or rodents; (d) jumenta, including horse, hippopotamus, elephant, and pig; (e) pecora or ruminants. In subsequent editions the scheme was somewhat modified, but it was not substantially altered until, at the close of the century, the invertebrate terms of the series received vast development under Lamarck. Linnæus made an attempt to illustrate the diminishing complexity of his descending series as shown in the structure of the heart and the respiratory system, an attempt renewed afterward in a far more effective way by Vicq d'Azyr and John Hunter.

In the vegetable kingdom, where the differentiation of organs is less conspicuous, Linnæus found the formation of natural groups, and especially an attempt at serial arrangement, to be impracticable. He constructed, therefore, the well-known provisional system which bears his name, based on a single character, the sexuality of plants, a character recognized vaguely by some previous botanists, as by Burkhard in 1702, and more explicitly by Vaillant, who died in 1722, to whom Linnæus freely owned his obligations. As a mode of orderly arrangement and simple nomenclature, the value of this artificial system to botanists has been incalculable. But Linnæus most emphatically maintained the necessity for a natural system based on no single character, but on the aggregate of real affinities, though he was not able himself to construct it.

The latter years of Linnæus were spent in a state of ease, affluence, and honor, very different from the poverty and obscurity of his early life. His fame increased, apparently, with his years, and his scientific connections and correspondence with foreign countries became very extensive.

In 1753 the Swedish sovereign, Gustavus III., bestowed upon him a most flattering mark of his regard, by creating him a knight of the polar star. This order had never before been conferred on any literary or scientific personage; nor had any person below the rank of a nobleman been honored with it. In 1761 the king issued a patent of nobility in his honor and thereafter he was Carl von Linné. He was made a member of the royal academy of sciences of Paris, of St. Petersburg, and of Berlin, and elected a fellow of the royal society of London. There was hardly a learned body in Europe that did not enroll his name among their numbers. A most flattering compliment was received from the king of Spain, who invited him to settle at Madrid, with the offer of an annual pension for life of two thousand pistoles, letters of nobility, and the free exercise of his own religion. He, however, did not accept this offer, and simply answered that, if he had any merit, his services were due to his own country.

In 1773 the reigning king of Sweden appointed him, in conjunction with others, to make a new translation of the Bible into the Swedish language. In May, 1774, while lecturing in the botanical garden of the university, he was attacked with apoplexy, the debilitating effects of which obliged him to relinquish the more active parts of his professional duties, and to close his literary career. In 1776 a second apoplectic stroke paralyzed his right side and impaired his mental powers. Even in this painful and miserable state the study of nature remained his greatest pleasure, and he was constantly carried into his museum to survey the treasures there accumulated. He died January 10, 1778, in the seventy-first year of his age.

His death threw a general pall of mourning over Upsala. A medal was struck upon the occasion, and a monument erected to his memory in the cathedral church of Upsala. The king of Sweden himself pronounced a panegyric on his distinguished subject before the royal academy of Sweden.

In person Linnæus is described as of medium height, with heavy limbs, piercing brown eyes, acute vision, and quick-tempered. He was accustomed to sleep five hours in summer and ten in winter. He lived simply, acted promptly, and noted down his observations at the moment. His handwriting was peculiar, and not very easy to read; copies of his own books were interleaved and copiously annotated, every new discovery being posted in its proper place at once, so that new editions were readily prepared when wanted.

Linnæus was one of those great men, who have shown by example how much the genius and activity of an individual are capable of accomplishing. He was the reformer of botany, and perhaps the greatest promoter of natural history that ever lived. So much, at any rate, has never been done for that science, in so short a space of time, as at the period in which he flourished, and immediately after. With him arrangement seems to have been a passion; he delighted in devising classifications; not only did he systematize the three kingdoms of nature, but even drew up a treatise on the *Genera Morborum*, or "Classification of Diseases." He found biology a chaos; he left it a cosmos.

When he appeared upon the scene, new plants and animals were in course of daily discovery in increasing numbers, due to the increase of trading facilities; he devised schemes of arrangement by which these acquisitions might be sorted provisionally, until their natural affinities should have become clearer. He made many mistakes; but the honor due to him for having first enunciated the true principles for defining genera and species, and his uniform use of trivial names, will last as long as biology itself endures.

His style is terse and laconic; he methodically treated of each organ in its proper turn; he had a special term for each, the meaning of which did not vary, so that the term did not suggest two ideas at once. The reader cannot doubt the author's intention; his sentences are business-like, and to the point. The omission of the verb in his descriptions was an innovation, and gave an abruptness to his language which was foreign to the writing of his time; but it probably by its succinctness added to the popularity of his works.

By his force of character he shifted the scientific center of gravity during his life to a small town in Sweden. He was constantly receiving presents and praise from crowds of correspondents in every civilized country, and in every station of life; hence it is not surprising that this universal homage should have bred the vanity which disfigures the latter part of his diary.

No modern naturalist has impressed his own character with greater force upon his pupils than did Linnæus. He imbued them with his own intense acquisitiveness, reared them in an atmosphere of enthusiasm, trained them to close and accurate observation, and then dispatched them to various parts of the globe. His students being drawn from many quarters, he had an extensive choice; some fell victims to fatigue and unkindly climates, but there was no lack of successors. With these young enthusiasts their master's lore was like a gospel; they were eager to extend the knowledge of it, and to contribute to its richness.

ARKWRIGHT

A. D.		AGE
1732	Born at Preston, England,	..
1750	Barber at Bolton Willows,	18
1760	Hair merchant and dyer,	28
1767	Constructed model of spinning machine,	35
1769	Obtained patent; erected first mill at Nottingham,	37
1771	Built mill at Cromford,	39
1775	Obtained second patent,	43
1785	Patent nullified,	53
1786	High sheriff of Derbyshire; knighted by George III.,	54
1792	Died at Cromford,	60

RICHARD ARKWRIGHT, inventor of the spinning frame, and founder of the factory system in manufactures, was born at Preston, Lancashire, England, December 23, 1732. He was the son of poor parents, and the youngest of thirteen children.

His early educational opportunities were exceedingly limited, and in his boyhood he learned the trade of a barber. About 1750 he seemed to have settled at Bolton Willows, or Bolton-le-Moors, near Manchester, and here pursued his trade up to 1760, when he invented a process for dyeing human hair. In that day, when wigs were general, this discovery was of considerable value, and in connection with it he traveled about collecting hair, and disposing of it again when dyed.

It is unfortunate that very little is known of the steps by which he was led to those inventions that raised him to affluence, and have immortalized his name. He resided in a district where a considerable manufacture of linen goods and of linen and cotton mixed was carried on. This contact gave him ample opportunities, it may be reasonably assumed, of becoming acquainted with the various processes that were then in use. If we add to this the fact that he was endowed with a most original and inventive genius, and had the sagacity to perceive what was likely to prove the most advantageous pursuit in which he could embark, his attention was naturally drawn to the employment of the method of spinning practiced in his neighborhood.

He stated that he accidently derived the first hint of his great invention from seeing a red-hot iron bar drawn through two pairs of rollers, the second pair moving more rapidly than the first. Between this operation and that of elongating a thread, as practiced in spinning, there is very little mechanical analogy; yet this hint suggested to Arkwright that cotton, when cleaned and carded, might be dealt with in the same way; and it ultimately produced an invention, which in its consequences has been a source of individual and general wealth almost unparalleled in the annals of the world.

The precise date of the discovery is not known, but it is most probable that the idea of spinning by rollers had occurred to Arkwright's mind as early as the period when Hargreaves was engaged in the invention of the spinning jenny in 1767. No previously invented machinery had been able to produce cotton thread of sufficient tenuity and strength to be used as warp. Hargreaves's invention had multiplied the spindles that a single workman could manage; but the yarn produced by it was soft, and could be used only for weft in conjunction with linen warps. An unsuccessful invention by Charles Wyatt of Birmingham, England, about 1738, deprives Arkwright, also, of the honor of having been the first to use rollers in spinning; but there is no reason to believe that he owed anything to this previous attempt.

On the principle mentioned, therefore, Arkwright, with the assistance of John Kay, a watchmaker of Warrington, whom he employed to work out the mechanical difficulties, completed his celebrated spinning frame — or at least a model of it — about 1767. Its paramount advantage was that by it several threads might be spun at the same time, and by one application of force, in the place of a single thread produced on the ordinary spinning wheels. The method by which he ultimately succeeded in doing this is thus described in Baines's *History of the Cotton Trade*, in a passage which renders the operation and the invention as clear as it can be made by a mere verbal description:

"In every mode of spinning, the ends to be accomplished are, to draw out the loose fibres of the cotton wool in a regular and continuous line, and, after deducing the fleecy roll to the requisite tenuity, to twist it into a thread. Previous to the operation of spinning, the cotton must have undergone the process of carding, the effect of which is to comb out, straighten, and lay parallel to each other its entangled fibres. The carding or sliver — as it is called — of cotton requires it to be drawn out to great fineness, before it is thin enough to be twisted into a thread.

"The way in which this is done, is by means of two or more pairs of small rollers placed horizontally — the upper and lower roller of each pair revolving in contact. The carding or sliver of cotton being put between the first pair of rollers, is, by their revolution, drawn through and compressed; while passing through the rollers, it is caught by another pair of rollers placed immediately in front, which revolve with three, four, or five times the velocity of the first pair, and which, therefore, draw out the sliver to three, four, or five times its former length and degree of fineness; after passing through the second pair of rollers, the reduced sliver is attached to a spindle and fly, the rapid revolutions of which twist it into a thread, and at the same time wind it up on a bobbin. That the rollers may take hold of the cotton, the lower roller is fluted longitudinally, and the upper is covered with leather.

"Such is the beautiful and admirable contrivance, by which a machine is made to do what was formerly, in all ages and countries, effected by the fingers of the spinner. It is obvious that, by lengthening or multiplying the rollers, and increasing the number of spindles, all of which may be turned by the same power, many threads may be spun at once, and the process may be carried on with much greater quickness and steadiness than by hand spinning. There is also the important advantage — the thread produced will be of more regular thickness, and more evenly twisted."

Such was Arkwright's machine, for which he obtained a patent in July, 1769, and from that day the subsequent rise and greatness of cotton manufactures dates. At this time Arkwright was so poor that he needed to be supplied with a suit of clothes before he could appear to vote at an election for burgess of Preston. Soon after, he removed to Nottingham to escape the popular rage of a Lancashire mob, such as had already driven out Hargreaves, and destroyed his machinery. Here his operations were at first greatly fettered by lack of capital; but he finally set up his first mill, on a small scale, and operated the machinery by horse power. This motive power proved too expensive; and then, in 1771, in association with two partners — Strutt, of Derby, an extensive stocking manufacturer, and Reed — he built a second mill at Cromford, near Matlock, in Derbyshire, the machinery of which was turned by the river Derwent.

Soon after the erection of this mill, Arkwright made many improvements in the mode of preparing the cotton for spinning, and invented a variety of ingenious machines for effecting this purpose in the most correct and expeditious manner, for all of which he obtained patents in 1775. He also formed other establishments, similar to the one at Cromford, in other parts of England and in Scotland. These produced for him and his associates prodigious fortunes for those times, and gave a wonderful impulse to the industry and productive power of Great Britain, as well as to other countries. The results of Arkwright's discovery were, however, multiplied a hundred fold by James Watt's not less wonderful improvement of the steam engine, which created a motive power of inexhaustible strength, and capable of being produced wherever fuel could be procured in sufficient abundance. Combined, these discoveries made Manchester, Glasgow, and Liverpool the greatest industrial and commercial cities of the eighteenth century.

The vast importance of the discovery for which Arkwright had taken out patents became very speedily known, and it is not surprising that every effort should have been made in the courts of law to have them set aside, and Arkwright deprived of the profit and honor to be derived from them. From both the employers of Lancashire and from the workmen he was compelled to meet opposition, and frequently open revolt. They entered into a combination not to buy his yarn. They strenuously resisted the reduction of the tax on cotton cloth. They allowed one of his factories at Chorley to be destroyed by a mob, in the presence of police and soldiers, without any attempt at interference. Lawsuit after lawsuit was brought against Arkwright's patent right; and to such an extent did other cotton spinners use his designs that he was obliged, in 1781, to bring legal action against nine different manufacturers.

The first action against Colonel Mordaunt, backed by a strong combination of Lancashire manufacturers, was lost solely on the ground that his description in his specification was not sufficiently clear and distinct. The other actions were abandoned; and, in the following year, Arkwright published a pamphlet containing a statement of his case. In a new trial in 1785 he obtained a favorable verdict. The whole question, however, was brought finally before the court of king's bench a few months after, when Arkwright's claim to the inventions patented was for the first time called into dispute. On the doubtful evidence of a person named Highs, or Hayes, combined with that of Arkwright's old assistant, Kay, the jury decided against him, and his patent was annulled. This was but the formal outcome of an opposition which had from the beginning marked out Arkwright as an object of hostility.

Fortunately, not for himself only, but for his country and the world, every corner of which is benefited by his inventions, the energy and good sense of Arkwright triumphed over all opposition. The same ingenuity and skill which had originally enabled him to invent his machine and get it introduced, likewise enabled him to overcome the various combinations with which he had subsequently to contend. Notwithstanding the nullification of his patent, Arkwright continued his prosperous career. Wealth flowed upon him with a full stream from his judiciously managed concerns; and at the time of his death the value of his property amounted to about half a million sterling, or two and a half million dollars. For several years he fixed the price of cotton twist, all other spinners conforming to his prices. In 1786 he was appointed high sheriff of Derbyshire, and, having presented an address of congratulation from that county to King George III. on his escape from the attempt of Margaret Nicholson on his majesty's life, Arkwright received the honor of knighthood.

When it is considered that for many years he was afflicted with a violent asthma, which was extremely oppressive, and sometimes threatened immediately to terminate his existence, his great activity and exertion must excite astonishment. For some time previous to his death he was rendered incapable of continuing his usual pursuits by a complication of maladies which at last deprived him of life at the Rock House, Cromford, August 3, 1792.

Arkwright's is the greatest name in textile industry; but it may also be interesting to take a quick glance at a few other aspects of this important form of human labor, leading up to the marvelous revolution effected in the eighteenth century. Spinning by the distaff and spindle is prehistoric. We cannot tell when it was that parallel vegetable fibres were first formed into a continuous thread by twisting; the drawing out of the thread and the twist being effected by a slender cylinder of wood, weighted with a central whorl of stone, rotated by the fingers, and then allowed to fall. Not merely does this primitive invention do, in its own slow way, all that can be done by the machines of our own time, but it surpasses them in delicacy and fineness. Linen yarn for the finest lace is still spun by the spindle, and surpasses the highest "counts" — that is, the slenderest threads — produced by the most elaborate machine. The spindle used for the yarn of the ethereal muslins of Dacca was hardly larger than a needle, kept steady by a slight pellet of clay; which, yet being too heavy for the fine thread, was supported by a socket of shell in which it revolved.

Leonardo da Vinci, regardful of the humblest forms of industry, is believed to be the first to improve the spindle by adding a flyer. Toward the end of the seventeenth century the spinning wheel, turning two spindles, and worked with a treadle motion, so that both hands were free, came into common use. Then came Hargreaves's spinning jenny, already referred to. Arkwright's invention followed; and immediately after it Samuel Crompton of Bolton combined many of the merits of Arkwright's and Hargreaves's machines in his "mule," capable of spinning a fine thread of great strength. When the mule, at first worked by hand, was made self-acting half a century afterward, spinning machinery in all its essential principles was complete.

In addition to the merit of inventing the spinning frame, Arkwright may also claim the merit of having invented and organized the factory system, which added immensely to the resources of the laboring classes, and enlarged the productivity, not only of wealth, but of intelligence and virtue.

The most marked traits in his character were his wonderful ardor, energy, and perseverance. He commonly labored in his numerous concerns from five o'clock in the morning until nine at night; and, when considerably more than fifty years of age, feeling that the defects of his education placed him under great difficulty and inconvenience in conducting his correspondence, and in the general management of his business, he encroached upon his sleep, in order to gain an hour each day to learn English grammar, and another hour to improve his writing and spelling.

He was impatient with whatever interfered with his favorite pursuits; and the fact is too strikingly characteristic not to be mentioned, that he separated from his wife not many years after his marriage, because she, convinced that he would starve his family by scheming when he should have been shaving, broke some of his experimental models of machinery. Arkwright was a severe economist of time; and, that he might not waste a moment, he generally traveled with four horses, and at a very rapid speed.

So unbounded was his confidence in the success of his machinery, and in the national wealth to be produced by it, that he would make light of discussions on taxation, and say that he would pay the national debt. His speculative schemes were vast and daring; he contemplated at one time entering into very extensive mercantile transactions, and buying up all the cotton in the world, in order to make an enormous profit by the monopoly. From the extravagance of some of these designs, his judicious friends were of the opinion that, if he had tried to put them into practice, he might have overturned the whole fabric of his prosperity.

But no man ever better deserved his good fortune, or has a stronger claim on the gratitude of posterity than Sir Richard Arkwright. His inventions opened a new and boundless field of employment; and while they conferred infinitely more real benefit on his native country than it could have derived from the absolute dominion of Mexico and Peru, they have been universally productive of wealth, prosperity, and many other forms of human benefit.

"It required," says Ure, "a man of Napoleonic nerve and ambition to subdue the refractory tempers of workpeople accustomed to irregular paroxysms of diligence, and to urge on his multifarious and intricate constructions in the face of prejudice, passion, and envy. Such was Arkwright, who, suffering nothing to turn aside his progress, arrived gloriously at the goal, and has forever affixed his name to a great era in the annals of mankind."

WATT

A. D.		AGE
1736	Born at Greenock, Scotland,	..
1755	Mechanical apprentice in London,	19
1756	Settled at Glasgow, Scotland,	20
1757	Mathematical instrument maker for university of Glasgow,	21
1759	Began his experiments with steam,	23
1763	First marriage,	27
1765	Invented condensing steam engine,	29
1769	Patented his engine,	33
1774	Partner of Boulton at Soho,	38
1775	Patent for his engine extended,	39
1782	Double-acting engine constructed,	46
1783	Discovered the chemical composition of water,	47
1784	Fellow of the royal society of Edinburgh,	48
1785	Fellow of the royal society, London,	49
1800	Retired from active business,	64
1806	LL. D. from university of Glasgow,	70
1808	Member French institute, London,	72
1819	Died at Heathfield, England,	83

JAMES WATT, a celebrated Scotch engineer and mechanician, and inventor of the condensing steam engine, was born at Greenock, on the Clyde, Scotland, January 19, 1736. His father, James Watt, was a merchant, ship chandler, and magistrate of Greenock, who had settled there after the confiscation of his land in Aberdeenshire during the civil wars. His mother was Agnes Muirhead, an intelligent woman, and said to be "bountifully gifted with graces of person as well as of mind and heart."

As a boy James had feeble health, and carried on his studies at home under the direction of his parents. His mother, to amuse him, encouraged him to draw with a pencil upon paper, or with chalk upon the floor, and he was supplied with a few tools from the carpenter's shop, which he soon learned to use with considerable expertness. The mechanical dexterity he acquired was the foundation upon which he built the speculations to which he owes his glory, nor without this mechanical training is there the least likelihood that he would have become the greatest improver, and practically the creator, of the steam engine.

Several remarkable instances of precocity are related of Watt. On one occasion, when he was bending over a marble hearth, with a piece of chalk in his hand, a friend of his father said: "You ought to send that boy to a public school, and not allow him to trifle away his time at home." "Look how the boy is occupied," replied the father, "before you condemn him." Though only six years of age, he was "trying to solve a problem in geometry." A still more wonderful story is told of the idle James watching the steam escaping from the teakettle. Let these pass for what they are worth; Watt's teakettle may be placed alongside the little hatchet of George Washington.

His early years were passed at Greenock, but from the age of fourteen he was often in Glasgow with his uncle, and read and studied much on chemistry and anatomy. Having finished his education at the grammar school of his native town, he received no further instruction. As with all distinguished men, his extensive after-acquirements in science and literature were entirely by his own self-culture.

In the year 1755 he went to London to place himself under a mathematical instrument maker, and, after acquiring such a knowledge of that profession as a year's instruction could give him, he returned to Glasgow in 1756, with the intention of carrying on his business there. He had not acquired, however, the privilege of so doing from a burgess, and the incorporation of trades prohibited him from establishing a shop within the limits of the city. The university of Glasgow thus became the sanctuary of Watt, and the academical authorities, having found for him a small shop within its walls, employed him in fitting up the instruments in the Macfarlane observatory.

These premises he occupied from 1757 to 1763; but they seem to have been badly situated for his business, for which, moreover, at that time there was but little room in Glasgow. Watt during those years was scarcely able to make a living. In 1763 he secured a place of business in the town, and after that he did somewhat better. Still, he had to eke out his livelihood by making or mending fiddles — which he was able to do, though he had no ear for music — or doing any mechanical job which came in his way. No work requiring ingenuity or the application of scientific knowledge seems to have come amiss to him.

At length, in 1767, he obtained a new and a more lucrative occupation. In that year he was employed to make the surveys and prepare the estimates for a canal projected to unite the Forth and the Clyde. This work could not be carried out at the time, because it failed to obtain the sanction of parliament; but Watt had now made a beginning as a civil engineer, and henceforth he secured considerable employment in this capacity. He made surveys for various canals, for the improvement of the harbors of Ayr, Port Glasgow, and Greenock, and for the deepening of the Forth, the Clyde, and other rivers.

One of the tasks committed to him was to decide whether a projected canal between the Firth of Clyde and the western ocean should be made by way of Crinan or of Tarbert; and the last — also the greatest — undertaking of this kind on which he was employed was a survey for a canal between Fort William and Inverness, a work which was subsequently executed on a greater scale by Telford. In his surveys he made use of a new micrometer, and of a machine, also of his own invention, for drawing in perspective — the latter of which appears to have been for several years, about this time, one of his sources of income. The reports which he drew up in the capacity of engineer are said to have been remarkable for perspicuity and accuracy.

Living in the college at Glasgow, in constant intercourse with the professors of the university, with access to books, and with much unemployed time on his hands — having, too, a great love of knowledge, and a lively interest in mechanical novelties — Watt had been a diligent student of science, and experimented in the application of science to the arts. As early as 1759 his attention had been directed to the capabilities of steam as a motive force by Robison, afterward professor of natural philosophy in the university of Edinburgh, who was then a student in Glasgow. It had occurred to Robison that steam pressure might be used to propel wheeled carriages; but it does not appear that either Watt or Robison attempted to carry out this idea. In 1761 or 1762, however, Watt made a series of experiments on the force of steam, using a Papin's digester. These do not seem to have led to any results; and it was not until the winter of 1763-64 that he began the investigations which ended in his improvement of the steam engine. During that winter a working model of the Newcomen engine, kept for the use of the natural philosophy class in the college, was sent to him to be put in repair. Watt quickly found out what was wrong with the model, and easily put it in order.

Watt was much struck with the contrivance, but he soon perceived defects in it which prevented it from becoming more generally useful. From that time he devoted himself to the improvement of this machine, directing his attention chiefly to the saving of heat in the production and condensation of steam. So much confusion seems to exist as to the actual achievements of Watt in connection with the steam engine that a brief review of his improvements will tend to a better understanding of his true place in the history of invention.

The Newcomen engine was still but little used, and only for pumping water out of mines. It was a cumbersome machine, and it required so much fuel that the expense of working it had restricted, and must always have restricted, its use. It was not a steam engine at all. It was worked by means of the atmospheric pressure, steam being only used in producing, by its condensation, a vacuum in a cylinder, into which — the vacuum made — a piston was depressed by the pressure of the air. The steam issuing from a boiler was admitted into the cylinder until it filled it, when the supply was cut off by a self-acting cock; and then the steam was condensed in the cylinder by means of a jet of water. The water so greatly cooled the cylinder that the greater part of the steam at each stroke of the piston was wasted in heating its walls; and, on the other hand, much of the injected water was heated to the boiling point, and gave off steam, which resisted the descent of the piston.

Watt found that about four-fifths of the steam, and consequently of the fuel, was wasted; and he saw that to make the machine work economically, two apparently incompatible conditions must be obtained — first, that the walls of the cylinder must constantly be of the same temperature as the steam which came in contact with them; and second, that the injected water must never be heated up to one hundred degrees, the boiling point *in vacuo*. He now experimented upon the conducting power of various substances, and made trial of a cylinder made of wood steeped in oil; but with this cylinder, though it cooled less rapidly than a metallic one, there was still far too much waste of steam. Constantly, from the end of 1763, occupied with the subject of steam, he at length, early in 1765, hit upon the expedient which solved all his difficulties — the separate condenser, an air-exhausted vessel, into which the steam should be admitted from the cylinder and there condensed. The separate condenser at once prevented the loss of steam in the cylinder which had arisen in the process of condensation; and there was no difficulty in keeping it cool, so as to prevent the undue heating of the injection water. He had now a perfectly economical engine on Newcomen's principle.

This was the condition of Watt's invention in 1765. But he did not rest content with this. He resolved to make steam his motive power. Closing the cylinder at both top and bottom, and connecting the piston with the beam, to which it was to communicate motion, by a piston rod passing through a stuffing box, he admitted the steam by suitable valves alternately above and below the piston, to push it downward and upward in turn; and this done, his invention was substantially complete. He had at last made a real steam engine, capable of being worked with a comparatively small expenditure of fuel, and of yielding any desired amount of power. He received a patent for his engine in 1769; and in 1775 parliament granted him a prolongation of it for twenty-five years. Comparing his invention with the atmospheric engine of Newcomen, it must be admitted that it is not without justice that the popular voice has awarded him the name of inventor of the steam engine.

The machine was still employed as a pump only, and surpassed that of Newcomen simply in its economy of fuel. The force applied was intermittent, ceasing at the end of the down stroke of the piston. It was unavailable for all purposes in which continuous force was required, such as mill work. Its direction was rectilinear, whereas for the purpose of turning machinery rotation round an axis was necessary.

Soon after perfecting his model, Watt formed a partnership with Dr. Roebuck, then of the Carron iron works, for the construction of engines on a scale adapted to practical uses; and a model was erected at Kinneil, near Borrowstounness, where Dr. Roebuck then lived. But Roebuck got into difficulties; and nothing further was done until, in 1774, Watt entered into a partnership with Matthew Boulton of Soho, near Birmingham, when, Roebuck's interest having been repurchased, the manufacture of the new engine was commenced at the Soho iron works.

In 1782 Watt invented his double-acting piston, which allowed the circular motion of the engine's beam, and thus rendered it adaptable to any system of machinery. Yet there remained the fact that from various causes the motive power, or the resistance to be overcome, would frequently vary. Unless absolute uniformity could be secured in the rate of evaporation, the supply of steam would not be uniform. Again, if at any moment a particular machine was brought to rest, or others previously at rest were set in motion, the work to be done by the driving shaft would diminish or increase, and the equability of the general motion be disturbed. To remedy this inconvenience, a valve called the throttle valve was placed in the steam pipe, controlling the amount of steam that passed through it. An extremely ingenious device, known as the governor, attached to the flywheel, was made to control this valve automatically. Two balls attached by jointed rods to a spindle round which they revolved, diverged by centrifugal force when the wheel moved more quickly, and thus by a system of levers partially closed the valve, diminishing the steam supply; when speed was slackened, then gravitation brought them nearer together, with the opposite result.

By the combination of these six distinct inventions — the condenser, the employment of steam above and below the piston, parallel motion, the crank, the flywheel, and the governor, which extended over the period from 1769 to 1785 — Watt's engine, beginning as a mining pump, became at last available for the most delicate as well as the most laborious form of industry: spinning the finest thread as surely as it forged a mass of iron. And to this must be added that Watt endowed it with the power of registering the precise amount of work done, not in every stroke merely, but in every part of the stroke. His steam indicator, an apparatus in which steam is admitted into a small cylinder, and presses against a spring attached to a pencil in contact with a moving roll of paper, has been found of use in recent investigations of heat as a motive power.

In 1783 Watt discovered the chemical composition of water, which is also claimed by some writers for Henry Cavendish, a noted English chemist and physicist. The terms which Watt applied to the chemical substances which unite to form water were phlogiston and dephlogisticated air; nevertheless, Dalton in his *Chemical Philosophy* did not hesitate to say that "the composition and decomposition of water were ascertained, the former by Watt and Cavendish, and the latter by Lavoisier and Meusnier." Many other chemical authorities, besides, divided the honor of the discovery between Watt and Cavendish.

After the formation of the partnership between Watt and Boulton, Watt removed to Soho, near Birmingham, where he was employed in the management of what is still one of the principal establishments in England for the construction of steam engines. The success of the engines, which were widely introduced, brought a like financial success to the works at Soho, and greatly enriched both partners. Watt remained an active partner with Boulton until the year 1800, and then gave up his extensive interest to his two sons. But his mind continued to be actively employed in scientific investigations for many years thereafter. He had been made a fellow of the royal society of Edinburgh, and of the royal society of London, respectively, in 1784 and 1785, and now he was honored with the degree of doctor of laws by the university of Glasgow in 1806, and as a foreign member of the institute of France in 1808. At the age of eighty-three a tranquil death ended his career at his home in Heathfield, near Birmingham, on August 25, 1819. His statue in marble — considered the masterpiece of the noted English sculptor, Chantrey, now adorns Westminster abbey.

Watt was twice married: first, in 1763, to his cousin, a Miss Miller, who died in 1773; and a few years later, soon after his removal to Birmingham, he married a Miss MacGregor of Glasgow. At his death no issue was left to him except one son, long associated with him in his business and studies, and two grandchildren by a daughter who predeceased him.

This truly great man may justly be placed high on the roll of those creative minds who have improved the condition of mankind by the application of science to the practical purposes of life. The work done by Gutenberg and Columbus was the foundation of the great industrial impetus of the renaissance. The work done by Arkwright, Watt, and Stephenson forms the foundation of the still greater industrial impetus of our time. It is this last movement which, in the life of England, created America, revived France, Germany, Belgium, and Italy, and extended a new impelling force to the entire civilized world.

But independent of his great attainments in mechanics, Watt was an extraordinary and in many respects a wonderful man. Perhaps no individual in his age possessed so much and such varied and exact information, had read so much, or remembered what he had read so accurately and well. He had infinite quickness of apprehension, a prodigious memory, and a certain rectifying and methodizing power of understanding, which extracted something precious out of all that was presented to it. His stores of miscellaneous knowledge were immense, and yet less astonishing than the command he had at all times over them. It seemed as if every subject that was casually started in conversation with him was that which he had been last studying and exhausting; such was the copiousness, the precision, and the admirable clearness of the information which he poured out upon it without effort or hesitation. Nor was this promptitude and compass of knowledge confined, in any degree, to the studies connected with his ordinary pursuits.

That he should have been minutely and extensively skilled in chemistry and the arts, and in most of the branches of physical science, might perhaps have been conjectured. It could not have been inferred from his usual occupations, however, and probably is not generally known that he was curiously learned in many branches of antiquity, metaphysics, medicine, and etymology; and perfectly at home in all the details of architecture, music, and law. He was well acquainted, too, with most of the modern languages, and familiar with their most recent literature. Nor was it at all extraordinary to hear the great mechanician and engineer detailing and expounding, for hours together, the metaphysical theories of the German logicians, or criticising the measures or the matter of the German poetry.

"It is needless to say," observes one of his biographers, "that with his vast intellectual resources, his conversation was at all times rich and instructive in no ordinary degree. But it was, if possible, still more pleasing than wise, and had all the charms of familiarity, with all the substantial treasures of knowledge. No man could be more social in his spirit, less assuming or fastidious in his manners, or more kind and indulgent toward all who approached him. His talk, too, though overflowing with information, had no semblance to lecturing, or solemn discoursing; but, on the contrary, was full of colloquial spirit and pleasantry. He had a certain quiet and grave humor, which ran through most of his conversation, and a vein of temperate jocularity, which gave infinite zest and effect to the condensed and inexhaustible information which formed its main staple and characteristic.

"There was usually a little air of affected testiness, and a tone of pretended rebuke and contradiction, which he used toward his younger friends, that was always felt by them as an endearing mark of his kindness and familiarity, and prized accordingly far beyond all the solemn compliments that ever proceeded from the lips of authority. His voice was deep and powerful; though he commonly spoke in a low and somewhat monotonous tone, which harmonized admirably with the weight and brevity of his observations, and set off to the greatest advantage the pleasant anecdotes which he delivered with the same grave tone, and the same calm smile playing soberly on his lips. There was nothing of effort, indeed, or of impatience, any more than of pride or levity in his demeanor; and there was a finer expression of reposing strength, and mild self-possession in his manner, than we ever recollect to have met with in any other person. He had in his character the utmost abhorrence for all sorts of forwardness, parade, and pretension."

Wordsworth, the English poet, referring to Watt, said: "I look upon him, when I consider both the magnitude and the universality of his genius, as perhaps the most extraordinary man that this country (England) ever produced."

LAVOISIER

A. D.		AGE
1743	Born at Paris, France,	..
1766	Received prize offered by French academy of sciences,	23
1768	Associate of the academy,	25
1769	Farmer-general of revenue,	26
1771	Married,	28
1774	*Opuscules Chimiques et Physiques,* "Physical and Chemical Essays,"	31
1776	Improved gunpowder; director of government powder mills,	33
1787	*Méthode de Nomenclature Chimique,* "Method of Chemical Nomenclature,"	44
1789	*Traité Élémentaire de Chimie,* "Elementary Treatise on Chemistry,"	46
1794	Guillotined at Paris,	51

ANTOINE LAURENT LAVOISIER, a celebrated French chemist, and the chief founder of modern chemistry, was born at Paris, France, August 26, 1743. His parents were in affluent circumstances, and he was given a careful education under his father's direction at the Collège Mazarin, in Paris, which he left with high honors. He early showed a decided inclination for the physical sciences; and before he was twenty years old had made himself master of the principles of mathematics, botany, and especially chemistry, under Lacaille, Jussieu, and Rouelle, respectively.

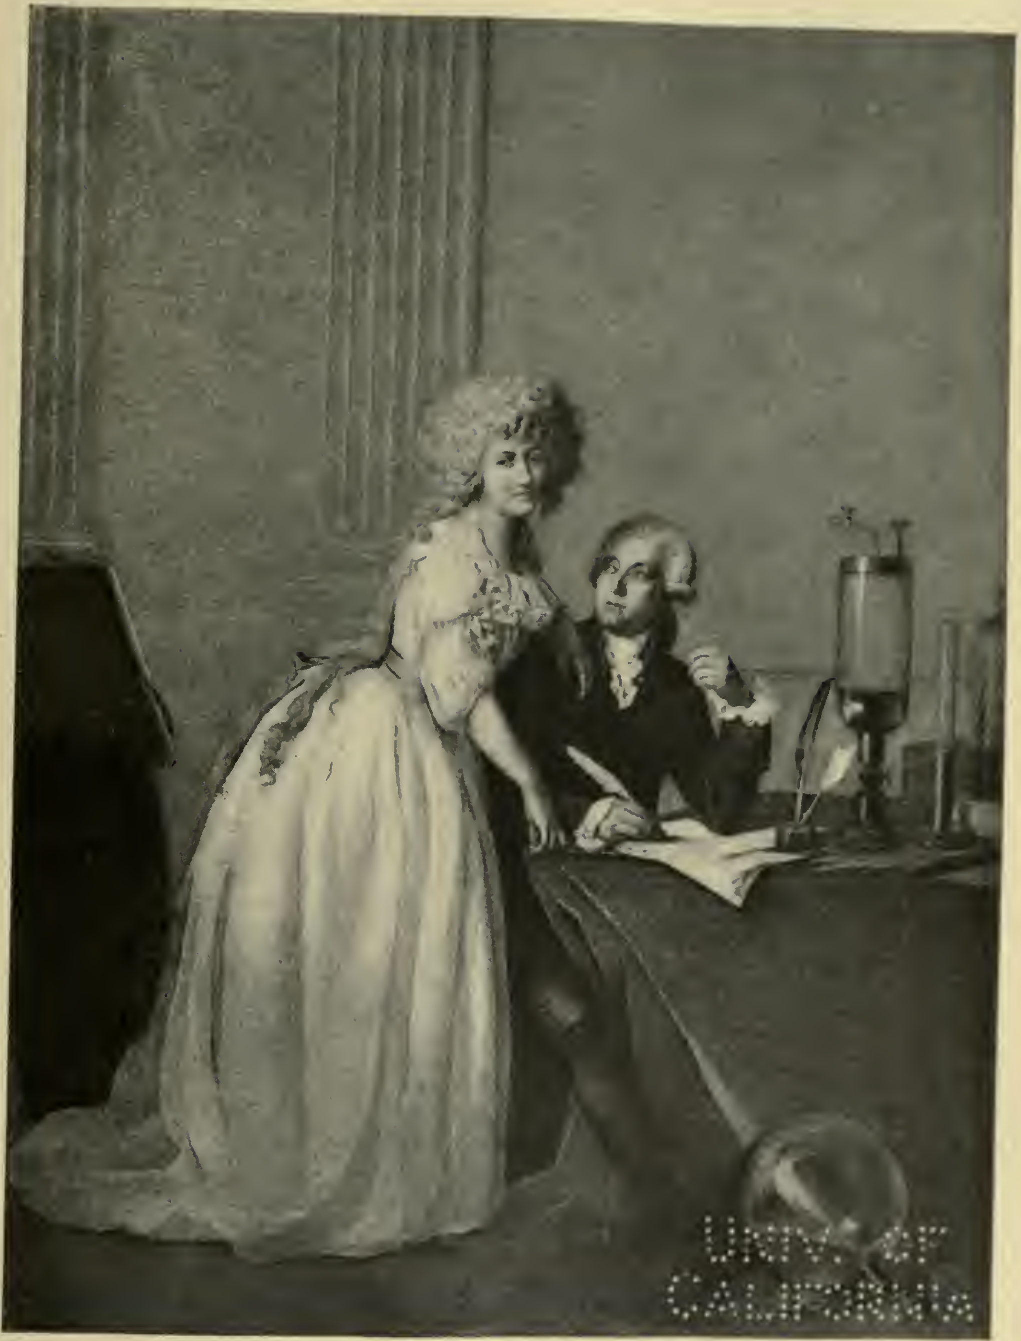
In 1764 the French government, through the academy of sciences, proposed an extraordinary premium for the best and cheapest means of lighting the streets of Paris, and other large cities. To this subject, involving a knowledge of several branches of science, Lavoisier immediately devoted his attention. He produced so able a memoir, full of most masterly, accurate, and practical views, that he was awarded the gold medal in 1766. This production was the means of introducing him into the academy of sciences, to which, after a severe contest, he was admitted to membership May 13, 1768; and he proved himself through life one of its most useful and valuable associates. He was in the following year appointed farmer-general of revenue.

Lavoisier began his scientific career by treating the whole subject of the sciences in the true spirit of the experimental method. First he clearly showed that the pretended conversion of water into earth was either a deposition of earthly particles, or a sediment arising from the action of the water on the internal surface of the retort. He also labored on the analysis of the gypsum found in the neighborhood of Paris, and on the crystallization of salts. He discussed the project of conveying water from L'Yvette to Paris, and the theory of congelation; and to these researches added extensive observations on the phenomena of thunder and the aurora borealis.

He next directed his attention more especially to mineralogy; and made excursions, in conjunction with Guettard, into all parts of France, endeavoring to form from different districts a complete collection of their characteristic mineral productions. He made advances toward a systematic classification of facts connected with the localities of fossils, which afterward served as the basis of his work on the revolutions of the globe and the formation of successive strata, of which two admirable abstracts were inserted in the memoirs of the academy of sciences for 1772 and 1787. Thus during the earlier part of his life Lavoisier does not seem to have devoted himself in particular to any one branch of science.

At this time the whole range of chemical and physico-chemical science was in an extremely imperfect state; and the first steps toward a more improved system involved the necessity of clearing away a vast mass of error which encumbered it. Particularly among the encumbrances was the great hypothesis of phlogiston. It was by overthrowing this, and putting in its place a new explanation of combustion, that he organized modern chemistry. Let us see how this hypothesis of phlogiston came about.

The awakening in favor of inductive science, which gave rise to the physical discoveries of Galileo and the philosophy of Bacon, led, in the seventeenth century, to the first attempts to raise chemistry to the rank of a science. Before this time, for a thousand years, the alchemists had sought in vain for a method of converting the baser metals into gold and silver. But this search, commenced by the Arabians, and introduced by them into Europe, and which produced such men as Geber, Raymond Lully, Roger Bacon, and Basil Valentine, gave to the world indirectly an immense number of facts, the organization of which afterward made chemistry. Then there came a transition period in which chemistry was identified with medicine, such as it was under Paracelsus and the celebrated



UNIV. OF CALIFORNIA

LAVOISIER AND HIS WIFE

From a painting by David

Van Helmont, who, at the beginning of the seventeenth century, roughly anticipated much of the pneumatic chemistry of Black, Cavendish, and Priestley.

But it was not until 1661, when Robert Boyle, the British chemist, published his *Sceptical Chemist*, that the science began. In this remarkable work he subjected to a rigid criticism the Aristotelian principles of earth, fire, air, and water, and the alchemical principles of salt, sulphur, and mercury, and showed that as ultimate elements they are entirely inadequate. He, at the same time, indicated indirectly what a chemical element should be. This put the science on a firm, independent basis, distinct from art of any kind and from biology. It led afterward to its final separation from physics. About this time the German physician and chemist, Becher, formulated the hypothesis of phlogiston, which was afterward applied and maintained by his great fellow countryman, Stahl. According to Becher and Stahl, when, for example, iron is converted into rust, it loses something — phlogiston. If, by means of some substance, such as charcoal, rich in phlogiston, the phlogiston be again added to the rust, it becomes phlogisticated rust, or metallic iron. A metal was a compound of its earth or calyx (oxide) with phlogiston, and calcination or combustion (oxidation) was the evolution of phlogiston.

The invaluable discoveries just alluded to — the existence of more than one species of gaseous matter — had opened a new world to the inquirer into nature; and the labors of those distinguished experimentalists had conspired to commence a fresh era in science. Lavoisier was one of the first to appreciate at once the importance of the results they had arrived at, and the immense field of further research to which those results had opened the way. He perceived by a sort of instinct the glorious career which lay before him; and the influence which this new science thus, as it were, created, must have over every sort of physical research. Priestly possessed precisely those qualifications which are most available for striking out new and brilliant discoveries of facts; a boundless fertility of invention; a power of rapidly seizing remote analogies; and an equal readiness in framing and in abandoning hypotheses, which have no value but as guides to experiment. Lavoisier, less eminent in these respects, possessed in a more peculiar degree the mental characteristics which enable their owner to advance to grand generalizations and scientific principles upon the sure basis of facts. He possessed, in its fullest sense, the true spirit of inductive caution, and even geometrical rigor; and his observations, eminently precise and luminous, always pointed to more general views.

Lavoisier turned his attention to the defects of the existing theory about 1770. He pursued his researches with unwearied industry; and, by a long series of experiments of the most laborious and precise nature, he succeeded in determining that, in all cases of combustion, the one substance which is the real combustible receives an addition, or enters into a new combination; and the matter with which it combines is in all cases that same substance which had been shown by Priestley to be one of the constituents of the atmosphere, then known by the name of vital air.

In 1774 he published his *Opuscules Chimiques et Physiques*, in which, after a full and truly philosophical examination of the labors of preceding experimenters in the discovery of the gases and their characteristic properties, he proceeded to describe his own fundamentally important researches into the true theory of combustion, which may be termed the very sun and center of the whole modern system of chemistry.

It was, however, long before Lavoisier gained a single convert. At length Berthollet, at a meeting of the French academy of sciences in 1785, publicly renounced the old opinions and declared himself a convert. Fourcroy followed his example. In 1787 Morveau acquiesced, and all the younger chemists speedily embraced the new views, and their establishment was thus complete.

These discoveries introduced Lavoisier to the notice of the most eminent persons in France; and in 1776 Turgot, then minister of finance, engaged him to superintend the manufacture of gunpowder for the government. He introduced many valuable improvements in the process of manufacture, and many judicious reforms into the administration of the establishment, and a couple of years later was appointed one of the trustees of the bank of discount of France.

In 1778 Lavoisier, having been incessantly engaged on the subject of gases and combustion, announced the great discovery, "that the respirable portion of the atmosphere is the constituent principle of acids," which he therefore denominated oxygen.

The question as to "the acidifying principle" in chemistry had long formed the subject of discussion. The prevalent theory was that of Becher with various modifications, which made the acid principle a compound of earth and water regarded as elements. Lavoisier found in the instance of a great number of acids that they consisted of a combustible principle united with oxygen, and upon these results he advanced the general theory that all compounds have a binary constitution. He showed this both analytically and synthetically, and hence proceeded to the conclusion that oxygen is the acidifying principle in all acids.

Berthollet opposed this doctrine, and contended that, in general, acidity depended on the manner and proportion in which the constituents are combined. The fact is, in this instance, Lavoisier had advanced a little too rapidly to his conclusion. Had he contented himself with stating that this principle applied to a great number of acids, it would have been strictly true; but he had certainly no proof of its being universally the case. Sir Humphry Davy, some years after, showed, in the course of his important alkaline discoveries, that one of the most powerful acids — the muriatic — does not contain a single particle of oxygen; and when the researches of Gay-Lussac and others had exhibited other proofs of the same thing, it became evident that Lavoisier's assertion required considerable modification. Though nearly all acids have been since included under the general law of containing some supporter of combustion, modern chemistry now classifies them as mono-basic, di-basic, tri-basic, etc., according to the maximum number of their hydrogen atoms replaceable by metals; but a perfect theory of acidity is, perhaps, yet wanting. Lavoisier's discovery, however, was one of first rate magnitude and importance, and with this qualification certainly forms the basis of all our present knowledge of the subject.

Another important research in which Lavoisier engaged, in conjunction with Laplace, was the determination of the specific heats of bodies by means of an ingenious apparatus, which they denominated the calorimeter. These were by far the most precise experiments on the subject which had as yet been made, though some inaccuracies in the method have since been pointed out.

Lavoisier owed much, it must be owned, to those external advantages of fortune, the absence of which, though it cannot confine the flights of real genius, yet may seriously impair the value and efficiency of its exertions; and the presence of which, though it cannot confer the powers of intellect, may yet afford most invaluable aids to the prosecution of research, and the dissemination of knowledge. In the instance before us these advantages were enjoyed to the full extent, and turned to the best use. Lavoisier was enabled to command the most unlimited resources of instrumental aid; he pursued his researches in a laboratory furnished with the most costly apparatus, and was able to put every suggestion to the test of experiment by the assistance of the most skillful artists, and instruments of the most perfect construction.

But as he could thus command these essential advantages for the prosecution of his own investigations, he was equally mindful of the extension of similar advantages to others. He always evinced himself ready to assist the inquiries of those who had not the same means at their disposal, and was no less liberal in aiding them by his stores of information and able advice. Indeed, no one could be more sensible of the mutual advantage to be derived from such intercourse between those engaged in the same scientific labors; and this conviction, joined with a full perception of the immense benefits accruing from personal acquaintance among men of kindred pursuits, and the interchange of social good offices, led him to the regular practice of opening his house on two evenings in every week, for an assembly of all the scientific men of the French capital. His house very soon became a point of general resort and reunion to the philosophers of Europe.

At these meetings general discourse and philosophic discussion were agreeably intermingled; the opinions of the most eminent philosophers were freely canvassed; the most striking and novel passages in the publications of foreign countries were made known, recited, and commented upon; and the progress of experiment was assisted by candid criticism and comparison with theory. In these assemblies might be found, mingling in instructive and delightful conversation, all those whose names made the eighteenth century memorable in the annals of science. Priestley, Fontana, Landriani, Watt, Bolton, and Ingenhouz were associated with Laplace, Lagrange, Borda, Cousin, Monge, Morveau, and Berthollet.

There was also an incalculable advantage in bringing into communication and intimacy men engaged in distinct branches of science. The intercourse of the mathematician with the geologist, of the astronomer with the chemist, of the computer with the experimenter, and of the artist with the theorist could not fail to be of mutual advantage. In no instance were the beneficial effects of such intercourse more strikingly displayed than in the chemical sciences, which, from this sort of comparison of ideas and methods, began now to assume a character of exactness from an infusion of the spirit of geometry. The science, in short, which had hitherto been abandoned to the wildest speculations, and encumbered with the most vague and undefined phraseology — derived from the jargon of the alchemists — began to assume something like arrangement and method in its ideas, and precision and order in its nomenclature. The direct result was Lavoisier's "Method of Chemical Nomenclature" in 1787.

Lavoisier individually profited greatly by the sources of improvement and information thus opened. Whenever any new result presented itself to him, which perhaps, from contradicting all received theories, seemed paradoxical, or at variance with all principles hitherto recognized, it was fully laid before these select assemblies of philosophers. The experiment was exhibited in their presence, and they were invited with the utmost candor to offer their criticisms and objections. In perfect reliance on the mutual spirit of candor, they were not backward in urging whatever difficulties occurred to them, and the truth thus elicited acquired a firmness and stability in its public reception proportioned to the severity of the test it had undergone. Lavoisier seldom announced any discovery until it had passed this ordeal.

At length he combined his philosophical views into a connected system, which he published in 1789, under the title of *Traité Élémentaire de Chimie.* This was a beautiful model of scientific composition, clear and logical in its arrangement, perspicuous and even elegant in its style and manner. These perfections are rarely to be found in elementary works written by original discoverers. The genius which qualifies a man for enlarging the boundaries of science by his own inventions and researches is of a very different class from that which confers the ability to elucidate, in a simple and systematic course, the order and connection of elementary truths. But in Lavoisier these different species of talent were most happily blended. He not only added profound truths to science, but succeeded in adapting them to the apprehension of students, and was able to render them attractive by his eloquence.

In 1791 he entered upon extensive researches, having for their object the application of pneumatic chemistry to the advancement of medicine, in reference to the process of respiration. With this view he examined in great detail the changes which the air undergoes, and the products generated in that process of the animal economy. He had previously, however, as far back as 1780, in the memoirs of the French academy, detailed a series of experiments to determine the quantity of oxygen consumed and carbonic acid generated by respiration, in a given time.

In the twenty volumes of the academy of sciences, from 1772 to 1793, are not less than forty memoirs by Lavoisier, replete with all the grand phenomena of the science: the doctrine of combustion in all its bearings; the nature and analysis of atmospheric air; the generation and combinations of elastic fluids; the properties of heat; the composition of acids; the decomposition and recomposition of water; the solutions of metals; and the phenomena of vegetation, fermentation, and animalization. These are some of the most important subjects of his papers; and during the whole of this period he advanced steadily in the course which was pointed out to him by the unerring rules of inductive inquiry, to which his original genius supplied the commentary.

So well did he secure every point of the results to which he ascended that he never made a false step. It was only in one subject, before alluded to, that he may be said to have gone a few steps too far. Nor did he ever suffer himself to be discouraged, or his ardor to be lessened by the difficulties and obstacles which perpetually impeded his progress. He traced new paths for investigation, and founded a new school of science; and his successors had ample employment in following out the inquiries which he had indicated, and exploring those recesses to which he had opened the way. Upon the basis thus established by Lavoisier, Davy and Berzelius, Liebig and Dumas, and others more recently have built the structure of modern chemistry.

In the relations of social and civil life Lavoisier was exemplary; and he rendered essential service to the state in several capacities. He was treasurer to the academy, and introduced economy and order into its finances. He was also a member of the board of consultation, and took an active share in its business. As a member of the commission of weights and measures, in 1790, he took an active part in the preparation of the metric system; and, when it was proposed to determine a degree of the meridian, he made accurate experiments on the dilation of metals, in conjunction with Laplace in 1782, to ascertain the corrections due to change of temperature in the substances used as measuring rods in those delicate operations.

By the national convention he was consulted on the means of improving the manufacture of assignats, and of increasing the difficulty of forgery. He also turned his attention to matters of rural economy, and, by improved methods of agriculture, on scientific principles, he increased the productiveness of an experimental farm nearly one-half. In 1791 he was invited by the constituent assembly to digest a plan for simplifying the collection of taxes, and produced an excellent treatise on this subject under the title of "The Territorial Riches of France." He was likewise appointed a commissioner of the national treasury, in which he effected some beneficial reforms.

Lavoisier had continuously held one of the posts of farmer-general of revenue for more than twenty years. Many of the farmers-general were men of eminent social position and wealth, and during the reign of terror in France, under the tyranny of Robespierre, Lavoisier foresaw that he would be stripped of all his property. He accordingly prepared to enter the profession of an apothecary so that he might be able to gain a livelihood. But in 1794 Dupin preferred charges of the most flimsy and absurd nature before the revolutionary tribunal against the entire number of farmers-general — twenty-seven in all — and they were condemned to the guillotine. On being seized, Lavoisier entreated at least to be allowed time to finish some experiments in which he was engaged, to complete his final work on chemical philosophy — *Mémoires de Chimie*; but Coffinhall, the president of the tribunal who condemned him, with characteristic brutality, replied: "The republic does not want *savants* or chemists, and the course of justice cannot be suspended." He was accordingly executed May 8, 1794.

Lavoisier in person was tall and graceful, and of lively manners and appearance. He was mild, sociable, and obliging; and in his habits unaffectedly plain and simple. He was liberal in pecuniary assistance to those in need of it; and his hatred of all ostentation in doing good probably concealed greatly the real amount of his beneficence. He married, in 1771, Marie-Anne-Pierrette Paulze, a lady of great talents and accomplishments, who after his death became the wife of Count Rumford.

CUVIER

A. D.		AGE
1769	Born at Montbéliard, France,	..
1784	Entered Karlschule, Stuttgart, Württemberg,	15
1788–94	Private tutor in family of Count d'Héricy, in Normandy,	19–25
1795	Assisted superintendent of botanical gardens, Paris,	26
1796	Member of the French national institute,	27
1798	*Tableau Élémentaire de l'Histoire Naturelle des Animaux*,	29
1800	Professor in the Collège de France; secretary of the French institute,	31
1803	Married,	34
1812	*Recherches sur les Ossements Fossiles*,	43
1814	Councilor of state,	45
1815	Chancellor of university of Paris,	46
1817	*Le Règne Animal*,	48
1818	Member of the French academy,	49
1819	President of the committee of the interior; created baron,	50
1822	Grand master of the faculties of Protestant theology,	53
1826	Grand officer of the legion of honor,	57
1831	Created a peer by Louis Philippe,	62
1832	Died at Paris,	63

GEORGES CHRÉTIEN LÉOPOLD FRÉDÉRIC DAGOBERT CUVIER, the greatest naturalist of his age, and founder of comparative anatomy, was born August 23, 1769, at what is now Montbéliard, France, but at the time of his birth was known as

Mömpelgard, Württemberg. His parents were French Huguenots, who fled from France on account of the persecutions, and throughout life Cuvier was distinguished for his attachment to the Protestant cause. His father was an officer in a Swiss regiment, who married late in life, and his mother being young and accomplished, much of the early education of their son devolved on her.

In 1784 the youth was admitted to Karlschule in Stuttgart, Württemberg, an institution primarily designed for the education of young men desiring to enter the public service. Here he was distinguished for his great memory, and the avidity with which he studied Greek, Latin, and French. He also acquired marked skill in drawing, and cultivated with unusual zeal the various branches of natural history. He is said, however, to have most distinguished himself in the department devoted to the study of the principles and science of government. While in the academy he obtained prizes in every department of study, and at the end of his course was one out of five or six who were presented with a medal for their general proficiency. In this academy he was the fellow student of Schiller, the great German dramatist, and of Sömmering, the anatomist. Although thus early distinguished, he did not remain at Stuttgart long enough to enter upon any public employment, and perhaps to this circumstance we may trace his illustrious career as a naturalist.

At the age of nineteen he accepted the post of tutor to the only son of Count d'Héricy, in Normandy. The residence of the count was near the sea, a situation well adapted to foster Cuvier's love for the study of natural objects which he had acquired under the guidance of Professor Abel, at Stuttgart. The turmoil of the great French revolution, which soon stirred France to its very depths, did not reach him in his quiet residence, and he was enabled to lay the foundations of his exhaustive knowledge of natural history in seclusion and peace. But here an event occurred which quickly brought him to the sphere of his future activity.

The abbé Tessier, widely known for his articles on agriculture in the *Encyclopédie Méthodique*, was obliged to flee from Paris, and, under the guise of a surgeon, sought refuge in Valmont, a small town near the residence of the count. One of the outgrowths of Tessier's activity in this retreat was a society formed for the promotion of agriculture, and at one of its early meetings young Cuvier detected, in the surgeon of Valmont, the writer of the articles in the *Encyclopédie*. This incident led to a friendship between the two, which was eventually attended by important results for Cuvier.

Under this new stimulation in Normandy, Cuvier worked with so much diligence at the anatomy and forms of the lower animals that after Tessier's introduction he became a constant correspondent of Lacépède, Olivier, Geoffroy, and other eminent men in Paris. Of such far reaching results were his researches at this period that they enabled him to recognize the whole of the invertebrate division of animals, which had been included by Linnæus in his class *vermes*. Here he also diligently dissected the mollusca, which subsequently enabled him to follow with so much success the classification of the mollusca, pointed out by Adanson, and founded rather upon the structure of the animal than of its shell.

In 1795, through the exertions of Tessier, Cuvier was invited to Paris as a member of the new commission of arts. He was also appointed assistant to Mertrud in the superintendence of the Jardin des Plantes, or botanical gardens, and professor of natural history to the central school of the museum. In these positions he began that career through which he acquired the reputation of being the greatest teacher of his day, and the museum of the Jardin des Plantes became the most famous collection of comparative anatomy in Europe.

He now began to publish various papers, more especially on the structure of the lower animals, and, in 1798, produced his work entitled *Tableau Élémentaire de l'Histoire Naturelle des Animaux*, or "Elementary View of the Natural History of Animals," in which he began his epoch-making classification of animals. In the same year he published his researches on fossil bones, by the publication of a paper on the "Bones Found in the Gypsum Quarries of Montmartre." In his earlier papers he had devoted considerable attention to the comparison of fossil and recent species of animals, and in the bones of Montmartre he found a rich depository for the exercise of his skill in comparing recent with extinct species. He early seized the idea that each group of animals was formed on a homogenous plan, and that the whole structure of each species was adapted to its living requirements. He was thus enabled by small fragments of bone to reconstruct the whole fabric of an animal, and to give a living picture of the creatures that inhabited the earth in past times. It was by these researches that he was enabled subsequently to give to the world his great work, "Researches on Fossil Bones," in which numerous forms of animal life were presented which had long since been destroyed.

In 1796 the national institute of France was formed, and Cuvier was made a member. In 1800 he became secretary. On the death of the naturalist, Daubenton, Cuvier, in 1800, was named his successor in the chair of the philosophy of natural history in the Collège de France. He still, however, held his position of professor in the Jardin des Plantes. His lectures had been so successful there that they were published by his pupils, MM. Dumeril and Duvernoy, in five volumes. The first appeared in 1800, and the fifth in 1805. They were subsequently republished in 1839, in ten volumes, and contain a vast mass of interesting matter on the subject of zoölogy and comparative anatomy, and are written as they were delivered, in an eloquent and attractive style. Cuvier lectured from copious notes, and was remarkable for his accurate and fluent style, and the interest which he threw into the subject of discourses.

But a new sphere of activity awaited him. Napoleon's great successes had placed him at the head of French affairs, and after the confusion of the revolution he began the legislative reconstruction of France. The first consul was not long in detecting the administrative ability of the eloquent teacher of natural history; and, in 1802, Cuvier was appointed one of six inspectors, to establish lyceums or public schools in the principal towns of France. He established those of Marseilles, Nice, and Bordeaux. During his absence on this duty, in 1803, the French institute was remodeled, and Cuvier was made perpetual secretary of the section of natural sciences, with a salary of six thousand francs a year.

Nothing gave a greater brilliancy to the conquests of Napoleon and the position he had thereby attained than his appreciation of the importance of scientific pursuits. With a much sounder estimate of the value of natural science as a branch of education than was exhibited by the other governments of Europe, he everywhere introduced into his new colleges the study of the natural history sciences, and in Cuvier he found a man profoundly convinced of the importance of these studies to the advancement of mankind. Discoverer as he was, he did not pursue science for his own self-elevation, but was supported in his labors by the thought that he was contributing to the working out of the great designs of providence, and the welfare of the human race.

One of the most brilliant productions of his pen was a report called for by Napoleon on the history of the progress of science since the year 1789. This luminous composition was presented to Napoleon in the council of state. In this remarkable treatise, which was published in Paris in five volumes in 1829, he endeavored to show the connection between the advancement of knowledge and human happiness. He maintained that the object of science was "to lead the mind of man toward its noble destination — a knowledge of truth; to spread sound and healthy ideas among the working classes of the community; to draw human beings from the empire of prejudice and passion; to make reason the arbitrator and supreme guide of public opinion." From this passage it will be seen that Cuvier's pursuit of science was founded on no mere self-glorification, but that his heart was as large as his mind was great, and that he considered the highest destination of the achievements of his genius to be the advancement of his race.

In 1809, 1810, and 1811 we find Cuvier still employed by the imperial government in reorganizing the educational institutions of the continent of Europe. The sword of the conqueror everywhere made way for the minister of education. In 1810 he organized the universities of Piedmont, Genoa, and Tuscany. In 1811 he was in Holland and the Hanseatic towns. His labors extended not alone to the higher classes in the universities, but to schools for the mass of the people. He held that instruction led to civilization, and civilization to morality; that unless the education of the working classes was sound and extensive, they could not appreciate the value of knowledge in those who governed them and exercised professions, and who had received their special education in the universities. Those only who are intimately acquainted with the continent of Europe, at this time, can fully appreciate the intelligent labors of this great man in behalf of its intellectual upbuilding.

Successful as he had been in the other parts of Europe, he had a more delicate mission to perform when sent by the emperor to Rome to organize the university there. But such was his good sense and benignity of manner that, though a Protestant, he found no difficulty in acquitting himself of his diplomatic task, in a manner that gained for him the esteem and approbation of the Roman Catholic world, as well as of his sovereign. On his return Napoleon appointed him master of requests in the council of state, and in 1814, just before his abdication, he named him councilor of state, an appointment which was subsequently confirmed by Louis XVIII. The following year he was appointed chancellor of the university of Paris by the same monarch, and held that post until his death. In 1818 he was elected a member of the French academy, and in 1819 was appointed president of the committee of the interior in the council of state. In the same year Louis XVIII. created him a baron.

The last ten years of Cuvier's life were equally crowded with honors. In 1822 he became grand master of the faculties of Protestant theology in the university of Paris; and under his mastership fifty new Protestant cures were established in France. Numerous professorships of natural history in the minor schools of France were established under his direction; and he became also, at this period, a vice-president of the French Bible society. In 1826 Charles X. bestowed upon him the decoration of grand officer of the legion of honor, and his former sovereign, the king of Württemberg, made him a commander of the order of the crown. In 1830 he began a new course of lectures in the Collège de France on the progress of science in all ages. He opened the third part of his course with an introductory lecture on May 8, 1832. After an unusually eloquent survey, describing the objects of the course, he concluded: "These will be the objects of our future investigations, if time, health, and strength shall be given me to continue and finish them with you." But the health failed, the strength departed, and the time was shortened; for the next day he suffered a paralytic stroke, and expired on May 13, at the age of sixty-three years. In Cuvier's last year Louis Philippe had created him a peer of France, and contemplated making him his minister of the interior.

Cuvier married the widow of M. Duvaucel, a former farmer-general of France, in 1803, and subsequently lived at the Jardin des Plantes, in Paris, for nearly forty years. Here, surrounded with the objects which engrossed so great a portion of his thoughts, he received every Saturday the men of science of Paris, and all others who visited that capital from any part of the world. Professors and pupils met in his rooms to listen to his informal talks, for he was accessible to all. Although compelled to be a very rigid economist of time, his disposition was such that if any one who had business to transact called at an unexpected hour, he was never sent away unheard. "One who lived so far off," Cuvier was wont to say, "had no right to deny himself."

Everything in his house was so arranged as to secure economy of time. His library consisted of several apartments, and each great subject that claimed his attention had a separate room allotted to it. He usually worked, too, it is said, in the apartment belonging to the subject with which he was momentarily engaged, so that he might be surrounded with his materials.

His ordinary custom, when returning from public business in Paris, was to go at once to his study, after passing a few minutes by the way in the room with his family. He came back when dinner was announced, usually with a book in his hand, and returned soon after dinner to his study, where he remained until eleven. He then came to Madame Cuvier's room, and usually had some of the lighter literature of the day read aloud to him. Sometimes the book selected was of a more classic character; and during the last year of his life he had the greater part of Cicero read to him. His manner at all times was courteous, kind, and encouraging. Any one who manifested interest in the subject with which Cuvier was familiar might approach him without fear of meeting with a cold or formal reception.

Cuvier had four children, none of whom survived him. He was a fond husband and father, and few men of his eminence have been more remarkable for the regularity and simplicity of their social life. One of his children, a daughter, lived to be old enough to be betrothed, but died within a few days of her appointed marriage. She was eminent for the beauty and piety of her character; and the affections of the great philosopher were so bound up with this amiable child that it is said her death hastened his own end.

Cuvier's most important works are usually conceded to be those on comparative anatomy, "Researches on Fossil Bones," "Discourse on the Revolutions of the Globe," and "The Animal Kingdom," which was first published in 1817, and revised down to 1830. In the first, to the facts gathered by Claude Perrault and Daubenton, he added innumerable observations of his own, and coördinated these elements into the form of a doctrine. In the second work, he founded a science entirely new, the science of lost species of fossils — in short, palæontology. In the third, he embraced the entire animal creation, and established the classification which serves to-day for the basis of the science of zoölogy — a classification based upon comparative anatomy.

Until this time comparative anatomy was only a collection of facts relative to the structure of animals. Cuvier concluded that anatomy and physiology should form the basis of zoölogy, and that the most general and constant fact in the organization should determine its grand divisions, and the least general and most variable facts the secondary divisions. He thus established a subordination of character, which ought to be, and alone can be, the principle of a natural method; that is to say, of such a method of arrangement of beings that the place occupied by each of them gives a general idea of its organization, and of the relations which connect it with all others — a method which he regarded as science itself reduced to its most simple expression. Thus, examining the modifications of the organs of circulation, respiration, and sensation throughout the animal kingdom, instead of the six classes of Linnæus, Cuvier established four great types, vertebrates, mollusks, articulates, and radiates, which he called embranchments, and divided into classes of nearly equal value with those long established among the vertebrata. This tended very much to raise into importance the inferior animals.

Cuvier's two laws, the law of the subordination of the organs and the law of correlations, with some others, formed part of that science which permitted him methodically to reconstruct a great number of lost species by means of fossil debris. "Such was," says M. Flourens, "the vigor and infallibility of this method that Cuvier could recognize an animal by a single bone, or a single facette of a bone."

As a naturalist, Cuvier takes a permanent rank among the few great men who have effected great revolutions in the sciences which they have cultivated, and who have left ineffaceable traces of the influence of their discoveries. The whole animal kingdom has assumed under his hands a systematic arrangement, founded on a careful and laborious observation of the analogies of internal structure. He converted the science of natural history into a science of strict and severe induction, and conferred on it a dignity hitherto unpossessed by it. He reconstructed, as it were, the fossil remains of an antediluvian world, from imperfect fragments.

STEPHENSON

A. D.		AGE
1781	Born near Wylam, Northumberland, England,	..
1798	"Engineman" at Throckley Bridge,	17
1802	Married,	21
1806	Death of wife,	25
1812	Enginewright at Killingworth,	31
1814	Constructed locomotive steam engine,	33
1815	Patented locomotive; invented safety lamp,	34
1820	Second marriage,	39
1821	Engineer, Stockton and Darlington railway,	40
1826	Engineer, Liverpool and Manchester,	45
1845	Visited Belgium and Spain,	64
1848	Died at Tapton, England,	67

GEORGE STEPHENSON, an illustrious English engineer and chief improver of the steam locomotive, was born of very humble parentage, in a cottage on the Tyne, near Wylam, Northumberland, England, on June 9, 1781. The wages earned by his father, who worked in a colliery, were barely sufficient, even with the most rigid economy, for the sustenance of the household, and consequently none of the children were sent to school.

The early life of Stephenson presents a

record, whose interest cannot be surpassed, of a contest between determined purpose, industry, and sagacity on the one hand, against poverty on the other. He began life by herding cows at twopence a day, but soon exchanged a pastoral for an agricultural sphere, doubling his wages by undertaking to hoe turnips. Then he was taken on at the colliery as a "corfbitter," or "picker," to clear the coal of stones, bats, and dross. His wages were advanced to sixpence a day, and to eightpence when he was allowed to draw the ginhorse. Great was his exultation when, at about fourteen years of age, he was appointed fireman at a shilling a day. From this time his fortunes took him from one pit to another, and procured him rising wages with his rising stature. At Throckley Bridge, when advanced to twelve shillings a week, he joyfully exclaimed, "I am now a made man for life!"

At seventeen he became engineman or plugman. He soon studied and mastered the working of his engine, and it became a sort of pet with him. He learned that the wonderful engines of Watt and Boulton were to be found described in books, and with the object of mastering these books, though a grown man, he went to a night school, at threepence a week, to learn his letters. He then studied the engine books at night by the light of his engine fire. For fourpence a week he included "figuring," while at the pit he acquired the art of braking an engine.

In 1802, when, as a brakesman, he made nearly one pound a week, he married Fanny Henderson, a pretty farm servant, who made him an excellent wife, and brought comfort as her dowry to the cottage which he took for her on Willington Quay. At this time, during his leisure hours, he added to his income by making and mending the shoes of his fellow workmen. Next he took to making shoe lasts, in which he was expert, and acquired a good trade. From cleaning and repairing his own clock, he also became one of the most famous clock doctors in the neighborhood. He was thus prospering and happy until calamity overtook him and he lost his wife, who died in 1806, leaving to his care their only son, who lived to share the fame of his father as an engineer.

Soon after the death of his wife, Stephenson removed for an interval near Montrose, Scotland, where he had charge of an engine in a large spinning mill. On his return he found his father reduced by an accident to blindness, and consequently to poverty, so he paid his father's debts cheerfully, undertook to support him and his mother, and discharged this filial duty toward them until their death. He was again given employment at Killingworth, but his prospects in life about that time were far from hopeful. On one occasion, indeed, so hard had the tide gone against him, that even he had nearly given way to despair. "I wept bitterly," he says in allusion to an intention he had formed of emigrating — "for I knew not where my lot in life might be cast."

In 1812 he was appointed enginewright at Killingworth, with a salary of one hundred pounds a year. Here he began his experiments with the locomotive. Wooden rails, it appears, were first laid down for the service of coalpits at an early period. The invention consisted of a double parallel line of wooden beams or trams fixed to the ground, and furnished with flanges to prevent the wheels of vehicles from slipping aside. Along these flanged beams wagons were drawn by horses with such comparative ease that, instead of a load of seventeen hundredweight by a common road, a load of forty-two hundredweight could now be drawn by a single horse.

These new thoroughfares, called tramways, were made across fields, the proprietors of which received a certain rent for the way-leave or use made of them — which term, way-leave, is still employed in England for arrangements of this kind. To the coal districts of the north of England, therefore, is indisputably due the simple yet meritorious contrivance which, from less to more, led to the modern railway with all its wonderful machinery; nor is it useless to note that the invention, in its early stages, owed nothing to men of education or high scientific attainments, but was mainly the work of obscure mechanics and illiterate enthusiasts.

The date of the invention of tramways is uncertain, but by good authorities it is referred to the early part of the seventeenth century. From the northern coal districts it gradually came into use in other mining districts in England, as also in the south of Scotland. The seventeenth century was not favorable to mechanical improvement. Not until about 1700 was there any marked advance on the original tramway. The first step was the clothing of the wooden beams with long slips of iron, to prevent excessive tear and wear. This also being found defective, a second and more complete improvement, about 1740, was the substitution of cast-iron rails fixed in parallel lines on cross wooden sleepers. This species of railway became pretty general in mining districts between 1745 and 1775. In the former of these years, one was in operation in Scotland — namely, a short coal line from Tranent to Cockenzie, which General Cope selected as a position at the battle of Prestonpans. Though now considerably improved, railways did not attract attention as being suitable for general traffic. The success of canals not only turned the public mind in that direction, but raised up a powerful canal interest, which viewed the progress of railways with extreme jealousy and ill will.

The use of cast-iron rails led to an improved method of traction. Instead of employing a single large wagon, the plan of linking together a series of smaller wagons was adopted — the germ of the modern train. The next improvement consisted in putting flanges on the wheels instead of the rails, by which great facility of transit was afforded. The draught still continued to be executed by horses; but, as the railway system seemed to possess immense capabilities of expansion, many minds labored in devising schemes to substitute steam apparatus.

The invention of the locomotive, like that of railways, was the work of successive geniuses. Watt had shown the practicability of fixed steam engines; what was now wanted was an engine that would travel by its own internal impulse. The merit of inventing a self-acting steam carriage is allowed to be due to Richard Trevithick, a clever but eccentric engineer. In 1802 he took out a patent for a steam carriage, and this novel machine he exhibited to large crowds of admiring spectators on a piece of ground near London. Immediately afterward he adapted his carriage for the drawing of wagons on railways, a duty which it successfully executed on the Merthyr-Tydvil railway in 1804. This was the first locomotive; but it was far from perfect. It drew only ten tons of bar iron at the rate of five miles an hour. Trevithick did not remain in England to improve on his invention, nor did the modern achievements of his machine immediately induce others to make any distinct advance on his ingenious contrivance.

For this lethargy there were various causes; but the principal consisted in a universal belief among engineers that the locomotive could not be expected to gain great speed, to ascend a moderate incline, or to draw a heavy load, unless the wheels were provided with a cogged rim to work on a corresponding rack along the rails. Numerous schemes were made the subject of patents to overcome this imaginary difficulty — a circumstance which gives one a poor opinion of the state of engineering knowledge at the beginning of the nineteenth century. That locomotives running with smooth wheels on smooth rails, by mere weight and friction, as exemplified by Trevithick, could draw heavy loads up a moderate incline was at length, in 1811, established as a fact by Blackett, a coal proprietor, on the Wylam railway, which Stephenson had often observed and studied. The means for imparting speed alone remained to be given.

From an early period Stephenson was quite sanguine as to the "traveling engine." He had inspected "Black Billy" and Blenkinsop's Leeds engine, and at length he brought the subject before Lord Ravensworth, the principal proprietor of the Killingworth colliery. His lordship advanced money, and an engine was made which was accordingly called "My Lord," and placed on Killingworth railway, July 25, 1814. It was the most successful working engine that had yet been constructed, and succeeded in drawing thirty tons weight at four miles an hour. Still its economy was questionable, for it proved only that steam power and horse power were on a par in point of cost, while the speed of the engine was not beyond that of a horse's walk.

At this point, however, Stephenson's genius turned the decision of the issue. The happy thought came to him to utilize the escaping steam by making it blow his fire. This invention of the steam blast in the smokestack imparted velocity to the smoke, and so increased the ascending current of air that the power of the engine became more than doubled. He determined to make another engine with an entire change in the construction and mechanical arrangements of the machine. For this work Dodds provided the necessary funds, and, in 1815, Stephenson and Dodds conjointly took out a patent for this improved engine, which combined, in a remarkable degree, the essential requisites of an economical locomotive. Although many improvements in detail were afterward introduced by George Stephenson himself, as well as by his equally distinguished son, Robert, it is perhaps not too much to say that this engine, as a mechanical contrivance, contained the germ of all that has since been effected. It may, in fact, be regarded as the type of the present locomotive engine.

In 1815 the invention of a colliery safety lamp, the "Geordie," also brought Stephenson's name before the public. The fact of his invention being almost simultaneous with that of Sir Humphry Davy gave rise to a long controversy between their respective friends and supporters. In 1820 Stephenson married his second wife, Elizabeth Hindmarsh, the daughter of a farmer at Black Callerton.

Stephenson was now regarded as an enthusiast, and men shook their heads at his engine, predicting a "terrible blow up some day." He himself went so far as to say that it would supersede every other tractive power. At this period he began to direct his particular attention to the state of the roadbed, as he perceived that the extended use of the locomotive must necessarily depend in a great measure upon the perfect solidity, continuity, and smoothness of the way along which the engine traveled. Even then he was in the habit of regarding the road and the locomotive as one machine, speaking of the rail and the wheel as "man and wife."

Stephenson had no means of bringing his important invention prominently under the notice of the public. At length it attracted the attention of William James and Edward Pease. The former saw Stephenson's locomotive at Killingworth in 1821, and declared that it would effect a revolution in society. He expressed his belief that Stephenson was the greatest practical genius of the age, and truly predicted that his fame in the world would rank equal to that of Watt.

When the Stockton and Darlington railway was sanctioned by parliament in 1821, Stephenson was appointed constructing engineer for the company, at three hundred pounds per annum. The line was opened in 1825, proved a success financially, and was in great part supplied with Stephenson's engines. When the railway between Liverpool and Manchester was projected, following the rapid growth of the trade of South Lancashire, together with the unpopular management of the Bridgewater canal, Stephenson was also chosen engineer, with a salary of one thousand pounds a year. That he proposed to work the line with an engine which was to go at the rate of twelve miles an hour was a fact held up as of itself sufficient to stamp the project as a bubble. "Twelve miles an hour!" exclaimed the *Quarterly Review* — "as well trust one's self to be fired off on a Congreve rocket."

Accordingly, Stephenson was called before a parliamentary committee and was obliged to undergo an examination into the project which lasted three days. One of the members asked whether, if a cow should stray on the line and get in front of the engine, that would not be a very awkward circumstance. "Yes," replied the witness, "very awkward indeed — *for the coo!*" At length, after many difficulties had been settled, authorization was obtained, and the line was completed in 1829.

There then ensued the memorable competition of engines, resulting in the complete triumph of Stephenson's "Rocket," which, to the astonishment of every one except himself, was found capable of traveling at the until then undreamt-of rate of thirty-five miles an hour. "Now," exclaimed one of the directors, "George Stephenson has at last delivered himself." The problem of the locomotive engine was thus practically solved. The railway was opened in 1830, and the prosperity of the company proved the success of the new mode of traveling.

The subsequent career of Stephenson was as rapid and smooth as the railway locomotion he had done so much to realize. He took the lead at once in railway engineering, became an extensive locomotive manufacturer at Newcastle, and a railway contractor, a great colliery and iron-work owner, particularly at Claycross, and acquired great wealth. While occupied in carrying out the vast system of railway which soon overspread the country, Stephenson's home was at Alton Grange, near Leicester. He saw but little of it, however, as he was often traveling on business for weeks at a time.

During the three years ending 1837, he was principal engineer on the North Midland, York and North Midland, Manchester and Leeds, Birmingham and Derby, and Sheffield and Rotherham railways. In 1836 alone, two hundred and fourteen miles of railway were put under his direction, involving a capital of five million pounds. His offices in London were crowded every day with men of every rank and condition, eager to strengthen their prospectuses by the weight of his name.

Where he disapproved — and at this time he almost always did disapprove — he invariably declined, though by acceding he might have made enormous gain; but to make money without labor or honor had no charm for Stephenson.

In the autumn of 1845 he visited Belgium and Spain for professional purposes. At Brussels he was honored with a magnificent banquet, at which the most eminent scientific men of Belgium were present. A handsome marble pedestal, surmounted with the bust of the "father of railways," occupied one end of the city hall on that occasion and his reception was of the most enthusiastic description.

He paid a second visit to Belgium in the same year, and shortly afterward proceeded to Spain for the purpose of examining and reporting upon a plan for constructing the Royal North Spanish railway, a concession for the construction of which had shortly before been made to Sir Joshua Walmsley. He made an adverse report on the entire project, and on his way home he was seized with pleurisy, from which attack he does not seem ever to have thoroughly recovered.

He occupied his declining years with the quiet pursuits of a country gentleman, at Tapton, near Chesterfield, where he indulged the love of nature, which, through all his busy life, had never left him. Even in the midst of his immense business, his heart remained as youthful as ever. In spring he would snatch a day for bird-nesting or gardening; in autumn, nutting was still a favorite recreation. We find him at this time writing a touching account to his son of a pair of robins. Strong as he had shown himself when the world was all against him, he was not less so in the midst of his success. His life at Tapton during his later years was occasionally diversified with a visit to London, Newcastle, and other places, and by a limited indulgence in social and scientific diversions. He was created a knight of Leopold of Belgium; a fellow of the royal society; and he was the founder and first president of the society of civil engineers. Both he and his son after him were offered knighthood at the hand of the English sovereign, but both declined.

As late as July 26, 1848, Stephenson attended a meeting of the institute of mechanical engineers at Birmingham, and read a paper on the "Fallacies of the Rotary Engine." It was his last appearance of a public nature. Shortly after his return to Tapton he had an attack of intermittent fever, and a sudden effusion of blood from the lungs carried him to his death on August 12, 1848, in his sixty-eighth year. He was buried in Trinity church, Chesterfield, where a simple tablet marks the great engineer's last resting place. Statues have been erected to his memory and the honor of his achievements in St. George's hall, Liverpool, and Newcastle-on-the-Tyne.

Stephenson was a man of compact frame, well-knit, and rather spare. His hair became gray at an early age, and toward the close of his life it was of a pure silky whiteness. His face indicated a shrewd, kind, honest, manly nature. His complexion was fair and ruddy; forehead large and high, projecting over the eyes; and there was that massive breadth across the lower part which is usually observed in men of eminent constructive skill. The mouth was firmly marked, and there were both shrewdness and humor in his keen gray eyes.

The leading feature of his mind was honesty of purpose, and determination in carrying it out. "I have fought for the locomotive single-handed for nearly twenty years," he says; "I put up with every rebuff, determined not to be put down." Toward trickery and affectation he never concealed his contempt, while honest merit never appealed to his liberality in vain. He had none of the indoor habits of a student. He read very little. Books wearied him, and sent him to sleep. He wrote very few letters, and avoided them whenever he could. His greatest pleasure was in conversation; hence he was always glad of the society of intelligent, cultivated persons, though the conventional functions of society had little charm for him.

It was only after repeated invitations from Sir Robert Peel, the celebrated English statesman, that Stephenson consented to visit the former at his house at Drayton. It was without the least hesitation, however, that he accepted an invitation to meet Emerson during his visit to England in 1848. Emerson subsequently said that "it was worth crossing the Atlantic to have seen Stephenson alone; he had such native force of character and vigor of intellect."

In manner he was simple, modest, frank, and unassuming. When he rose to a place of eminence and influence, he took his place among men of the highest social position with perfect self-possession. On one occasion, it is

From a photograph

said, he incidentally met a gentleman and his wife at an inn in Derbyshire, whom he entertained for some time with his shrewd observations and playful sallies. At length the lady, somewhat testily, requested to know the name of the remarkable stranger.

"Why, madam," said he, "they used once to call me Georgie Stephenson; I'm now called George Stephenson, Esquire, of Tapton House, near Chesterfield. And further let me say, that I've dined with princes, and peers, and commoners — with persons of all classes, from the highest to the humblest; I've made my dinner off a red herring in a hedge bottom, and gone through the meanest drudgery; I've seen mankind in all its phases, and the conclusion I have arrived at is — that if we're all stripped, there's not much difference."

Though a thrifty and frugal man, he was far from sordid. His hand was open to his former fellow workmen whom old age had left in poverty; and he performed many generous acts in a noble and modest manner. Neither would he permit an attack to be made upon the absent or the weak. The whole secret of his success in life, he persisted in saying, was his careful improvement of time "which is the rock out of which fortunes are carved and great characters formed." He believed in genius to the extent that Buffon did when he said that "patience is genius"; or as some other thinker put it, when he defined genius to be the power of making efforts. But he would never have it he was a genius, or that he had done anything which other men, equally laborious and persevering as himself, could not have accomplished. He was a late learner; but he went on learning to the end.

"As respects the immense advantages of railways to mankind," says Smiles, "there cannot be two opinions. They exhibit, probably, the grandest organization of capital and labor that the world has yet seen. As tending to multiply and spread abroad the conveniences of life, opening up new fields of industry, bringing nations nearer to each other, and thus promoting the great ends of civilization, the founding of the railway system by George Stephenson must be regarded as one of the most important events, if not the *very* greatest, in the first half of the nineteenth century."

SAMUEL FINLEY BREESE MORSE, artist and inventor, and foremost designer of the electric telegraph, was born at Charlestown, Massachusetts, April 27, 1791. He was the son of Rev. Jedediah Morse, D. D., well known in New England history as a very active religious worker and geographer, and Elizabeth Ann Breese. To the Morse family eleven children were born, only three of whom — Samuel and two brothers — survived childhood.

Samuel, at the age of seven, was sent to the school of Professor Foster at Andover, Mass., and passed from there to Phillips academy, where he was prepared for college. At fourteen he was admitted to Yale college, his father's *alma mater*. His first knowledge of electricity and natural philosophy he gained under Professor Jeremiah Day and Benjamin Silliman, and his letters home gave abundant evidence of his interest in his studies. While at college, too, his artistic talent was plainly manifest, and, although wholly untaught, he produced a number of miniature portraits of his fellow students.

Morse was graduated from Yale in July, 1810. Immediately he decided to become a painter, and arrangements were made for him to accompany Washington Allston, at that time one of the most promising of American painters, to England in the following year. His first letter home contained an ardent wish for that which years afterward his great invention made possible. His words were: "*I wish that in an instant I could communicate the information*, but three thousand miles are not passed over in an instant, and we must wait four long weeks before we can hear from each other."

Allston introduced Morse to Benjamin West, the famous American painter then settled in London, and president of the royal academy. West accepted him as a student, and showed him many favors because he was an American. Allston continued, also, to act the part of friend and critic. The young student remained in England four years, within which time the war of 1812 took place. The hostilities, however, created no enmity against him, and, in 1813, he won the gold medal of the society of arts for a figure representing the "Death of Hercules." A large painting which he subsequently made from the same subject was admitted to the exhibition of the royal academy. It was highly praised, and one of the British newspapers ranked it among the nine best paintings in a gallery of nearly a thousand.

Morse returned home in the summer of 1815, and first opened a studio in Boston, where he exhibited a large painting, "The Judgment of Jupiter," and waited for orders for historical pictures. After a year had passed with very indifferent success, he started out as a traveling portrait painter and achieved much better results. Within that year of waiting, however, his genius for invention began to assert itself. In conjunction with his brother, Sidney, he invented a modification of the common suction pump, adapted to the use of fire engines, and secured a patent for it.

In his travels as a portrait painter he met Miss Lucretia P. Walker, daughter of Charles Walker, of Concord, New Hampshire, and married her October 1, 1818. The winter before and that following his marriage he spent at Charlestown, South Carolina, in the pursuit of his profession. In the winter of 1819-20 he painted a portrait of President Monroe for the common council of Charlestown. His father having resigned his charge and removed to New Haven, Morse spent the following summer there with his wife and infant daughter. The next winter he executed a large picture of the house of representatives, in which were eighty portraits of members.

Several years of struggle — in Albany, New York, and other places — followed. During this period his inventive faculty was not idle. He devised a machine for carving in marble copies of any model, and was revolving other ideas in his mind. In February, 1825, he was in Washington painting a full-length portrait of Lafayette for the city of New York, when his father wrote him that his beloved wife had died of heart disease on the 7th of that month. She was only twenty-five years of age, and a woman of great loveliness.

After his wife's death Morse settled in New York and made gradual progress with his brush. He was one of the leading spirits in establishing, during the winter of 1825-26, the national academy of design, the prime object of which was to provide art students with the facilities that were then churlishly denied them by the American academy of arts. He was its first president, and was continued in the office until 1845, when he retired from it to give his attention to his telegraphic researches.

In the early part of 1827 Morse attended a course of lectures on electromagnetism, delivered before the New York Athenæum by Professor James Freeman Dana, with whom he was well acquainted. At these lectures experiments were shown to illustrate the power of a straight wire carrying a current of electricity to induce magnetism, and the increased effect of such a wire bent into a ring, into a series of rings forming a spiral, and into a flat spiral or volute. Professor Dana died soon after giving these lectures. Morse sailed for Italy in 1829 to execute a commission for some pictures, and the subject apparently passed out of his thoughts for a time.

He was absent three years, during which he spent about two-thirds of his time in Rome, and a year in Paris. On the return voyage from Havre to New York, in 1832, in company with William C. Rives, American minister to France, Dr. Charles T. Jackson, of Boston, and others, according to the best testimony on the subject, he first conceived the idea of a magnetic telegraph. The incident which led up to the invention is thus described by Morse's biographer, Dr. S. Irenæus Prime:

"In the early part of the voyage conversation at the dinner table turned upon recent discoveries in electromagnetism, and the experiments of Ampère with the electromagnet. Dr. Jackson spoke of the length of wire in the coil of a magnet, and the question was asked by some one of the company, if the velocity of electricity was retarded by the length of the wire. Dr. Jackson replied that electricity passes instantaneously over any known length of wire. He referred to experiments made by Dr. Franklin, with several miles of wire in circuit, to ascertain the velocity of electricity; the result being that he could observe no difference of time between the touch at one extremity and the spark at the other. At this point Morse interposed the remark, 'If the presence of electricity can be made visible in any part of the circuit, I see no reason why intelligence may not be transmitted instantaneously by electricity.' The conversation went on. But the one new idea had taken complete possession of the mind of Morse. It was as sudden and pervading as if he had received at that moment an electric shock."

The invention was already complete as to its main features — a current of electricity passing through a wire between two places, and signals to be made at one terminus by making and breaking the circuit at various intervals at the other. As soon as opportunity offered, Morse set about sketching in his notebook details of the apparatus and a scheme of dot-and-dash signals for numbers and words. He showed his drawings to his fellow passengers and to the captain of the ship, and told them what he hoped to accomplish. Having arrived in New York, Morse had before him the problem of devising an apparatus to embody his ideas. He could devote but little time or money to the task, for he was dependent on his painting and his pupils for a livelihood. Two or three years passed, during which he experimented as he had opportunity.

In 1835 he was appointed professor of the literature of the arts of design in the university of New York, and a studio was assigned to him on the third floor in the north wing of the original building in Washington square. Here he prosecuted his experiments, and here, in order to economize his scanty means, he slept and took his meals, prepared by himself. In January, 1836, he gave one of his colleagues at the university, Professor Leonard D. Gale, a private view of his first practicable instrument.

He worked on through 1836 and half of 1837, occupied mainly with trying various modifications of the marking apparatus and in devising the relay instrument. In these experiments he was assisted by Professor Gale. Having set up his telegraph so as to operate through about a third of a mile of wire stretched back and forth in the cabinet of the university, he showed it to Alfred Vail, among others, who soon entered into a partnership with Morse and received a one-fourth interest in the patent to be secured, in return for providing means and facilities for developing the invention.

In 1837 Morse filed a caveat at the patent office, and, together with Vail and Professor Gale, who were admitted to the partnership, enthusiastically renewed his exertions. Several valuable modifications of the invention are due to the ingenuity of Vail. He then took an improved instrument to Washington, and exhibited the telegraph on a ten-mile circuit to President Van Buren and his cabinet, members of congress, foreign ministers, and men of science. His petition to congress for an appropriation of thirty thousand dollars to defray the expense of an experimental line of fifty miles was not acted upon when congress adjourned in March. The Hon. F. O. J. Smith of Maine was now admitted to the partnership. He and Morse drew the specifications for the American patent and then both sailed for Europe to procure patents there in 1838.

In England, Morse met with the opposition of both Wheatstone and Cooke, who had recently patented a telegraph requiring six wires and making signals by deflecting five magnetic needles, but producing no record on paper. His application was rejected by the attorney-general of Great Britain, on the ground that an account of it had been published in England, although this account gave none of the essential details. He was further told by that official that "America was a large country, and he ought to be satisfied with a patent there!" Proceeding to Paris, he was cordially received by Humboldt, Arago, Gay-Lussac, and other distinguished *savants*, and readily procured a French patent.

Morse had met M. Daguerre, the inventor of the daguerreotype, in Paris, and each had shown the other his invention. As an artist

Morse became very much interested in the daguerreotype process, and, after it was made public in the summer of 1839, obtained from the inventor instructions which enabled him to introduce it in America. In connection with Professor John W. Draper, he soon applied the process to the taking of portraits — for which its inventor had doubted its being applicable.

The year 1839 was crowded with discouragements. A provisional arrangement to introduce the telegraph into Russia, which Morse had made with an agent of the Russian government while he was in Paris, failed to receive the approval of the czar. Meanwhile the rival schemes of Wheatstone, in England, and Steinheil, in Bavaria, were making progress. The years 1840 and 1841, too, dragged through without any improvement in Morse's prospects. In the spring of 1840 he completed the formalities required which had been interrupted by his departure for Europe in 1838, and received his patent. Wheatstone had actually secured an American patent for some of his devices at an earlier date, and was urging his scheme upon congress. Morse's partners had suffered financial reverses and were no longer able to help him. Almost despairing, he worked on constructing improved instruments with his own hands, and obtaining a precarious livelihood by giving lessons in painting.

The long session of congress in 1841-42 wore away without any attention being secured for the telegraph. When the short session was within a fortnight of its close, in February, 1843, the bill passed the house. There was a great amount of business before the senate, and the telegraph bill had not been reached when the last day of the session opened. All that day and in the evening Morse sat in the gallery of the senate. Then, assured by his friends that there was no longer any hope, he left the capitol well-nigh broken-hearted. The next morning he was met at breakfast with congratulations. A few minutes before midnight the bill had been taken up and passed.

Morse's suggestion that the trial line run between Washington and Baltimore was accepted, and before the month was out preparations for its construction were actively under way. On May 24, 1844, many of the highest officers of the government assembled with the personal friends of Morse, in Washington, to witness the first operation of the telegraph over the completed line. To the daughter of Commissioner Ellsworth, who had been the first to inform him of the passage of the appropriation for the telegraph, Morse had promised that she should give the first message to be sent over the finished line. At the suggestion of her mother she chose the text, "What hath God wrought," which was transmitted by Morse to Vail in Baltimore, and by him instantly returned. The toil and struggles of twelve years were now crowned with success, and the inventor received the richly merited congratulations of the assembled company.

The public test of the telegraph, the organization of the Magnetic telegraph company to construct a line from Washington to New York, and the subsequent development of American lines are familiar history. Many violators of Morse's patents and the assumption of his rights by rival companies followed, and involved him in a long series of lawsuits; but these were eventually decided in his favor, and he reaped the benefits to which his invention entitled him.

Morse sailed from New York early in August, 1845, to present his telegraph again to European nations under much more favorable auspices than before. Accomplishing nothing in England, he visited Hamburg, and afterward Paris, but returned to America in November, having received many honors, but nothing more substantial. Meanwhile numerous lines were in construction at home, and in the next year the telegraph reached from Washington through Philadelphia and New York to Boston, from New York to Buffalo by way of Albany, and there were many branch lines in operation. Morse's system had been adopted by the Austrian government early in the year.

In 1847 Morse bought a tract of two hundred acres on the Hudson river just below Poughkeepsie. He named his place "Locust Grove," and here he built a tasteful mansion, where he gathered his children and grandchildren about him. He had never been able to enjoy a home since he left his father's roof up to this time. The next year he married Miss Sarah E. Griswold, a mute. Her mother was a cousin of his, and her father was an army officer.

While Morse could now enjoy comfort and happiness he was by no means idle. The constant attempts to displace or infringe upon his invention entailed upon him a great amount of labor in correspondence, and in collecting and arranging evidence to combat them. Yet he was able to enjoy considerable compensation for his many years of toil and privation. And his own invention ministered to his pleasure and comfort; for, with a telegraphic instrument on his library table, he would converse with friends and correspondents in every important place in his own land, and in later years could exchange messages with those on the opposite side of the Atlantic. Several years later he bought for a winter residence a beautiful house in New York, No. 5 West Twenty-second street. The building is now marked with a tablet bearing this inscription: "In this house S. F. B. Morse lived for many years and died."

Morse was one of the few great inventors who received an adequate pecuniary reward for their services to the world, and to whom merited honors come while they are alive. He received the degree of doctor of laws from Yale college, and was elected to membership in learned societies of the United States, France, Belgium, Sweden, and Switzerland. Orders and decorations were bestowed upon him between 1848 and 1864 by the sovereigns of Turkey, Prussia, Württemberg, Austria, France, Denmark, Spain, Portugal, and Italy. This list stands in chronological order. It will be observed that the sultan of Turkey took precedence in honoring the inventor of the telegraph over the rulers of many more pretentious nations, while England does not appear at all. We may well believe the statement of his biographer that "Professor Morse received a greater number of honorary distinctions than were ever bestowed upon any other private citizen."

Submarine telegraphy also originated with Morse, who laid the first submarine lines in New York harbor in 1842. He was known to have considered it as early as 1837 and 1838; and in a letter from him to the secretary of the treasury, at Washington, dated August 10, 1843, it is believed occurs the first practical suggestion of the Atlantic telegraph. In 1856 he went to Europe to superintend some of the preparations for laying the Atlantic cable, and in connection with this trip made a tour through France, Germany, Denmark, and Russia. Presentations at royal courts, and honors by men of science and affairs attended his whole progress. Perhaps the greatest triumph was a public dinner given to him in London, where a very cold shoulder had been his portion eighteen years before. W. F. Cooke, who had been the partner of his chief English rival, presided at the dinner.

In 1857, Morse, by the advice of friends holding high official stations, issued a memorial asking for compensation for the use of his telegraph in the various countries of Europe. He had the best claim on France, for he had actually obtained a patent in that country, but the government, which had a monopoly of transmitting intelligence, had declined to use his invention for some years and had afterward adopted it without compensation to him. Negotiations followed which resulted, in 1858, in a sum equal to eighty thousand dollars being awarded to him by a conference of representatives of ten European governments — Austria, Belgium, France, the Netherlands, Piedmont, Russia, Sweden, Tuscany, Turkey, and the holy see. Morse's telegraph had now come into use to the exclusion of its rivals everywhere except to a limited extent in Great Britain.

In 1869, following his last visit to Europe, a movement was started by the operators in Alleghany city, Pennsylvania, to bestow a testimonial upon the inventor of the telegraph in our own country. A sum of money was raised, mostly in one-dollar subscriptions, sufficient to erect the bronze statue of Morse, which now stands in Central park, New York. It was unveiled on June 10, 1871, with inspiring and enthusiastic exercises.

Throughout his long life Morse had suffered little from illness. In his latter years he became subject to neuralgia, which, in the winter of 1871-72, concentrated its attacks in his head. After weeks of intense pain he fell into a stupor from which he partly aroused at times, and finally passed away April 2, 1872. At his funeral and afterward high honors were paid to his memory by the states of New York and Massachusetts, the congress of the United States, the great telegraphic companies, by many cities, by the societies of which he was a member, and by assemblages of individuals.

"In person," says his biographer, Dr. Prime, "Professor Morse was tall, slender, graceful, and attractive. Six feet in stature, he stood erect and firm, even in old age. His blue eyes were expressive of genius and affection. His nature was a rare combination of solid intellect and delicate sensibility. Thoughtful, sober, and quiet, he readily entered into the enjoyments of domestic and social life, indulging in sallies of humor, and readily appreciating and greatly enjoying the wit of others. Dignified in his intercourse with men, courteous and affable with the gentler sex, he was a good husband, a judicious father, a generous and faithful friend. He was as gentle as he was great. Many thought him weak because he was simple, childlike, and unworldly. Often he suffered wrong rather than resist, and this disposition to yield was frequently his loss."

When wealth came to him, Morse was not backward in conferring benefactions upon worthy persons and institutions. He was a man of firm religious convictions, and gave many donations to churches, theological seminaries, and missionary societies. A love for his early art clung to him throughout his life. The honors received for his artistic talent were especially prized by him, and in his later years he encouraged struggling artists of ability by purchasing their pictures, and gave aid to art societies and institutions.

What Morse accomplished for the advance of civilization was due chiefly to an unbounded perseverance which enabled him to endure the grievous hardships and triumph over the enormous obstacles that lay in his path. It has been well said that "the genius and labor of such a man reflect glory upon his country, so that his name becomes part of the national heritage and treasure."

CHARLES ROBERT DARWIN, distinguished English naturalist and biologist, and the chief expositor of the theory of evolution, was born at Shrewsbury, England, February 12, 1809. He was the son of a physician, Dr. Robert Waring Darwin; a grandson of the naturalist and poet, Erasmus Darwin, on his father's side, and of Josiah Wedgwood, the famous English potter, on his mother's side. The laws of heredity would seem to destine him for a scientific career, but his taste for this pursuit was very slow of development.

In the summer of 1818 Charles attended the school at Shrewsbury, of which Dr. Butler — afterward bishop of Litchfield — was head master, and left a very neutral impression as a student. So little zeal did he display both in outdoor and laboratory studies that, contrary to general expectation, no legends of his early days have been handed down to his biographers.

It was his father's wish that he should adopt his own profession, that of medicine, and accordingly he was sent, at the age of sixteen, to the university of Edinburgh. The prospect of living the life of a practitioner did not please his fancy; but while at Edinburgh he began to evince considerable interest in natural history. The records of the Plinian society show that in 1826, and the year following, he read two papers, one on the ova of Flustra, in which he stated that he had discovered organs of motion.

Yielding to his repugnance toward the practice of medicine, Dr. Darwin sent his son to Christ's college, Cambridge, in 1828, with the expectation that divinity would prove more attractive to him and that he would enter the ministry; but again his father was to be disappointed. At the university he met a strong and gentle man who was destined to exercise a controlling influence in forming his mind and moulding his destiny. This was Professor Henslow, who filled the chair of botany. Darwin says that prior to meeting him the only objects of natural history for which he cared were foxes and partridges; but under Henslow's leadership the young man became an ardent collector, especially in entomology, the capture of an insect in the fens furnishing the first occasion on which his name appeared in print. He became so absorbed in the fundamental studies of natural science that he abandoned, if he ever seriously entertained, the intention of seeking ordination to the ministry; and the charm of his intercourse with Professor Henslow seems to have acted profoundly upon him in settling his dominant qualities, mental and social, and in finally shaping his career.

The grateful words which Darwin wrote of his friend and teacher have often been reiterated of Darwin by those who had close personal intimacy with him. He writes of Professor Henslow, "I never once saw his temper even ruffled. He never took an ill-natured view of any one's character, though very far from blind to the foibles of others. It always struck me that his mind could not well be touched by any paltry feeling of envy, vanity, or jealousy. With all this equability of temper and remarkable benevolence, there was no insipidity of character. A man must have been blind not to have perceived that beneath this placid exterior there was a vigorous and determined will. When principle came into play, no power on earth could have turned him a hair's breadth. In intellect, as far as I could judge, accurate powers of observation, sound sense, and cautious judgment seemed to predominate. Nothing seemed to give him so much enjoyment as drawing conclusions from minute observation."

The zeal and proficiency which Darwin displayed in every department of natural science henceforward gradually won him such distinction that, when a naturalist was wanted to accompany Captain Fitzroy on the surveying voyage of the *Beagle*, the opportunity was offered Darwin through the friendship of Professor Henslow. At first his father objected to his availing himself of it, fearing that so thorough a change of life would dissuade him from entering the church, but he at length consented and Darwin, after receiving his B. A., sailed in December, 1831, and did not return until October, 1836. Meanwhile he visited Teneriffe, the Cape Verd islands, Brazil, Montevideo, Tierra del Fuego, Buenos Ayres, Valparaiso, Chili, the Galapagos, Tahiti, New Zealand, Tasmania, and the Keeling islands, in which last he started his famous theory of coral reefs. It was during this long expedition that Darwin obtained that intimate knowledge of the fauna, flora, and geology of many climes which so admirably equipped him for the great task he was to perform.

During the voyage he suffered so severely from seasickness and encountered such prolonged hardship that his health was permanently injured, chronic dyspepsia holding him a life-long victim. In resisting its effects upon his temper it was fortunate that he was able to recall the gentle and amiable example of his university tutor.

In 1839 Darwin married his cousin, Emma Wedgwood, and, subsequently — 1842 — selected a home at Down, in Kent, where he spent his entire life, away from the annoyances and distractions of great cities and surrounded by the physical and moral environments which suited his scientific habits. In the same year he published his *Journal of Researches*, and was elected a fellow of the royal society. The *Journal* was a modest epitome of his observations made during the voyage of the *Beagle*. This voyage, in fact, laid the foundation of Darwin's scientific career, and pointed out its course. Well read in the literature of all branches of science, animated by the "Personal Narrative" of Humboldt, and trained by Henslow to habits of cautious and acute observation of the minutest phenomena in the organic and inorganic world, he was led to seek for himself a key to the mystery which Lamarck had left unsolved when he affirmed that the similarity of organic forms was to be explained by their derivation, and their diversity by their adaptation to the conditions of existence.

His contemplation of what herein is left undefined — namely, the law by which both derivation and diversity may be accounted for — gradually crystallized into a single inquiry, "How did species originate?" and it was as early as the year 1834, when he was twenty-five years old, being "much struck with certain facts in the distribution of the organic beings inhabiting South America, and in the geological relations of the present to the past inhabitants of that continent," he conceived that, "by patiently accumulating and reflecting on all sorts of facts that could possibly have any sort of bearing on the matter, some light might be thrown on the origin of species." He did not, however, at once disclose this object, which became from that time until 1859 almost the sole burden of his investigations.

After five years' unremitting work he "allowed himself to speculate" on the subject, and drew up some short reports which were published under the auspices of the lords of the British treasury in three successive parts: *The Structure and Distribution of Coral Reefs*, in 1842; *Geological Observations on the Volcanic Islands Visited during the Voyage of H. M. S. Beagle, together with some Brief Notices of the Geology of Australia and the Cape of Good Hope*, in 1844; *and Geological Observations on South America*, in 1846.

Of all his contributions to geology, Professor Geikie says that while they have not been epoch-making, "Every one of them bears the stamp of his marvelous acuteness in observation, his sagacity in grouping scattered facts and his unrivaled far-reaching vision that commanded all their mutual bearings as well as their place in the economy of things." The most important part of his geological work has dealt with the forces within and under the earth, those that are effective in earthquakes and volcanoes, in the elevation of mountains and the subsidence of extensive areas of the earth's surface. Out of his geological notes taken on the *Beagle*, he also contributed three papers to the *Transactions of the Geological Society;* one *On the Connection of Volcanic Phenomena;* a second *On the Erratic Boulders of South America;* and a third *On the Geology of the Falkland Islands.*

Of the earliest of his geological papers, that on the *Formation of Mould* is especially curious as showing his unlimited patience and his painstaking habit of reaching conclusions by personal observation. This subject interested him so much that, in 1842, he deposited a layer of chalk on a patch of ground, watched it constantly until 1881, and then wrote the results embodied in his last published work, *Vegetable Mould.* Indeed, so precise and unaffected were his methods of investigation that the passer-by, seeing the grounds and buildings around his home, would have taken him to be a gardener and cattle raiser. Occasionally he made short excursions for study and recreation, and always brought back substantial evidence of industry.

In 1851 and 1854 the Ray society published Darwin's very important *Monograph of the Cirripedia*, two massive volumes, finely illustrated, preserving the results of several years of close inquiry. All his works up to this point embodied in embryo the principle of natural selection, and he had also been assiduously accumulating evidence for a period of twenty-five years in its direct support. With constitutional caution, however, he delayed publication of his hypothesis, which was precipitated by accident.

In 1858 Alfred Russel Wallace sent home from the Malay archipelago a memoir addressed to Darwin; and this, to his surprise, Darwin found to contain in essence the main idea of his own theory of natural selection. Lyell and Hooker persuaded him to read a letter of his own of the previous year simultaneously with Wallace's before the Linnæan society, which was accordingly done on July 1, 1858. Hereupon Darwin set to work seriously at once to condense his vast amount of notes, and put into shape his great work *On the Origin of Species by means of Natural Selection*, published in November, 1859.

The work created a profound sensation throughout the scientific and non-scientific world. The fact that the theory of evolution was an old one was forgotten; and Darwin was assailed as the inventor of that theory, while many of those who perceived that he merely suggested the method by which that theory might be brought within the page of speculative debate carried it far beyond the limits which he, with undeniable modesty and candor, had himself prescribed. That he feared and regretted the disturbance it would effect in the domain of religion is shown by the deprecatory extracts from Whewell, Bacon, and Butler, which precede the title-page, and by the delicacy and respect with which he met the attacks of those who accused him of promoting atheism. *The Origin of Species* was translated into most of the European languages; and the controversy it engendered continued with unabated vigor during the life of the naturalist, who never descended into the arena of the conflict except with a new collection of facts which seemed to sustain it.

Upon the scientific doctrine laid down in *The Origin of Species*—particularly that of "natural selection," or the "survival of the fittest" — has been founded what is popularly known as *Darwinism.* The popular conception, however, that Darwinism is simply the theory of evolution applied to the origin of man, is far from correct. Its novelty lies not in the conception of evolution, but in an exposition of a probable cause of evolution so clear and cogent as to remove the theory from the sphere of philosophical speculation to that of practical life.

The chief contents of *The Origin of Species* may be briefly summed up in a few paragraphs. In this tour around the world, Darwin had been greatly struck by the many peculiarities in the geographical distribution of mammals, and the difficulty of explaining these on the hypothesis of special creation. He shows how largely these difficulties disappear if the theory of evolution is adopted. Similarly, he shows how the theory is supported by the evidence of the rocks; by the evidence derived from the structure of animals, from their life history, and from the occurrence of rudimentary organs — a characteristic otherwise so inexplicable.

Subsequently the author collected a large number of facts showing the variability of domesticated and of wild animals, and in the first case emphasized the fact that man, by artificial selection, has produced new forms — for example among pigeons — which differ from one another so markedly that, if they were wild birds, they would undoubtedly be placed by ornithologists in separate species or even genera. In other words, man has, by artificial selection, produced new species.

Can wild species be supposed to have arisen in a fashion at all analogous? Darwin answers this question in the affirmative by showing that organisms usually increase faster than their means of subsistence; that necessarily there must ensue a struggle for existence; that those forms survive in which variations are in accord with the environment; that the survivors transmit their characters to their descendants, and finally through such survivals extending over innumerable generations the characters of existing species have arisen. This is the Darwinian theory of natural selection.

A point on which Darwin dwelt relatively little, but on which much stress has been laid in later years, is the question of the origin of the variations which form the raw material for the evolutionary process. Darwin, in *The Origin of Species,* accepted the Lamarckian view of the hereditary nature of the effects of use and disuse, one of the points about which fierce controversy has raged in later days; but at first, certainly, he regarded these effects as subservient to natural selection. Speaking generally, we may say that Darwin was concerned with the existence, not with the cause, of variation, and with the endeavor to prove that "the same laws have acted in producing the lesser differences between species of the same genius." In other words, he strove primarily to break down the impassable barrier which the older zoölogists had built up between varieties and species. In speaking of the struggle for existence and the survival of the fittest, Darwin laid great stress on the organic environment of living beings, as in many cases the most important element in deciding the result of the conflict between rival species of varieties.

In the early statements of his theory, Darwin emphasized natural selection as the chief, if not the only effective cause of the peculiarities, but as maintaining their efficiency in each successive generation. Subsequently, he put forward the hypothesis of sexual selection to account for certain characteristics of the male sex, especially in birds, where the cocks have often a beauty of color and of plumage and a power of song not apparently easy of explanation by the action of natural selection alone. The hypothesis of sexual selection has been abandoned by a few avowed evolutionists, but is still maintained by others.

Apart from the chapters in *The Origin of Species* bearing particularly on these biological principles, there are a number of others which deal more with what may be described as the general evidences of evolution than with the theory of natural selection in particular. In regard to these chapters, it can only be said that the progress of knowledge since Darwin first penned their contents has immeasurably strengthened his arguments, and that much of this progress has been directly due to the inspiration of *The Origin of Species.*

From the day of the publication of the latter work, Darwin continued to work on unremittingly at a great series of supplemental treatises. *The Fertilization of Orchids* appeared in 1862, *The Variation of Plants and Animals under Domestication,* in 1868, and *The Descent of Man,* in 1871. The last-named work, hardly less famous than *The Origin of Species,* derives the human race from a hairy quadrumanous animal belonging to the great anthropoid group, and related to the progenitors of the orang-outang, chimpanzee, and gorilla. In it Darwin also developed his important supplementary theory of sexual selection.

In addition to these volumes, his *Emotion in Man and Animals* was published in 1872; *Insectivorous Plants,* in 1875; *Fertilization in the Vegetable Kingdom,* in 1876; *Forms of Flowers,* in 1877; *Movement in Plants,* in 1880; and *The Formation of Vegetable Mould,* in 1881. He wrote many papers, besides, on minor phases of the great scientific issues of the day.

The literary style of his works is so simple and pleasing that he has been read with as lively interest by those who could not accept his conclusions as by his disciples; and the generosity with which he assisted all who sought his aid, his eagerness to acknowledge the merit of the work of others, his silence under personal attack, the universally acknowledged sincerity and love of truth in his character and in his writings, secured the esteem of his contemporaries of all schools of scientific opinion. To the end of his life he continued his painstaking researches and elaborate investigations of the facts of nature. Four years before his death, in 1878, he was accorded the honor of election to the French academy. He died at Down, near Orpington, Kent, April 19, 1882, and was honored with interment in Westminster abbey, London.

Physically, Darwin presented a striking figure. Over six feet in height, with a slight stoop of his high shoulders, with a brow of unparalleled development overshadowing his merry blue eyes, and a long gray beard and moustache — he presented the ideal picture of a natural philosopher. His bearing was, however, free from all pose of superior wisdom or authority. The most charming and unaffected gayety, and an eager innate courtesy and goodness of heart were its dominant notes. His personality was no less fascinating and rare in quality than are the immortal products of his intellect.

His life at Down — now a sacred shrine of naturalists — was ideal from the point of view both of science and domesticity. In a letter to his friend, Captain Fitzroy of the *Beagle*, written in 1846, Darwin says, "My life goes on like clock-work, and I am fixed on the spot where I shall end it." Happily, he was possessed of ample private fortune, and never undertook any teaching work nor gave any strength to the making of money. He was able to devote himself entirely to the studies in which he took delight; and, though suffering from impaired health due to a form of dyspepsia, he presented the rare spectacle of a man of leisure more fully occupied, more absorbed in constant and exhausting labors than many a lawyer, doctor, professor, or man of letters. His voyage seems to have satisfied once for all his need for traveling, and his absences from Down were but few and brief during the rest of his life.

Here most of his children were born, five sons and three daughters. One little girl died in childhood; the rest grew up around him and remained throughout his life in the closest terms of intimacy and affection with him and their mother. Here he carried on his experiments in greenhouse, garden, and paddock; here he collected his library and wrote his great books. He became a man of well-considered habits and method, carefully arranging his day's occupation so as to give so many hours to noting the results of experiments, so many to writing and reading, and an hour or two to exercise in his grounds or a ride, and to playing with his children. His house was large enough to accommodate several guests at a time; and it was his delight to receive here for a week's end not only his old friends and companions, but younger naturalists, and others, the companions of his sons and daughters.

Haeckel, the noted German naturalist, who visited him, has given this brief and vivid picture of his home and its master: "In Darwin's own carriage, which he had thoughtfully sent for my convenience to the railway station, I drove one sunny morning in October, through the graceful hilly landscape of Kent, with the chequered foliage of its woods, its stretches of purple heath, yellow broom, and evergreen oaks, arrayed in its fairest autumnal dress. As the carriage drew up in front of Darwin's pleasant country-house, clad in a vesture of ivy and embowered in elms, there stepped out to meet me from the shady porch, overgrown with creeping plants, the great naturalist himself, a tall and venerable figure with the broad shoulders of an Atlas supporting a world of thoughts, his Jupiter-like forehead highly and broadly arched, as in the case of Goethe, and deeply furrowed by the plow of mental labor; his kindly mild eyes looking forth under the shadow of prominent brows; his amiable mouth surrounded by a copious silver-white beard. The cordial, prepossessing expression of the whole face, the gentle, mild voice, the slow, deliberate utterance, the natural and naïve train of ideas which marked his conversation, captivated my whole heart in the first hour of our meeting, just as his great work had formerly, on my first reading it, taken my whole understanding by storm. I fancied a lofty world-sage out of Hellenic antiquity —

a Socrates or Aristotle — stood before me." Others have borne testimony, equally explicit, to the simple and engaging personality of the man.

In later years his health became so precarious that he was obliged not only to suspend his work for days and even weeks, but also to limit his conversation with visitors, particularly if scientific topics were discussed. His wife, who, throughout their long and happy union devoted herself to the care of her husband so as to enable him to do a maximum amount of work with least suffering in health, would come and call him away after half an hour's talk, that he might lie down alone in a quiet room. Then after an hour or so he would return with a smile, like a boy released from punishment, and launch again with a merry laugh into talk. Never was there an invalid who bore his maladies so cheerfully, or who made so light of a terrible burden.

During the hours passed in his study, even, he found it necessary to rest at intervals, and adopted regularly the plan of writing for an hour and then lying down for half an hour, while his wife and daughter read to him a novel. After half an hour he would again resume his work, and again after an hour, return to the novel. In this way he read the greater part of the circulating libraries' contents. He declared that he had no taste for literature, but liked a story, especially about a pretty girl; and he would read only those in which all ended well. Authors of stories ending in death and failure ought, he declared, to be hung!

He rarely went to London, on account of his health, and consequently kept up a very large correspondence with scientific friends, especially with Lyell, Hooker, and Huxley. He made it a rule to preserve every letter he received, and his friends were careful to preserve his; so that in the *Life and Letters*, published after his death by his son Francis — who in later years lived with his father and assisted him in his work — we have a most interesting record of the progress of his speculations, as well as a delightful revelation of his beautiful character.

"If the proper study of mankind is man," says Professor Romanes, "then Darwin has done more than any other human being to further the most desirable kind of learning, for it is through him that humanity in our generation has first been able to begin its response to the precept of antiquity — *know thyself*." To this, Alfred Russel Wallace adds: "The Darwinian theory, even when carried out to its extreme logical conclusion, not only does not oppose, but lends a decided support to a belief in the spiritual nature of man. It shows us how man's body may have been developed from that of a lower animal form under the law of natural selection; but it also teaches us that we possess intellectual and moral faculties which could not have been so developed, but must have had another origin; and for this origin we can only find an adequate cause in the unseen universe of spirit." Finally, Archdeacon Farrar says: "The glory of Charles Darwin, of which no change of view respecting his theories can rob him, is that he passed through the world with open eyes."

HERMANN LUDWIG FERDINAND VON HELMHOLTZ, physiologist and physicist, and one of the most distinguished scientists of the nineteenth century, was born at Potsdam, near Berlin, Prussia, August 31, 1821. His father was professor of literature in the gymnasium at Potsdam; and his mother, Caroline Penn, was the daughter of a

Hanoverian artillery officer, and a lineal descendant of William Penn, the Quaker founder of Pennsylvania. His grandmother, on his mother's side, sprang from a family of French refugees. So that Helmholtz had German, English, and French blood in his veins.

During the first seven years of his life he was a weakly boy, and frequently confined to his bed. When he was able to attend school he passed through the usual routine of the normal school of Potsdam, where he began the study of geometry in his eighth year, and astonished his teachers by his knowledge of many fundamental truths. A little later he acquired a great love of nature, and was especially attracted to physics. He confesses in his memoirs that while the class was reading Cicero or Vergil, he was often busy with illicit calculations under the desk. He had difficulty in acquiring languages, but, through the enthusiastic encouragement of his father, he became master not only of Greek, French, and English, but even of Arabic.

But, though he describes his interest in the special line of study to which he subsequently adhered as "amounting even to a passion," it is evident that the passion was controlled by a strong vein of common sense. Neither at that time, nor for many years afterward, was a living to be made out of physics. The most influential member of the family was a military surgeon — Surgeon-general Mursinna — who obtained for young Helmholtz, in 1838, admission to the royal medico-chirurgical institute of Berlin, an academy for the medical education of youths of promise, on condition that they afterward become surgeons in the Prussian army. The students of this institution also attended the usual course of instruction in the medical department of the university of Berlin, and were afterward attached for a time to the Charity hospital.

It was not long before the characteristic bent of his mind displayed itself. He was the pupil of the distinguished physiologist, Johannes Müller, from whose laboratory came many of the most distinguished German physiologists of the last generation; and of Gustav Magnus, the almost equally distinguished physicist. Professor Müller was the greatest living force in the university of Berlin, at that time, and, together with Magnus, represented a new school of thought which rebelled against the older metaphysical school. He it was, indeed, that laid the foundations of the modern school of experimental psychology through the publication of his great work on physiology. Under such personal stimulation, Helmholtz laid the foundation of his career. He long afterward wrote words that apply with striking force both to his great master and to himself. "When one comes into contact with a man of the first rank, his spiritual scale is changed for life. Such a contact is the most interesting event that life can offer."

Helmholtz was graduated in medicine in 1842, at the age of twenty-one, and presented a thesis entitled *De Fabrica Systematis Nervosi Evertebratorum*, in which he already made an important contribution to the minute anatomy of nerve cells and fibers. From this date until 1849 he resided the greater part of the time in Berlin and vicinity. In 1843 he took up the active duties of assistant surgeon in the regiment of the Red Hussars, then stationed at Potsdam, but at the instance of Alexander von Humboldt he was relieved from military duties, and became assistant to the anatomical museum, at Berlin, lecturer on anatomy to the academy of arts, and professor extraordinary of physiology at Albert university.

The first of his scientific efforts which attracted general attention was his famous essay on the "Conservation of Force," published in 1847, when he was twenty-six years of age. This essay was first read to the physical society of Berlin, in July of that year, and it proved to be one of the epoch-making scientific contributions of the nineteenth century. In it he enunciated — in brief — as a fundamental principle of physics, the conservation of force, just as Lavoisier, seventy years before, had made that of the persistence of matter the fundamental principle of chemistry. The line of thought which he had been following has been traced by his own hand. The study of medicine led to the problem of the nature of vital force. He convinced himself that if — as the celebrated physiologist, Stahl, had suggested — an animal had the power now of restraining and now of liberating the activity of mechanical forces, it would be endowed with the power of perpetual motion. This led to the question whether perpetual motion was consistent with what was known of natural agencies. The essay on the "Conservation of Force" was, according to Helmholtz himself, intended to be a critical investigation and arrangement of the facts which bear on this point, for the benefit of physiologists. In form, however, it was addressed to the physicists.

It is very evident that the doctrine of the conservation of energy was of the highest importance in physiology, as it indicated the road to a thorough investigation of the nutritional changes occurring in living matter. These nutritional changes, if in the direction of the upbuilding of tissues, are also concerned in the storing up of energy, and if, on the contrary, they are associated with the tearing down of tissue, or, in other words, with chemical decompositions, then energy is set free as mechanical motion, heat, light, or electricity. This was only the third or fourth paper which Helmholtz had published, but his remarkable abilities were now fully recognized.

In 1848 the connection of Helmholtz with the army was permanently severed, and in the following year he was appointed to the chair of physiology and general pathology in the university of Königsberg. Here he spent six busy years, fully engaged in teaching and investigation. Early in this year, also, he married Miss Olga von Velten of Potsdam, who died in 1859, leaving two children, a son and a daughter.

From 1851 to 1856 his researches were mainly confined to physiological optics, with an occasional paper on electrical problems. These studies, which led to a systematic examination of the eye, resulted also in the invention of the myograph, the ophthalmometer, and the ophthalmoscope; and thus made it possible to investigate the inmost recesses of the living eye. The latter invention has been of untold service, and its principle is something as follows:

If the eye be illuminated, a portion of the light returns from the hinder surface, is brought to a focus by the lenses of the eye itself, and forms an image of the retina in external space. To see this was no easy matter. If the patient's eye were focused on a luminous object, the image would coincide with the source of light, and, even if otherwise visible, would be lost in the glare. If the patient looked elsewhere, the image would move, but, inasmuch as the lenses cannot be adjusted to the clear vision of any object nearer than about ten inches, that is the minimum distance from the eye at which it can form the image of its own retina. To see this clearly an observer without appliances must place himself at least ten inches from the image, that is, at twenty inches from the patient. At that distance the view would be so limited that no result could be obtained.

Helmholtz, however, convinced himself that, if these difficulties could be overcome, the image of a brightly illuminated retina could be seen. He made the observations through a small hole in the center of a mirror, which reflected light into the eye under examination. Then by means of a lens he shifted the position of the image backward, until the relative positions of the observer and the patient were such that, according to calculation, the retina should be visible.

Again and again he tried and failed, but he was convinced of the validity of the theory, and at last the experiment succeeded. From that time the oculist has been able to look into the darkness of the pupil, and see through the gloom the point of entry to the optic nerve, and the delicate network of blood vessels by which it is surrounded.

Forced by his persistent work to seek comparative rest, Helmholtz made his first visit to England in 1854, including Scotland, also, in his itinerary, and was greatly benefited in health. He confessed his disappointment in being able to meet but few scientific men during this visit; but he frequently renewed his visits in subsequent years, and formed a large circle of acquaintances. There existed between him and Lord Kelvin, especially, the warmest friendship, and each had high admiration for the powers and achievements of the other.

Helmholtz was appointed professor of physiology at the university of Bonn in 1855, at thirty-five, and here he remained until 1858, when he accepted a similar chair at Heidelberg. The three years at Bonn were characterized by the same intellectual activity as his previous years at Königsberg, but were devoted in the main to physiological acoustics. These investigations also extended into the period of his work at Heidelberg, and, besides many lesser monographs, resulted, in 1863, in his great work on the "Sensations of Tone as the Physiological Basis of Music"—*Tonempfindungen als physiologische Grundlage für die Theorie der Musik.*

It is almost impossible, within brief scope, to give an adequate notion of this celebrated physiological study. The theories advanced were novel, but, though some points are still open to dispute, they have as a whole been generally accepted. The aim of the work was ambitious, being nothing less than the discovery of the physical basis of the sensations which affect us when listening to consonant and dissonant musical intervals, respectively. The general nature of the solution arrived at is now well known.

If two notes, which differ but little from unison, are produced together, throbbing alternations in the intensity of the sound are heard as beats. If the interval is gradually increased, the beats become quicker, until at last they can no longer be distinguished separately. According to Helmholtz, however, they produce the effect of dissonance. "The nerves of hearing," he says, "feel these rapid beats as rough and unpleasant, because every intermittent excitement of any nervous apparatus affects it more powerfully than one that lasts unaltered. Consonance is a continuous, dissonance an intermittent sensation of tone." The disagreeable effect depends in part upon the number of beats, in part upon the interval between the notes which produce them, being greatest when the rapidity of the beats is neither very large nor very small, and when the interval between the two notes is not great.

In applying this theory it is necessary to take into account not only the beats between the two fundamental notes, but also those due to two series of secondary sounds by which they may be accompanied. The presence or absence of one of these — the so-called upper harmonic partials — depends upon the way in which the note has been obtained. They produce the differences of quality which distinguish one musical instrument from another. They are also the basis of our appreciation of the closeness of the relationship between the notes they accompany. The want of perfect consonance between compound notes is attributed to beats between those members of the two groups of sound which are not very far apart on the scale. The growing importance of these beats, as the intervals become less and less consonant, was traced with wonderful ingenuity.

This theory alone would be insufficient to account for a perception of want of consonance between two pure notes unaccompanied by partials. To explain this, recourse was had to a second series of attendant sounds, the most important of which had been discovered in 1845, by Sorge, a German organist, and was well known as Tartini's tone. Helmholtz proved that such notes would arise when the vibrating body was set in somewhat violent motion, provided that the resistances offered to equal displacements in opposite directions were unequal. Of course the air, which transmits the sounds to the ear, does not possess this property. On the other hand, the drumskin of the ear, to which the aerial vibrations are communicated, is not symmetrical, being bent inward by the little "hammer" bone. Helmholtz, therefore, concluded that it is probable that Tartini's tone is due to this membrane. From his point of view it is subjective, in the sense that it is produced within the organism, though it originates in the auditory apparatus, and not in the brain. It is, if one may use the phrase, the rattling of the machinery of the ear.

Having thus accounted for the production of secondary sounds by tones which were themselves unaccompanied by partials, Helmholtz explained our sense of the dissonance of imperfect intervals, when produced by such pure notes, by beats due to the combinational tones. But though he maintained that these theories explained the physical "reason of the melodic relationship of two tones," the author of the *Tonempfindungen* was careful to point out that the principles he enunciated had not always determined the construction of the scale, and do not determine it everywhere now. The selection of a series of notes, which were from experience found to obey certain natural laws, was voluntary. The scale itself is not natural, in the sense that it is not a necessary consequence of the construction of the ear. On the contrary, it is the product of artistic invention.

Music is thus not a mere branch of mechanics, but an art. The architect and the composer alike deal with materials which are subject to mechanical laws, but they are alike free to fashion from these, forms determined, not by calculation, but by the sense of beauty.

Helmholtz was at work on optics while still engaged in the study of sound. The "Handbook of Physiological Optics"— *Handbuch der Physiologischen Optik* — appeared in sections in 1856, 1860, and 1867. It is, as he himself has said, a complete survey of the whole field of that science. He also lectured before the royal society of Great Britain in 1864, and from 1865 to 1871 produced a series of "Lectures on Scientific Subjects" that represent the highest class of that form of literature in any language. These were published in 1873.

On the death of Professor Magnus, the physicist of the university of Berlin, it was felt that only one of two men could take his place — Kirchhoff, one of the founders of spectrum analysis, or Helmholtz, both then at Heidelberg. The authorities would not allow Kirchhoff to leave, so the chair was offered to Helmholtz. He accepted with some reluctance, in 1871, for he loved the wooded hills around Heidelberg and the old romantic town as well, but he yielded to the entreaties of his friends with pride and satisfaction.

He had now raised himself to the position of being the first physicist in Germany, and his fame extended throughout the entire scientific world. During the last twenty-three years of his life, he devoted his energies almost entirely to the investigation of physical problems. His contributions to the theory of electrodynamics are of the greatest importance, and he carried the work begun by Clerk Maxwell to practical results equaled by no other physicist. It was through him that Hertz demonstrated the existence of the electromagnetic waves foreshadowed by Maxwell. In his discussion of "monocyclic" systems and in other papers, he endeavored to find the real essence of the principle of least action, and was the first to work out explicitly the notion of the electric atom or electron.

An account of these researches would far exceed the limits of this sketch, and we can only say that they may be summed up under the following heads: (1) On the conservation of energy; (2) On hydrodynamics; (3) On electrodynamics and theories of electricity; (4) On meteorological physics; (5) On optics; and (6) On the principles of dynamics. His last paper was given to the world in 1894, the year of his death, and gave an accurate explanation of "Sensory Impressions." From 1842 up to this year he published two hundred seventeen distinct papers and books, in which he demonstrated a triple mastery over anatomy, mathematics, and physics, equaled by few, and won a place on the borderland of physics, physiology, and psychology that is all his own.

From 1887 until the close of his career, Helmholtz devoted much time and attention to the affairs of the Physikalisch-Technische Reichanstalt, or physico-technical institute, at Charlottenburg, near Berlin. This institution — which has since developed into one of the most noted in the world — was practically founded in 1884 by his life-long friend, Werner von Siemens, the electrician and man-of-affairs, as a research laboratory, and he was chosen its first director in the year mentioned. This did not necessitate the resignation of his chair at Berlin, but added measurably to his administrative work to which he attached great importance because it was public work.

In 1861 Helmholtz had entered upon a second marriage, when he wedded Miss Anna von Mohl, the daughter of a Württemberg family of high social position. This marriage resulted in a happy home life for him, as well as in the creation of a brilliant social, artistic, and intellectual circle. Two children were born of this union, a son and a daughter. The latter knit together the families of Siemens and Helmholtz by marrying the son of Werner von Siemens.

The technical institute having become a Prussian state institution shortly after Helmholtz assumed its direction, he was frequently brought into contact with the emperor, who received him in his domestic circle to discuss the advances of the arts and sciences. He was also warmly received by William I., during the latter years of his reign, by whom he was ennobled in 1883. Honors of all sorts, indeed, were showered upon him, and the celebration of his seventieth birthday became a national event. The tribute that was then paid to his eminence as a man of science and as an inspiring teacher was only equaled a few years ago by the ceremonies at the jubilee of his friend, Lord Kelvin. The emperor William II. sent him an autograph letter in acknowledgment of his great services to science, and conferred special honors upon him. The kings of Sweden and Italy, the grand duke of Baden, and the president of France sent him the insignia of various orders. Representatives of academies, universities, and learned societies sent representatives and addresses. A Helmholtz gold medal was struck in his honor, to be awarded from time to time for distinguished services to science, and was, at a banquet, handed to Helmholtz himself as its first recipient, after a brilliant speech by his life-long friend, Du Bois Reymond. At the same time a marble bust by Hildebrand was unveiled.

At seventy his eye was undimmed and his natural force was unabated, and it was hoped that he had yet many years before him to complete his life work by the publication of his later lectures. He attended the meeting of the British association for the advancement of science in Edinburgh, in 1892, in 1893 visited the World's Columbian exposition at Chicago, and afterward saw something of the grand scenery of North America and Canada. He then started on his homeward journey.

Shortly before his steamer reached Hamburg, Helmholtz had an attack of giddiness, and fell down the stair of the cabin. The injury was severe, and caused concussion of the brain, and great loss of blood from a scalp wound. He apparently recovered so far as external appearances were concerned, but those about him saw that his strength was failing. Now easily tired, work became more and more difficult. At last the brain that had worked so well gave way, and, in July, 1894, he had a stroke of apoplexy. He lingered for two months, patiently and calmly looking forward to the end. This came on September 8, 1894, when he had lived eight days beyond his seventy-third birthday.

The personal appearance of Helmholtz was indicative of his own inner strength. Rather above the middle stature, he had a firm, erect frame. His splendid head was well thrown back, so that his posture was always sure to command attention. The shape of the head was perfect, broad between the eyes but not out of proportion. His eyes were full of intelligence, and not so brilliant as deep and reflective. They often had that far away look so conspicuous in thinkers, as if the soul were away on its own quest. His manner was dignified, almost to coldness, but it was at the same time courteous. It is said that he had occasionally a peculiar look that caused a shallow man to stop asking questions and to feel his own unworthiness. With those who were truly in earnest he would take infinite pains to explain, listen to suggestions, and remove difficulties. Reserve was his habitual attitude. To his favorite students, and in the circle of his own friends, there was always the charm of a great personality.

He loved a quiet home life with the pleasures of congenial society and music, to which he was devoted. He was an accomplished pianist, and he sang a little, but his voice was not strong. He was also fond of mountaineering and was an excellent swimmer.

It is not necessary to define the position of Helmholtz among scientific thinkers. His works bear their own evidence. There is a general consensus of opinion that he was one of the greatest men of the nineteenth century. To find one like him in mental power and range we must go back to such intellectual giants as Descartes and Leibnitz, and, even when he is compared with them, it must not be forgotten how enormously broader was the field of science in the time of Helmholtz than in the seventeenth century.

Of Helmholtz's opinions on religious questions nothing can be stated with any degree of precision. Such topics were not with him subjects of conversation. But throughout his writings there breathes a spirit of reverence, while his noble and pure life is the highest testimony to his true worth. For such a man a time surely comes when

"That in us which thinks and that which feels
Shall everlastingly be reconciled,
And that which questioneth with that which kneels."

The technical merits of his work will, of course, be appreciated chiefly by experts. Special knowledge is not necessary to understand its importance. He was one of the first to grasp the principle of the conservation of energy. He struck independently, and at a critical moment, a powerful blow in its defense. He penetrated further than any before him into the mystery of the mechanism which connects us with external nature through the eye and the ear. He discovered the fundamental properties of vortex motion in a perfect liquid, which have since not only been applied in the explanation of all sorts of physical phenomena, of ripple marks in the sand, and of cirrus clouds in the air, but have been the bases of some of the most advanced and pregnant speculations as to the constitution of matter and of the luminiferous ether itself.

These scientific achievements are not, perhaps, of the type which most easily commands generation attention. They have not been utilized in theological warfare; they have not revolutionized the daily business of the world. It will, however, be universally admitted that such tests do not supply a real measure of the greatness of a student of nature. That must finally be appraised by his power of detecting beneath the complication of things as they seem something of the order which rules things as they are. Judged by this standard, few names will take a higher place than that of Hermann von Helmholtz.

LORD KELVIN

A. D.		AGE
1824	Born at Belfast, Ireland,	..
1845	B. A., Cambridge university,	21
1846–99	Professor of natural philosophy, university of Glasgow,	22–75
1857–58	Electrical engineer of Atlantic cables,	33–34
1865–66	Electrical engineer of Atlantic cables; knighted,	41–42
1867	*Treatise on Natural Philosophy* (with Professor Tait),	43
1882–90	*Mathematical and Physical Papers*,	58–66
1884	Visited America; lectured at Johns Hopkins university,	60
1889–94	*Popular Lectures and Addresses*,	65–70
1890	President of the royal society,	66
1892	Raised to the peerage, as the first Lord Kelvin,	68
1897 and 1902	Revisited America,	73; 78
1907	Died at Largs, Scotland,	83

SIR WILLIAM THOMSON, first LORD KELVIN, celebrated both as a physicist and mathematician, was born at Belfast, Ireland, June 26, 1824. His father, James Thomson, was a descendant of a Scottish farmer who had settled in County Down, Ulster, Ireland, and for many years was professor of mathematics at the royal academical institution in Belfast.

William was one of seven children — four sons and three daughters. In 1832, when eight years of age, his father removed to Glasgow to accept a professorship in mathematics at the university there. He received his early education from his father, at the age of ten was sent to school, and a year or so later entered Glasgow university. Here he soon distinguished himself in mathematics, mental science, and the classics, and in 1841 he went to St. Peter's college, Cambridge.

At Cambridge, as in Glasgow, he was noted for his remarkable enthusiasm and attainments, not in science alone, but in many other departments of scholarship. He was placed second among the wranglers, gained the highest of the mathematical honors, and received his degree of B. A. in 1845, at the age of twenty-one, and was elected fellow of his college. In social and physical recreations he participated enthusiastically, as well, and enjoyed to the full the many-sided life of the old English university. He was president of the university musical society, won the Colquhoun sculls, and rowed in his college boat when second in the Cambridge races.

From Cambridge he went to Paris, studied for a time under the famous Regnault, and continued the valuable original contributions to science which he had begun at Cambridge. His early papers are remarkable and contain many germinal ideas developed in his later work. His first published paper, written at the age of sixteen and dated Frankfort, July, 1840, Glasgow, April, 1841, appeared in the Cambridge *Mathematical Journal*, May, 1841. It was a defense and elucidation of certain fundamental theorems in Fourier's work on harmonic analysis, the truth of which had been questioned by Kelland. This he followed up in 1842 by a paper *On the Uniform Motion of Heat in Homogenous Solid Bodies, and its Connection with the Mathematical Theory of Electricity.*

In this he displayed some of the spirit since recognized as characteristic of his work. Pointing out the analogy between the flow of heat in solid bodies and the theory of electric and magnetic attraction, he made use of known theorems in heat in order to obtain solutions of problems in electricity and magnetism. His results had, as he afterward heard, been anticipated by others, but the method which he adopted was entirely original, and proved a fruitful conception in electric and magnetic problems.

In 1846 he was appointed professor of natural philosophy in Glasgow university in succession to Dr. Meikleham. In the years which followed, during his early occupancy of this chair, Lord Kelvin was largely occupied, in constant association with Joule, with the development of thermodynamics, to which not his least contribution was the theory of the dissipation of energy. This was followed by investigations into electrostatics and the theory of magnetism, contact electricity, thermoelectricity, the mechanical energies of the solar system, the calculation of the tides, the size of atoms, and vortex motion.

That which, however, directed popular attention to his scientific attainments was not so much these deep investigations as his connection with the more practical problems of ocean telegraphy. The possibility of an Atlantic cable was, in the early 'fifties of the nineteenth century, a much-discussed question; and when the actual work of construction began on the first cable, in 1857-58, Kelvin was given the most important post of electrical engineer to the cable company. His mathematical investigation, in fact, of the conditions governing the propagation of signals in long submarine cables proved to be the most important contribution to the practical solution of that problem. He showed that the retardation must be proportional to the square of the length of the cable; and, further, he applied the theorems of Fourier to predict the degree of attenuation of the impulses on their arrival at the distant end. This was followed by his invention of the mirror galvanometer, and later by the siphon recorder, which he used to insure the final success of the Atlantic cables of 1865 and 1866, laid under his direction. These proved a triumph for his inventive ingenuity no less than for his mathematical skill and insight. During this momentous enterprise, his contact with nautical matters led him, also, to devise the method of taking flying soundings, and to publish a set of tables for facilitating the use of Sumner's method at sea.

After the Atlantic cable, Lord Kelvin's most popular achievement was the invention of the present mariner's compass. In 1874 he began to contribute articles on the mariner's compass in *Good Words*, but the second article did not appear until five years later. In the interval he had been working at an improved compass of his own. He has told us how when writing the first paper he became alive to the faults of existing compasses, and set himself to produce one steadier at sea than the others, and to correct the error arising from the magnetism of the ship. "When there seemed a possibility of finding a compass which should fulfill the conditions of the problem," he writes, in his *Popular Lectures and Addresses*, "I felt it impossible to complacently describe compasses which perform their duty ill, or less well than might be, through not fulfilling these conditions."

He sent his compass, when completed, to Sir George Airy, the noted British astronomer, at the royal observatory, for his inspection, but Sir George, after examining it, shook his head and said, "It won't do." When Lord Kelvin heard of this he merely remarked, "So much for the astronomer-royal's opinion." The admiralty also rejected the invention with the usual rigid intelligence of a government department; but it was not long before his radical improvements established the superiority of his compass to all earlier forms.

As early as 1842 Lord Kelvin had published the germ of his theories about the age of the earth. This was in a paper on the linear motion of heat which appeared in the Cambridge and Dublin *Mathematical Journal.* This same subject he had made the topic of his inaugural lecture in 1846, on taking up his professorship at Glasgow. He returned to it in 1876 as the theme of his address as president of the physical and mathematical section of the British association at Glasgow. To the geologists who demanded unlimited time for the operation of these formative actions, which, on the abandonment of catastrophic notions, they had assumed to proceed with constant uniformity, Lord Kelvin announced with the utmost confidence that they must hurry up their phenomena, since the age of the earth as a habitable planet, so far from being unlimited, could not possibly exceed four hundred millions of years, and was more probably within twenty millions of years.

The proposition was supported by several converging lines of argument. The surface temperature could not be what it was, considering the average conductivity of rocks and the gradient of temperatures found underground, if the cooling process had proceeded from an unlimitedly long anterior date. The heat of the sun itself must be constantly dissipated, and its temperature drops; and with the cooling of the sun the earth also cools. Its form, its relation to centrifugal forces, was incompatible with the hypothesis of an unlimited time since it was a fluid mass. The controversy which arose, as the biologists and geologists endeavored to combat these arguments, lasted for a quarter of a century; and the end is indeed not yet.

In 1851 Lord Kelvin, impelled by the characteristic precision of his scientific character, and urged by the needs of exact measurement in telegraphy, had already adopted the absolute system of measurement initiated by Gauss, and extended by Weber. In Lord Kelvin's hands the absolute system of measurement, and with it the adoption of the metric system of standards, became almost an article of creed. In season and out of season he urged the superiority of the decimal measures over the ordinary British ones; and, consistently, he strove to bring all scientific measurements into terms of the fundamental metric units of length, mass and time. Moreover, toward the end of the 'fifties, electric measurement, in the hands of the cable engineers, had become much developed, and instruments of a precision exceeding anything then known in the physical laboratory had been devised for practical use.

In 1861 he secured the appointment by the British association of a committee on electrical standards, a committee of which Wheatstone, Matthiessen, Fleeming Jenkin, and, later, Siemens, Clerk Maxwell, Joule, and Carey Foster were also members. Year after year this committee, with younger men added, produced its reports, with little intermission, and the system of units which it evolved is practically that which is internationally recognized and of legal force to-day. The acceptance and rapid development of the international system, based on the centimeter, the gram, and the second, is due to Lord Kelvin more than to any other man.

After the adoption of the new units by the international congress at Paris in 1881, Lord Kelvin devoted much attention to the production of commercial instruments for the measurement of current, potential, and electric power. Relying confidently on the rightness of abstract principles, he produced a series of ampere balances for currents of different strengths, thus putting into the hands of practical engineers a set of instruments of remarkably great accuracy and of remarkable range. When occupied with the tides, in the 'seventies, he had devised a machine for analyzing the harmonic components of the periodic tidal variations, the essential part of this harmonic analyzer being a mechanical integrating device of globe, disc, and cylinder, first suggested by his brother, Professor James Thomson. It seemed a bold thing to apply such mechanism to evaluate the integrals indicated by Fourier's analysis; but Kelvin's machine justified the hardihood of the conception.

When in the 'eighties he had before him the problem of constructing an electricity meter which should continuously integrate the varying product of current and voltage of an electric supply, he again had recourse to the same integrating mechanism. And here it may be remarked that it is to Lord Kelvin's evidence before the British parliamentary committee, in 1879, that we owe the creation of the unit of electric energy — the value of one thousand volt-ampere-hours. It was once proposed to denominate this unit — now universally employed — by the name of one "kelvin." Lord Kelvin's innate modesty, however, caused him to reject the suggestion. But the time has since come when it is not at all necessary to incorporate his name in such fashion into the international system. It is already indissolubly linked with those of Volta, Ampère, Ohm, Coulomb, Watt, Faraday, Joule, Henry, Gauss, and others, as the creator of the science of electricity.

Of Lord Kelvin's later work on molecular physics, the "tactics of a crystal," the problems of æolotropic elasticity in relation to optical as well as to magnetic and electric phenomena, it is less easy to speak. The lectures which he gave before the Johns Hopkins university at Baltimore in 1884 to "his twenty-one coefficients" — the members of the group of accomplished physicists who then sat at his feet day after day — while he led them through the mazes of the elastic-solid theory and the newly invented spring-shell molecule, remain a witness to his extraordinary fertility of intellectual resource. All his life he had been endeavoring to discover a rational mechanical explanation for the most recondite phenomena — the mysteries of magnetism, the marvels of electricity, the difficulties of crystallography, the contradictory properties of ether, the anomalies of optics. And during the preceding decade he had been confronted with a great generalization which did not fit in with this method of intellectual apprehension, which had become to him instinctive.

While Kelvin had been seeking to explain electricity and magnetism and light mechanically, or as mechanical properties, if not of matter, at least of ether, the celebrated physicist, Clerk Maxwell, had boldly propounded the electromagnetic theory of light, and had drawn all the younger men after him in acceptance of the wave theory. Lord Kelvin had never accepted Maxwell's theory; and his *Baltimore Lectures*, ranging from the most recondite problems of optics to speculations on crystal rigidity and molecular dynamics, were both a criticism and a protest regarding the ultimate dynamics of physical nature.

During the last few years of his life Lord Kelvin himself revised these lectures, enriching them with a variety of new materials, and coördinating the old. He was intensely interested in the new problems raised by the discovery of radium; and in its astonishing property of continuously emitting heat. He combated strenuously the hypothesis that this was to be explained by a spontaneous decomposition of the atom; and to the very last he was seeking for other explanations. He brought to bear on these things the same illuminating genius, the same keen analytical instincts, that he had shown throughout his long career.

The laboratory which the great professor created in Glasgow university (begun in a wine cellar) is described as the finest of its kind in existence and certainly unique. "It is a repository of the most accurate and delicate instruments of his own invention — electrometers, compasses, sounding machines, wattmeters, and other apparatus embodying the perfection of mechanical and geometrical adjustment." The Kelvin patents are said to number upward of fifty; and a large workshop in Glasgow, with several hundred workmen and a staff of electricians, is still employed in their manufacture. From these, long before the end of his long life, he reaped an independent fortune, which enabled him to surround himself with all the luxury that wealth and culture, supplemented by extraordinary art and scientific instincts, could devise. His house adjoining the Glasgow university buildings was one of the first to be lighted in Great Britain with incandescent electric lights, if not indeed the very first, and in contradistinction to his private seat, "Netherhall," at Largs, used to be a veritable home of scientific curiosities.

During the latter part of his life Lord Kelvin lived much in London, where his amiable personality, as well as his scientific position, made him a very well-known figure. He was knighted in 1866, after the completion of the Atlantic cable. The peerage — an unusual honor in the annals of science — was conferred on him in 1892, following his election to the presidency of the royal society in 1890; and in 1902 he was made a member of the British privy council. Previously he celebrated the jubilee of his professorship at Glasgow, in 1896, after a magnificent service of half a century, and received from the French academy of sciences the Arago gold medal. This jubilee was perhaps the most memorable tribute ever paid to the scientific achievements of one man, and also the most singular testimony to the cohesion of men of science all over the world. Three years later he severed his long connection with the university and retired to his splendid country seat, "Netherhall," at Largs, in Ayrshire, on the river Kelvin, from which he took his title.

Lord Kelvin paid his first visit to the United States in 1884. He attended the meeting of the British association at Montreal, Canada, in that year, and subsequently delivered a course of lectures before the Johns Hopkins university, Baltimore, which were published under the title of the *Baltimore Lectures*. In 1897 he again visited both Canada and the United States, and several of the leading universities of both countries. His last visit to this country was in 1902, five years before his death at Largs, on December 17, 1907. He was honored with burial at Westminster abbey, London.

In 1852 he married Margaret, daughter of Walter Crum, Esquire, F. R. S. She died in 1870. Subsequently, he married a daughter of C. R. Blandy of Madeira, who shared the many scientific and social honors which his later career brought, and survived him at his death.

His chief publications were a *Treatise on Natural Philosophy*, which he wrote in conjunction with Professor P. G. Tait, and issued in 1867; *Mathematical and Physical Papers*, published 1882–90; *Popular Lectures and Addresses*, 1889–94; *Molecular Tactics of a Crystal*, 1894; and the *Baltimore Lectures*, delivered in 1884, in the later revision of which he practically abandoned his famous vortex theory of atoms.

The judgment of the future will probably rank Lord Kelvin, with Helmholtz, as one of the greatest scientific intellects of the latter half of the nineteenth century. Indeed, to two generations, if not three, of scientific men his work, his presence, his mathematical genius, his enthusiastic faith in first principles, and his unfailing gentle courtesy were an inspiration and a perpetual stimulus. For nearly sixty years he strove earnestly, patiently, incessantly and successfully to extend our knowledge of nature, and to apply it in the service of man. Besides having the power to apply theory, he had the instinct to make the application commercially practicable. Thus one could always see in his case a three-fold process at work; brilliant theory, application of theory, and the business-like capacity to secure that the invention should be of some use to "the man in the street." There was, possibly, no one in whom these qualities were more manifestly mingled than in Lord Kelvin.

327–324	Invaded India, ...	29–32
323	Returned to Babylon; projected fresh conquests, ...	33
323	Died at Babylon, ...	33

ALEXANDER THE GREAT, or ALEXANDER III., of Macedon, one of the greatest military commanders of history, was born at Pella, the capital of Macedonia, in the autumn of 356 B. C. He was the son of King Philip of Macedon, and Olympias, daughter of Neoptolemus of Epirus, who claimed descent from Achilles. Endowed by nature with a happy genius, he early displayed his great character. Philip's triumphs saddened him. On one occasion he exclaimed: "My father will leave nothing for me to do."

His education was committed first to Leonidas, a maternal relation, then to Lysimachus, and, about 342 B. C., to Aristotle. This great philosopher withdrew him to a distance from the court, and instructed him in every branch of human learning, especially in what relates to the art of government, while at the same time he disciplined and invigorated his body by gymnastic exercises. As Macedon was surrounded by dangerous neighbors, Aristotle was anxious to inspire his pupil with military ardor, and with this in view recommended him to study Homer's *Iliad*, a revision of which he himself undertook for his use. Alexander was very fond of the *Iliad*, and especially of the good character of Achilles. He always remained a lover of books and of knowledge, and in the course of his conquests, even, he is said to have made collections of natural history for the studies of Aristotle.

Alexander was sixteen years old when his father marched against Byzantium, and left the government in his son's hands during his absence. Two years afterward Alexander displayed singular courage at the battle of Chæronea, 338 B. C., where he overthrew the sacred band of the Thebans, and the Macedonian supremacy in Greece was thereby established. "My son," said Philip, as he embraced him after the conflict, "seek for thyself another kingdom, for that which I leave is too small for thee." The father and son quarreled, however, when the former repudiated Olympias. Alexander took part with his mother, and fled, to escape his father's vengeance, to Epirus; but receiving his pardon soon afterward, he returned, and accompanied him in an expedition against the Triballi, when he saved his life on the field.

The greatest design of Philip was to conduct an expedition of all the Greeks, under his own leadership, against the luxurious despotism of Persia, which had thrown its portentous shadow over Hellas. His ambition was to avenge the invasion of the famous Persian leaders, Darius and Xerxes — the victories of Marathon and Salamis and Mycale must be followed by Greek victories in the very heart of the invaders' own empire, so that the culture and civilization of the Greeks might thus be made safe from the fear and repetition of like perils.

Accordingly, Philip was appointed commander-in-chief of all the Greek, or Hellenic, forces, and had completed his preparations for the Persian invasion, when he was assassinated. Alexander ascended the throne in 336 B. C., and immediately punished his father's murderers. He then went into the Peloponnesus, and, in a general assembly of the Greeks, was appointed to succeed his father in command of the forces against Persia.

On his return to Macedon, he found the Illyrians and Triballi up in arms, whereupon he marched against them, forced his way through Thrace, and was everywhere victorious. But now the Thebans had been induced, by a report of his death, to take up arms, and the Athenians, stimulated by the eloquence of Demosthenes, were preparing to join them. To prevent this coalition, Alexander marched against Thebes in 335 B. C., which, refusing to surrender, was conquered, and razed to the ground; six thousand of the inhabitants were slain, and thirty thousand sold into slavery, the house and family of the poet, Pindar, alone being spared. This severity struck terror into all Greece. The Athenians were treated with more leniency, Alexander only requiring of them the banishment of Charidemus, who had been most bitter in his invectives against him.

Alexander, having appointed Antipater his deputy in Europe, now prepared to prosecute the war with Persia. He crossed the Hellespont in the spring of 334 B. C., with thirty thousand foot and five thousand horse, attacked the Persian satraps at the river Granicus, and gained a complete victory, overthrowing the son-in-law of Darius with his own lance. The only real resistance the Macedonians met with was from the Greek auxiliaries of the Persians, who were marshaled in phalanxes under the command of Memnon of Rhodes, but finally they were all slain except two thousand, who were taken prisoners. Alexander celebrated the obsequies of his fallen warriors in a splendid manner, and bestowed many privileges on their relations. Most of the cities of Asia Minor, Sardis not excepted, opened their gates to the conqueror, nor did Miletus or Halicarnassus offer longer resistance.

Alexander now restored democracy in all the Greek cities, and proceeded to the conquest of Lycia, Ionia, Caria, Pamphylia, and Cappadocia, cutting the Gordian knot with his sword as he passed through Gordium. His career was checked for a time by a dangerous illness, brought on by bathing in the Cydnus. On this occasion he received a letter from Parmenio, insinuating that Philip, his physician, intended to poison him, having been bribed by Darius. Alexander handed the letter to Philip, and at the same time swallowed the draught which had been prepared for him.

As soon as he recovered and had been joined by reinforcements from Macedon, he advanced toward the defiles of Cilicia, in which Darius had stationed himself with an army of six hundred thousand men. He arrived in November, 333 B. C., in the neighborhood of Issus, where a famous battle took place between the Greeks and the Persians. The disorderly masses of the Persians were thrown into confusion by the charge of the Macedonians, and fled in terror. On the left wing, thirty thousand Greeks in the pay of the Persian king held out longer, but they, too, were at length compelled to yield. All the treasures as well as the family of Darius fell into the hands of the conqueror, who treated the latter with the greatest magnanimity.

The king, who fled toward the Euphrates, twice made overtures of peace, which Alexander haughtily refused, saying that Darius must regard him as the ruler of Asia, and the lord of all his people. One of the conditions of the second overture was that Alexander should possess all Asia west of the Euphrates. On hearing this his general, Parmenio, exclaimed: "I would do it, if I were Alexander." "So would I," replied the monarch, "if I were Parmenio."

The victory at Issus opened the whole country to the Macedonians, and decided the fate of the Persian empire. Alexander now turned toward Syria and Phœnicia, to cut off Darius' escape by sea. He occupied Damascus, where he found princely treasures, and secured to himself all the cities along the shores of the Mediterranean. Tyre, confident in its strong position, resisted him, but was conquered and destroyed, after seven months of incredible exertion, in 332 B. C.

Thence Alexander marched victoriously through Palestine, where all the cities submitted to him except Gaza, which shared the same fate as Tyre. The story told by Josephus that, on his way to Egypt, he visited Jerusalem is not confirmed by other historians. Egypt, weary of the Persian yoke, welcomed him as a deliverer. In order to strengthen his dominion here, he restored all the old customs and religious institutions of the country, and in the year 332 B. C. founded Alexandria, which became one of the first cities of ancient times. Thence he marched through the Libyan desert, in order to consult the oracle of Jupiter Ammon, whose priest saluted him as a son of Jove.

Meanwhile, Darius had assembled another army, and at the return of spring Alexander went against him in Assyria. A battle ensued in October, 331 B. C., on the plains of Arbela, or rather Gaugamela, for Arbela, the point to which Alexander pursued the Persians, is fifty miles from the scene of the fight. Notwithstanding the immense superiority of his adversary, who had an army said to have amounted to more than one million men, Alexander was not for a moment doubtful of victory. Heading the cavalry himself, he rushed on the Persians, and put them to flight; but, as soon as he had entirely dispersed them, he hastened to the assistance of his left wing, which, in the meantime, had been sorely pressed. He was anxious to make a prisoner of the Persian king himself, but the latter escaped by flight on horseback to Ecbatana (Hamadan), in Media, leaving his baggage and all his treasures a prey to the conqueror. During the following two years Media, Parthia, and Bactria had fallen before him.

Alexander, as the conqueror of Asia, now assumed the pomp and splendor of an Eastern despot, and, proceeding to Babylon, Susa, and Persepolis, was received by the inhabitants as their undoubted sovereign. His marvelous successes began to dazzle his own judgment, and to inflame his passions. He became a slave to debauchery, and his caprices were as cruel as they were ungrateful. In a fit of drunkenness, and at the instigation of Thaïs, an Athenian courtesan, he set fire to Persepolis, the wonder of the world, and reduced it to a heap of ashes; then, ashamed of his deed, he set out with his cavalry to pursue Darius. Learning that Bessus, the satrap of Bactriana, held the king a prisoner, he hastened his march in the hope of saving him, but he found him mortally wounded on the frontiers of that country, 330 B. C.

He mourned over his unfortunate enemy, and caused his body to be buried with all the usual rites observed in Persia; but he pursued Bessus, who himself aspired to the throne, through Hyrcania, Iran, Bactriana, over the Oxus to Sogdiana (now Bokhara), whose satrap, Spitamenes, surrendered Bessus to him. Having discovered a conspiracy in which the son of Parmenio was implicated, he put both father and son to death, though Parmenio himself was innocent of all knowledge of the affair. This cruel injustice excited universal displeasure.

In 329 B. C. he penetrated to the furthest known limits of northern Asia, and overthrew the Scythians on the banks of the Jaxartes. In the following year he subdued the whole of Sogdiana, and married Roxana, whom he had taken prisoner. She was the daughter of Oxyartes, one of the enemy's captains, and was said to be the handsomest of the virgins of Asia. A new conspiracy broke out against Alexander, at the head of which were Hermolaus and Callisthenes, a pupil of Aristotle, which occasioned the death of many of the culprits; while Callisthenes himself was mutilated, and carried about in an iron cage through the army, until some one put an end to his sufferings by poison.

In the year 327 B. C. Alexander proceeded to the conquest of India, then known only by name. He crossed the Indus near to the modern Attock, and pursued his way under the guidance of a native prince to the Hydaspes (modern Jhelum), where he was opposed by Porus, another native prince, whom he overthrew after a bloody contest. Thence he marched as lord of the country through that part of India which is now called the Punjab, establishing Greek colonies. He then wished to advance to the Ganges and conquer the whole of India, but the general murmuring of his troops obliged him, at the Hyphasis (modern Sutlej), to commence his retreat.

Returning to the Hydaspes, he there built a fleet and sailed down the river, receiving, as he proceeded, the submission of the inhabitants on either side. He then marched through the deserts of Gedrosia into Persia, the hardships of this march costing him enormous losses. Meanwhile, his friend, Nearchus, who was made admiral of the fleet, had successfully accomplished the hazardous voyage from the Indus up the Persian gulf to the Euphrates.

They met again at Susa, where rest was to be taken, and some important measures to be adopted with a view to as complete a union as possible of the Greek and Asiatic races. One of these measures was the intermarriage of the Macedonian soldiers with Asiatic women. A great festival was held, in which Alexander set the example by marrying Statira, daughter of Darius, his principal officers taking as their wives noble Persian and Median ladies. Ten thousand private soldiers followed these high examples.

Susa witnessed, also, another astonishing spectacle of a very different kind — the voluntary death of the Indian philosopher, Calanus, by burning on a funeral pile. He was past seventy, and, being seized with illness for the first time, chose to die rather than prolong a useless life by artificial means.

Alexander had now shortly to deal with serious discontents among his troops. A mutiny broke out, which by remorseless resolution he quelled, and ten thousand veterans were discharged. After this he marched to Ecbatana, where his special friend, Hephæstion, died; and in the spring of 323 B. C. he returned to Babylon, which was to be the capital of his vast empire. He had now attained the climax of his glory; but there were signs that he had not passed unharmed through the ordeal of success. His grief over the death of Hephæstion was carried to a wild excess; and the mourning and funeral ceremonies were on a scale of stupendous extravagance. For himself he now claimed divine honors, and they were conceded. But energy and activity did not fail. His imagination was busy with vast new projects, and his subjects were preparing to carry them out. He was contemplating, and would doubtless have effected, the conquest of Carthage and of Italy, where Rome had just entered on the Samnite war. He was gay at banquets and drank to excess. Meanwhile, there were fluttering about him presages and omens that gave him pause; fever laid its hand upon him. On the twentieth day of his illness he ordered his bed to be moved near the great bath. Here he talked to his generals about vacancies in the armies, desiring them to be filled with experienced officers. On the twenty-fourth day he was much worse, but was carried to assist at the sacrifice. On the twenty-eighth, in the year 323 B. C., he died; and shortly thereafter his body was deposited in a golden coffin at Alexandria, by Ptolemæus.

The life of Alexander forms an important epoch in the history of mankind, and marks the zenith of Macedonian power. His life reached scarcely thirty-three years. His reign was less than thirteen. Such achievements as his in so brief a space are unparalleled.

Before the Macedonian era, Greece, so far from doing anything toward incorporating the ancient world, had utterly failed in the necessary preliminary of unifying herself. Nay, she had become more and more incapable of it; for if it had ever been possible it was at the moment of the repulse of Xerxes. After Epaminondas, every Greek community was stale and used up. Yet never was Greece more military. Only, instead of serving as citizen soldiers, the warlike spirits were mercenaries roaming over Greece and Asia, and ready to fight for any one who would pay them. It was time that the task of incorporation should be taken up from without.

The Macedonians were of the same stock as the Greeks. Their language probably did not differ from Greek more than French does from Italian. Their manners and institutions were simply those of the Homeric age. In short, they were just backward Greeks. Yet in the eyes of their vain and arrogant kinsmen they were foreigners speaking an outlandish jargon, and therefore to be classed with Persians and Thracians as outside the pale of civilization. But they only needed access to the sea, from which they had been at first cut off by a coast-fringe of Greek settlements, to make a rapid rise in civilization; moreover, they had two qualifications for empire which no Greek state possessed — incontestable superiority in strength and stable political institutions.

If the Greeks could have purged themselves of their paltry conceit and dropped their petty conception of nationality, they might have settled down into a confederacy under the leadership of Macedon, perhaps have escaped the more alien domination of Rome later, and thereby have changed the entire course of European history.

Alexander, both by arms and policy, brought for the first time the East and the West into close contact. He acted on the only principle by which races can be moulded together, and in the perception of harmony in diversity he showed that he had not sat at the feet of Aristotle in vain. Unlike other Asiatic conquerors, his progress was marked by much more than devastation and ruin; at every step of his course the Greek language and civilization took root and flourished.

His empire, it is true, was broken up. It was divided by his generals into several kingdoms, the chief of which, Macedon, Syria,

married Caius Marius, the celebrated Roman consul.

At an early age Cæsar entered upon the active duties of a Roman citizen. The two circumstances which are said to have brought him early into sympathy with the Roman democracy, and against a republican oligarchy, were, first, the marriage of his aunt to Marius, and, second, his own marriage — when but seventeen — to Cornelia, daughter of Lucius Cinna, leader of the people.

This connection exposed him to the greatest danger. His father-in-law was the deadly enemy of Sulla, and the latter wreaked on the head of Cæsar the vengeance which circumstances prevented him from inflicting upon the heads of the opposing faction. When ordered to put away his wife, Cæsar refused to obey. His wife's fortune was confiscated, he was deprived of the office of priest in the temple of Jupiter Flamens, and escaped death only through what Sulla deemed the weak intercession of his enemies. That relentless despot saw and foretold the greatness which was destined to overshadow many nations, and one day to become fatal to its possessor.

The overthrow of the aristocratic party seems from the first to have been the settled purpose of Cæsar. He saw that no permanent government was possible while the rule of Rome was in the hands of alternate factions, whose equal atrocities more than compensated for the absence of the foreign invader. The existing virtue was in all cases sought to be corrupted or destroyed; the genius of youth was either won over to the advocacy of party, or ruthlessly trodden out of sight. Patriotism was unknown, purity of soul impossible, except in the instances of lowly men. If not beyond the province of human inquiry, it is yet beyond its reach to ascertain how far Cæsar was guided by loftier motives, and what portion of his conduct was owing to the baser impulses of selfish ambition.

The interference of Sulla was of much advantage to Cæsar, as it removed him from the sphere of action at a time when his exertions would have been fruitless, and gave him leisure for cultivating those powers of mind which he brought into effective play in subsequent years. With the exception of a single campaign against the king of Bithynia in 81 B. C. — in which he took part — Cæsar had no opportunity to distinguish himself in arms during the flower of his youth.

On his return to Rome on the death of Sulla, 78 B. C., he found the popular party in a state of great ferment, and anxious to regain what it had lost under the vigorous despotism of the aristocratic dictator. Cæsar, however, took no part in the attempts of Lepidus to overthrow the oligarchy; but he showed his political leanings by prosecuting, in 77 B. C., Cornelius Dolabella — son-in-law of Cicero, and a great partisan of Sulla — for extortion in his province of Macedonia. To improve his eloquence, he went to Rhodes to study under the rhetorician, Apollonius Molo.

In 74 B. C. Cæsar returned to Rome, where he had been elected pontifex, and for the first time threw himself earnestly into public life. In the year 70 B. C. he first attached himself to Pompey, whose political actions at this time were of a decidedly democratic character. In 68 B. C. he obtained a quæstorship in Spain, and during the same year his wife Cornelia died. On his return to Rome in 67 B. C. he married Pompeia, a relative of Pompey, with whom he was daily becoming more intimate. In 65 B. C. he entered upon the office of curile ædile, and lavished vast sums of money on games and public buildings, by which he increased his already great popularity. For the next few years Cæsar is found steadily skirmishing on the popular side. In 63 B. C. he was elected pontifex maximus, and shortly after, prætor. During the same year occurred the famous debate on the Catiline conspiracy, in which the aristocratic party vainly endeavored to persuade the consul, Cicero, to include Cæsar in the list of conspirators. In 62 B. C. Pompey returned from the East, and disbanded his army. Next year Cæsar obtained the province of Hispania Ulterior.

His career in Spain was brilliant and decisive, and on his return he was elected consul, along with M. Calpurnius Bibulus. Shortly before the passing of the agrarian law — in 59 B. C.— Cæsar, with rare tact and sagacity, had reconciled the two most powerful men in Rome, Pompey and Crassus, who were then at variance, and had formed an alliance with them, known in history as the first triumvirate, 60 B. C. Both of these distinguished men aided him in carrying his agrarian law; and to strengthen still further the union which had been formed, he gave Pompey his daughter Julia in marriage, though she had been promised to Marcus Brutus, while he himself married Calpurnia, daughter of L. Piso, his successor in the consulship.

On the expiration of his term of office Cæsar then obtained for himself, by the popular vote, the province of Gallia Cisalpina and Illyricum for five years, to which the senate added — to prevent the popular assembly from doing so — the province of Gallia Transalpina. Nothing could have been more favorable for Cæsar's aims. He had now an opportunity of developing his extraordinary military genius, and of gathering round him an army of veterans, whom perpetual victory should inspire with thorough soldierly fidelity and devotion to his person. This was the very thing he wanted to give him a reputation equal to that of his coadjutors, Pompey and Crassus, whom, in genius, he far surpassed. Leaving, therefore, the political factions at Rome to exhaust themselves in petty strifes, in 58 B. C., after the banishment of Cicero, he repaired to his provinces, and during the next nine years conducted those splendid campaigns in Gaul, by which, had he done nothing else, he would have "built himself an everlasting name."

Cæsar's first campaign was against the Helvetii, whom he totally defeated near Bibracte. Out of three hundred sixty-eight thousand only one hundred ten thousand remained. These were commanded by Cæsar to return home and cultivate their lands. The eyes of the Gauls were now turned upon the new conqueror. His help was solicited, and this involved Cæsar in a second war with a German prince, named Ariovistus, who was utterly overthrown. Having in the course of one campaign successfully concluded two important wars, he led his troops into winter quarters.

Next year — 57 B. C.— occurred the Belgic war, in which Cæsar successively routed the Suessiones, Bellovaci, Ambiani, and Nervii, who, alarmed at the progress of the Roman arms, had entered into an alliance with each other against the invaders. When the senate received Cæsar's official despatches, it decreed a thanksgiving of fifteen days — an honor never previously granted to any other general. During the winter and the spring following, Cæsar stayed at Lucca; and, after spending large sums of money in hospitality, and in other less praiseworthy purposes, he departed for Gaul, where the flames of war had burst out in the northwest. The Veneti, a maritime people of Brittany, were the chief instigators of the insurrection. Cæsar's plans were laid with consummate skill, and were crowned with the most splendid success. The Veneti were totally defeated, and most of the other Gallic tribes were either checked or subdued. Cæsar wintered in the country of the Aulerci and Lexovii (Normandy), having, in the course of three campaigns, conquered the whole of Gaul.

In the year 55 B. C. Crassus went to Syria, and Pompey to Spain, while Cæsar's provincial government was prolonged for five years. He now undertook a fourth campaign against two German tribes which were about to enter Gaul. He was again successful; and, pursuing the fleeing enemy across the Rhine, spent eighteen days in plundering the district. He next invaded Britain, about the autumn; but, after a brief stay in the island, returned to Gaul. The Roman senate, astonished at his hardihood and his successes in regions where no Roman army had ever been before, accorded him a public thanksgiving of twenty days. In 54 B. C. Cæsar opened his fifth campaign by a second invasion of Britain. On his return to Gaul, he was compelled — on account of the scarcity of corn, arising from drought — to winter his army in divisions. This naturally aroused the hopes of the Gauls, who thought the time had come for recovering their independence. An insurrection broke out in the northeast of Gaul, which was at first partially successful, but was ultimately crushed. Cæsar resolved to winter at Samarobriva (Amiens), in the vicinity of the malcontents.

In 53 B. C. Cæsar commenced his sixth campaign. It was chiefly occupied in crushing a second insurrection of the Gauls. He now returned to northern Italy, that he might be able to communicate more easily and securely with his friends at Rome. That city was gradually becoming more anarchic, the evils of weak government more apparent; the hour for decisive action seemed to be approaching, and doubtless Cæsar's heart beat with expectation of the mighty future, when all at once the plot that fate was weaving in his favor appeared to be completely marred by a tremendous rebellion over the whole of Gaul, headed by a young warrior named Vercingetorix.

It was in the dead of winter when the news came to Cæsar, who instantly saw that at all hazards he must preserve his fame and his army. Leaving Pompey to succeed at Rome, he hurried, therefore, to meet the insurgent hordes. His great difficulty was to collect his scattered legions. First crossing, with some Cisalpine and provincial troops, the mountains of Auvergne, though they lay six feet in snow, he suddenly appeared among the Arverni, who, terrified at his unexpected approach, sent for their chief, Vercingetorix, to come to their assistance. This was what Cæsar wished. After some wonderful exhibitions of military skill, and numerous successes, Vercingetorix was shut up in Alesia (Alise in Burgundy) with all his infantry. Cæsar besieged him, and, though harassed by nearly three hundred thousand Gauls without, who attempted, but in vain, to break through the well-defended Roman lines, forced Vercingetorix to capitulate. Many of the tribes now hastened to submit to Cæsar, who prudently determined to winter among the vanquished. The senate voted him another public thanksgiving.

In the year 51 B. C. Cæsar proceeded to quell the tribes who still held out. This he successfully accomplished, and, having in addition reduced the whole of Aquitania, passed the winter of his eighth campaign in Belgium, where he spent the time both in a magnanimous and politic manner. The Gallic princes were courteously and generously treated; the common people were spared the imposition of further taxes, and everything was done to render it possible for him to visit Italy with safety in the spring. On his return he took up his residence at Ravenna, where he was informed of everything that was going on by the tribune, C. Curio. There can be no doubt that at this moment he was the most popular man in the state, while his soldiery were devoted to him with a loyalty as enthusiastic as that which Bonaparte inspired when fresh from his Italian victories.

Meanwhile, Pompey, whose vanity could not endure the greatness of Cæsar, had been gradually veering round again to the aristocracy, whose dread of the new conqueror was hourly increasing. After much futile diplomatic finessing on all sides, the senate carried a motion that Cæsar disband his army by a certain day, and that if he did not do so, he should be regarded as an enemy of the state. The tribunes, Mark Antony and Q. Cassius, put their veto on this motion; but they were violently driven out of the senate chamber, and, fearing for their lives, they fled to Cæsar's camp.

The senate, in the madness of their terror, now declared war, and intrusted the conduct of it to Pompey, whose pride in the invincibility of his military prowess hindered him from taking the necessary measures for the defense of the state. He fancied that his name would bring thousands to his standard, and he was even led to believe that Cæsar's troops were willing to desert their general. The result of this delusion was, that when hostilities formally commenced, Pompey had hardly any soldiers except two legions, which had recently been in the service of his rival.

Cæsar, on the other hand, perceiving that the time for decisive action had at length come, harangued his victorious troops, who were willing to follow him anywhere, crossed the Rubicon (a small stream which separated his province from Italy proper), and moved swiftly, amid the acclamations of the people, toward Rome. Pompey fled to Brundisium, pursued by Cæsar, but contrived to reach Greece in safety, March 17, 49 B. C. The Italian cities had everywhere gladly opened their gates to the conqueror as a deliverer. In three months Cæsar was master of all Italy.

Cæsar next subdued Pompey's legates in Spain, who were at the head of considerable forces. On his return he took Massilia, where he learned that he had been appointed dictator of the republic — an office which at this time he retained for only eleven days, but these were honorably distinguished by the passing of several humane enactments. Pompey, now thoroughly alive to the magnitude of his danger, had gathered a powerful army in Egypt, Greece, and the East, while his fleet swept the sea. Cæsar, however, crossing the Adriatic at an unexpected season, made a rush for Dyrrhachium, where he beseiged Pompey, who had intrenched his army on some high ground near the city. The first encounter was favorable to Pompey, who drove back Cæsar's legions with much loss. The latter now retreated to Thessaly, followed by his exulting enemies. A second battle ensued on the plains of Pharsalia on August 9, 48 B. C. Pompey's army was utterly routed, and he himself fled to Egypt, where he was murdered.

No sooner had the news reached Rome than Cæsar was again appointed dictator for a year, and consul for five years. He was invested with the power of a tribune for life, and with the right of holding all the magisterial assemblies except those for the election of the plebeian tribunes. He did not, however, return to Rome after the battle of Pharsalia, but went to Egypt, then in a distracted condition on account of the disputes regarding the succession. Here, out of love for Cleopatra, he entered upon the Alexandrine war, in which he was successful, and which he brought to a close in March, 47 B. C. Subsequently he overthrew a son of Mithridates, near Zela, in Pontus, August 2d of the same year, and arrived in Rome in September.

He was once more appointed dictator, and the property of Pompey was confiscated and sold. Before the close of the year he had set out for Africa, where his campaign against the Pompeian generals, Scipio and Cato, was crowned with victory at the battle of Thapsus, on April 6, 46 B. C. Cato committed suicide at Utica. With such irresistible celerity was the work of subjugation carried on that by the end of the summer Cæsar was again in Rome. He was not a man that could stoop to the vulgar atrocities of Marius or Sulla, so he majestically declared that henceforth he had no enemies, and that he would make no difference between Pompeians and Cæsarians. His victories in Gaul, Egypt, Pontus, and Africa were celebrated by four great triumphs, during which the whole Roman populace was feasted and fêted by the magnificent liberality of the dictator.

He had now demolished the government of the nobles, and he proceeded to check by wholesome enactments, as far as in him lay, the social evils which had long flourished in the city. During the year 46 B. C., also, he conferred a benefit on Rome and on the world by the reformation of the calendar, which had been greatly abused by the pontifical college for political purposes. After quelling an insurrection which now broke out in Spain, where Pompey's sons, Cneius and Sextus, had collected an army, he received the title of "father of his country," and also of *imperator*, was made dictator and *præfectus morum* for life, and consul for ten years; his person was declared sacred, and even divine; he obtained a bodyguard of knights and senators; his statue was placed in the temples; his portrait was struck on coins; the month Quintilis was called Julius in his honor; and on all public occasions he was permitted to wear the triumphal robe. At the festival of Lupercalia, Mark Antony, his devoted adherent, even publicly offered him a regal crown, but Cæsar, noting that the name of king was odious to the multitude, refused it.

Cæsar now proposed to make a digest of the whole Roman law for public use, to found libraries for the same purpose, to drain the Pontine marshes, to enlarge the harbor of Ostia, to dig a canal through the isthmus of Corinth, and to quell the inroads of the barbarians on the eastern frontiers; but in the midst of these vast designs he was cut off by assassination on the Ides (15th) of March, 44 B. C.

The details of the crime — the greatest disaster that could have befallen the Roman world, as subsequent events showed — are too familiar to require narration. It is sufficient to say that, of the sixty aristocrats who were in the conspiracy, many had partaken of Cæsar's generosity, and all of his clemency. A few, like Brutus, out of a weak and formal conscientiousness, based on theory rather than insight, were probably offended by Cæsar's desire to change the form of government into a hereditary monarchy; but the most, like Cassius, were inspired by a spleenful hatred of the dictator, and the base ambition of regaining power at all hazards.

Cæsar, who was about fifty-six years of age when he was murdered, was of noble and kingly presence, tall of stature, and possessed a countenance, which, though pale and thin with thought, was always animated by the light of his black eyes. He was bald-headed (at least in the latter part of his life), wore no beard, and, though of a rather delicate constitution naturally, he ultimately attained to the most vigorous health. His besetting sin was sensuality; but, without detracting from the criminality of his conduct in this respect, it may be said that it was as much the sin of the times in which he lived as his own, and that the superlative grandeur of his position gave a prominence to his irregularities which a more humble lot would have escaped.

The military fame of Cæsar, though the greatest of Roman generals, would hardly have procured for his memory the honors which have been awarded to it by posterity, had not the skill of the warrior been united in his person with the genius of the writer and the sagacity of the statesman. His intellect was marvelously versatile. He excelled in everything. He was not only the first general and statesman of his age, but he was — excepting Cicero — its greatest orator. As a historian, he has never been surpassed and collect his scattered legions. First crossing, with some Cisalpine and provincial troops, the mountains of Auvergne, though they lay six feet in snow, he suddenly appeared among the Arverni, who, terrified at his unexpected approach, sent for their chief, Vercingetorix, to come to their assistance. This was what Cæsar wished. After some wonderful exhibitions of military skill, and numerous successes, Vercingetorix was shut up in Alesia (Alise in Burgundy) with all his infantry. Cæsar besieged him, and, though harassed by nearly three hundred thousand Gauls without, who attempted, but in vain, to break through the well-defended Roman lines, forced Vercingetorix to capitulate. Many of the tribes now hastened to submit to Cæsar, who prudently determined to winter among the vanquished. The senate voted him another public thanksgiving.

In the year 51 B. C. Cæsar proceeded to quell the tribes who still held out. This he successfully accomplished, and, having in addition reduced the whole of Aquitania, passed the winter of his eighth campaign in Belgium, where he spent the time both in a magnanimous and politic manner. The Gallic princes were courteously and generously treated; the common people were spared the imposition of further taxes, and everything was done to render it possible for him to visit Italy with safety in the spring. On his return he took up his residence at Ravenna, where he was informed of everything that was going on by the tribune, C. Curio. There can be no doubt that at this moment he was the most popular man in the state, while his soldiery were devoted to him with a loyalty as enthusiastic as that which Bonaparte inspired when fresh from his Italian victories.

Meanwhile, Pompey, whose vanity could not endure the greatness of Cæsar, had been gradually veering round again to the aristocracy, whose dread of the new conqueror was hourly increasing. After much futile diplomatic finessing on all sides, the senate carried a motion that Cæsar disband his army by a certain day, and that if he did not do so, he should be regarded as an enemy of the state. The tribunes, Mark Antony and Q. Cassius, put their veto on this motion; but they were violently driven out of the senate chamber, and, fearing for their lives, they fled to Cæsar's camp.

The senate, in the madness of their terror, now declared war, and intrusted the conduct of it to Pompey, whose pride in the invincibility of his military prowess hindered him from taking the necessary measures for the defense of the state. He fancied that his name would bring thousands to his standard, and he was even led to believe that Cæsar's troops were willing to desert their general. The result of this delusion was, that when hostilities formally commenced, Pompey had hardly any soldiers except two legions, which had recently been in the service of his rival.

Cæsar, on the other hand, perceiving that the time for decisive action had at length come, harangued his victorious troops, who were willing to follow him anywhere, crossed the Rubicon (a small stream which separated his province from Italy proper), and moved swiftly, amid the acclamations of the people, toward Rome. Pompey fled to Brundisium, pursued by Cæsar, but contrived to reach Greece in safety, March 17, 49 B. C. The Italian cities had everywhere gladly opened their gates to the conqueror as a deliverer. In three months Cæsar was master of all Italy.

Cæsar next subdued Pompey's legates in Spain, who were at the head of considerable forces. On his return he took Massilia, where he learned that he had been appointed dictator of the republic — an office which at this time he retained for only eleven days, but these were honorably distinguished by the passing of several humane enactments. Pompey, now thoroughly alive to the magnitude of his danger, had gathered a powerful army in Egypt, Greece, and the East, while his fleet swept the sea. Cæsar, however, crossing the Adriatic at an unexpected season, made a rush for Dyrrhachium, where he besieged Pompey, who had intrenched his army on some high ground near the city. The first encounter was favorable to Pompey, who drove back Cæsar's legions with much loss. The latter now retreated to Thessaly, followed by his exulting enemies. A second battle ensued on the plains of Pharsalia on August 9, 48 B. C. Pompey's army was utterly routed, and he himself fled to Egypt, where he was murdered.

No sooner had the news reached Rome than Cæsar was again appointed dictator for a year, and consul for five years. He was invested with the power of a tribune for life, and with the right of holding all the magisterial assemblies except those for the election of the plebeian tribunes. He did not, however, return to Rome after the battle of Pharsalia, but went to Egypt, then in a distracted condition on account of the disputes regarding the succession. Here, out of love for Cleopatra, he entered upon the Alexandrine war, in which he was successful, and which he brought to a close in March, 47 B. C. Subsequently he overthrew a son of Mithridates, near Zela, in Pontus, August 2d of the same year, and arrived in Rome in September.

He was once more appointed dictator, and the property of Pompey was confiscated and sold. Before the close of the year he had set out for Africa, where his campaign against the Pompeian generals, Scipio and Cato, was crowned with victory at the battle of Thapsus, on April 6, 46 B. C. Cato committed suicide at Utica. With such irresistible celerity was the work of subjugation carried on that by the end of the summer Cæsar was again in Rome. He was not a man that could stoop to the vulgar atrocities of Marius or Sulla, so he majestically declared that henceforth he had no enemies, and that he would make no difference between Pompeians and Cæsarians. His victories in Gaul, Egypt, Pontus, and Africa were celebrated by four great triumphs, during which the whole Roman populace was feasted and fêted by the magnificent liberality of the dictator.

He had now demolished the government of the nobles, and he proceeded to check by wholesome enactments, as far as in him lay, the social evils which had long flourished in the city. During the year 46 B. C., also, he conferred a benefit on Rome and on the world by the reformation of the calendar, which had been greatly abused by the pontifical college for political purposes. After quelling an insurrection which now broke out in Spain, where Pompey's sons, Cneius and Sextus, had collected an army, he received the title of "father of his country," and also of *imperator*, was made dictator and *præfectus morum* for life, and consul for ten years; his person was declared sacred, and even divine; he obtained a bodyguard of knights and senators; his statue was placed in the temples; his portrait was struck on coins; the month Quintilis was called Julius in his honor; and on all public occasions he was permitted to wear the triumphal robe. At the festival of Lupercalia, Mark Antony, his devoted adherent, even publicly offered him a regal crown, but Cæsar, noting that the name of king was odious to the multitude, refused it.

Cæsar now proposed to make a digest of the whole Roman law for public use, to found libraries for the same purpose, to drain the Pontine marshes, to enlarge the harbor of Ostia, to dig a canal through the isthmus of Corinth, and to quell the inroads of the barbarians on the eastern frontiers; but in the midst of these vast designs he was cut off by assassination on the Ides (15th) of March, 44 B. C.

The details of the crime — the greatest disaster that could have befallen the Roman world, as subsequent events showed — are too familiar to require narration. It is sufficient to say that, of the sixty aristocrats who were in the conspiracy, many had partaken of Cæsar's generosity, and all of his clemency. A few, like Brutus, out of a weak and formal conscientiousness, based on theory rather than insight, were probably offended by Cæsar's desire to change the form of government into a hereditary monarchy; but the most, like Cassius, were inspired by a spleenful hatred of the dictator, and the base ambition of regaining power at all hazards.

Cæsar, who was about fifty-six years of age when he was murdered, was of noble and kingly presence, tall of stature, and possessed a countenance, which, though pale and thin with thought, was always animated by the light of his black eyes. He was bald-headed (at least in the latter part of his life), wore no beard, and, though of a rather delicate constitution naturally, he ultimately attained to the most vigorous health. His besetting sin was sensuality; but, without detracting from the criminality of his conduct in this respect, it may be said that it was as much the sin of the times in which he lived as his own, and that the superlative grandeur of his position gave a prominence to his irregularities which a more humble lot would have escaped.

The military fame of Cæsar, though the greatest of Roman generals, would hardly have procured for his memory the honors which have been awarded to it by posterity, had not the skill of the warrior been united in his person with the genius of the writer and the sagacity of the statesman. His intellect was marvelously versatile. He excelled in everything. He was not only the first general and statesman of his age, but he was — excepting Cicero — its greatest orator. As a historian, he has never been surpassed and rarely equaled in simplicity and vigor of style, and in the truthfulness with which he narrates events of which he was an eyewitness. He was, in addition, a mathematician, philologist, jurist, and architect, and always took great pleasure in literary society. Most of his writings have been lost, though their titles are preserved; but we still possess his invaluable "Commentaries," with which almost every schoolboy and schoolgirl is familiar.

Though he did not live to accomplish his great work, the stamp which his commanding genius left upon it never was obliterated as long as Roman Cæsars wore the imperial purple; and even now a breath of his spirit pervades the world, and a faint echo of his name. Rome in him produced her greatest man. Intellect and will were justly balanced in his great soul. No illusion, no enthusiasm, no ideals clouded his perception or perverted his judgment. A cool, calm, reflecting, prosaic Roman, he saw things as they were, not as he wished them to be. He accepted the facts of his position, and shaped his course of action accordingly. He judged men and institutions for what they were worth, and, by the irresistible force of his will, pressed them into his service. He never wavered or hesitated in his whole life, and never lost sight of his final aim. What he had undertaken he carried out — not with the obstinacy of a narrow and stubborn mind, but without passion, with caution and courage combined. In war he was bold and daring, relying more upon rapidity of movement than upon numbers, and trusting much also to that good fortune which always favors the brave. He relied not upon rules and established usage, but upon the intuition of genius. He had no system, and no school; but, as if by inspiration, he always adopted the means which led to success.

Such was the great Roman Cæsar, by nature fitted to accomplish a work which, in the development of human affairs, had become imperative. "Within the short space of fourteen years," says Müller, "he subdued Gaul, thickly inhabited by warlike nations; twice conquered Spain; entered Germany and Britain; marched through Italy at the head of a victorious army; destroyed the power of Pompey the Great; reduced Egypt to obedience; saw and defeated Pharnaces; overpowered, in Africa, the great name of Cato and the arms of Juba; fought fifty battles, in which 1,192,000 men fell; was the greatest orator in the world, next to Cicero; set a pattern to all historians, which has never been excelled; wrote learnedly on the sciences of grammar and augury; and, falling by a premature death, left memorials of his great plans for the extension of the empire and the legislation of the world."

He perceived his duty, he undertook and accomplished it; and if anything is wanted to engage our sympathies, not less than our admiration, for the greatest son of Rome, it is that he died a victim on her altar.

CHARLEMAGNE

A. D.		AGE
742	Born, probably at Aix-la-Chapelle, or Ingelheim, Germany, ...	..
768	Joint ruler of the Franks with Carloman,	26
771	Sole king, ...	29
772	Made war on the Saxons, ...	30
774	Visited Rome, ...	32
778	Subdued northern Spain, ...	36
780	Defeated Saxons under Wittekind, . .	38
788	Conquered Bavaria, ...	46
800	Crowned emperor of the West by Leo III., ...	58
814	Died at Aix-la-Chapelle, ...	72

CHARLES THE GREAT, now almost universally called by the French name Charlemagne, king of the Franks, and Roman emperor, was the greatest conqueror and ruler of his age. He was born in the year 742, but the place of his birth is in dispute. Salzburg, in modern Austria, Aix-la-Chapelle, in Belgium, and Ingelheim, near Mainz, Germany, have all claimed the honor of his birth. The best evidence favors one of the two latter.

He was the son of Pepin the Short, first Carolingian king of the Franks, and grandson of Charles Martel, the hero whose victory near Tours in 732 saved Europe from subjugation by the Saracens. On the death of Pepin in 768, his dominions were divided between his sons, Charles and Carloman, the former taking Austrasia and Neustria. The duchy of Aquitaine which he had recently conquered he divided between them.

In 770 Charles married the daughter of

Desiderius, king of the Lombards, but repudiated her in the following year, and married Hildegarde, a German princess. At the close of 771, by the death of Carloman, Charles became sole king of the Franks, his kingdom, Francia, extending from the English channel to the Mediterranean. Hence it is that he has been styled Charles I. in the enumeration both of the French kings, and of the German or Roman emperors.

In 772 he made war on the Saxons; and this was the beginning of a conflict which was not really ended until more than thirty years hence. Under the name of Saxons were included the non-Christian German tribes which inhabited the country between the Rhine and the Elbe in modern Westphalia, Hanover, Brunswick, Oldenburg, Holstein, Mecklenburg, and north Saxony. These tribes, more or less allied with the Northmen, remained attached to the old religion of Odin; they maintained a strictly tribal system in scattered centers of ill-defined extent: they were still in the partly nomadic stage, and without any regular political organization.

A race of hardy soldiers, in so backward and inorganic a state, formed a standing menace to the settled Christian populations of the Frankish dominion, very much as did the Teutonic and Gothic tribes to the Roman empire. The absence of central authority and of town life made any effective conquest of them very tedious, and even a permanent peace impossible. The one means of their real incorporation with western Europe was their adoption of the civilization and religion of the Franks. The security of the Frankish dominions rested on the incorporation of their barbarian kinsmen on their northeastern frontier.

It is highly characteristic of the genius of the young king of the Franks that he at once recognized this, and from the first set himself to a terrible task, where neither wealth nor glory could be won. Charles's Saxon wars, the first and most continuous effort of his reign, like the wars waged by every civilized conqueror against a race of brave and stubborn nomads, were neither marked by great victories nor by very definite campaigns. In the long course of them he tried every policy in turn: severity, conciliation, exhortation, and negotiation. From time to time his measures are marked by dreadful bloodshed and destruction; and, throughout, his warfare has much of the character and not a little of the ferocity of a war of religion.

In the spring of 772 Charles crossed the Rhine at Worms and opened the campaign in Westphalia. He destroyed, at Eresburg, the stronghold of the Saxons, and the war was prolonged in a succession of risings and desultory victories. Immediately at the close of his first Saxon campaign, Charles turned his arms against Lombardy in 773. Crossing the Alps in two columns, one by the Valais, and one through Savoy, in two brief and brilliant campaigns he completely subdued northern Italy as far as the Neapolitan duchy, and was acknowledged as king of Lombardy in 774. The pope, welcoming the Frankish king as the deliverer of the church from the hated Lombard, received Charles at Rome, Easter, 774, conferred on him the title of "patrician of Rome," and entered into a close alliance.

It was then Charles endowed the church with immense possessions — the modern states of the church; and this conquest of northern Italy was the commencement of the long dependence of Italy on the empire. It was really only a political conquest of the country, not a displacement or spoliation of the native Lombards. Charles, in this decisive and characteristic conquest, was but following the policy of Pepin and Charles Martel, and was laying the foundation of the Frankish king as the friend and protector of the church.

Charles's next expedition was into Spain, whither he was called by the offer of an alliance with a Saracen emir, who revolted from the caliph of Cordova, in 778. Though his campaign was without brilliant results, he advanced to the Ebro and effected a satisfactory peace. It was on the return of his army through the valley of Roncesvalles, near Pamplona, that the Gascons fell upon his rear guard, and killed Roland and many of his peers. The defeat, which afflicted the king more than it weakened him, was the basis of the poetic legend known in the middle ages as the "Ballad of Roland." From 778 to 812 the Franks made six other expeditions into Spain, the main result of which was finally to deliver France from any further fear of Saracen invasion, and to establish as a bulwark two small border counties — the marches of Gascony and of Spain on the south of the Pyrenees.

Further conquests awaited the king on the east. The incessant wars with the Saxons compelled Charles to follow the turbulent races lying east and south of them. These wars are said to have cost Charles more than twenty armies. Time after time the Saxons, compelled to accept baptism and to submit to the king, broke out into rebellion and renounced Christianity. Their national leader and hero was Wittekind, who was severely defeated in 780. In the campaign of 782 Charles massacred in cold blood forty-five hundred Saxon prisoners; and, by an order in 784, he made baptism compulsory under pain of death. He crossed the Elbe in 788, and advanced to the Oder. There he established a tributary district extending to the Eider, the border of Denmark. Southward he carried his arms into Bohemia, Bavaria, and Hungary, as far as the Theiss, and in a series of campaigns subdued the main part of the modern empire of Austria.

Thirty years of almost incessant war and conquest under Charlemagne had vastly extended the kingdom of Pepin, and had converted the Frankish dominion into an empire that comprised the main part of western Europe. Taking it in its greatest limits, it extended from the bay of Biscay to the river Theiss, and thence to the Adriatic on the south, and the mouth of the Oder on the Baltic; and from the northern sea across all Italy, down to the duchy of Benevento. It thus comprised the whole of France; Germany and Austria, except East Prussia, eastern Hungary, and Croatia; the northwest corner of Spain; and all Italy, except the kingdom of Naples.

The great position of Charles now called for formal consecration. Acknowledged as the greatest ruler since the Roman emperors, manifestly the superior in power of the Greek emperor at Byzantium, supported by the entire influence of the church, he resolved to revive in western Europe the conception of the empire under Catholic forms.

On Christmas day, 800, the king in great state attended mass in St. Peter's at Rome, where Pope Leo III., placing an imperial crown on his head, thrice hailed him as "Augustus, crowned by God, great and pacific emperor of the Romans." The pope, anointing his head with the sacred oil, prostrated himself at the feet of the emperor, and the entire assembly of priests, soldiers, and people ratified the act with their acclamations. Thus began the revived Roman empire of the West, and with it the formation of the common life of western Europe. The barbarian or mediæval world was formally linked to the Roman. The church, and the papacy as its organ, became the spiritual guide of the empire, and the Frankish sovereign became the right hand of the church.

Great as a warrior, Charles was even greater as administrator and civil ruler. The whole empire was divided into counties, the count residing in each being charged with authority, civil, judicial, and military. Under each count was a vicar, or, as he was finally called, a viscount, who held three courts yearly, the more serious causes being reserved for the count's court. The imperial authority was specially exercised by the *missi dominici*, or royal delegates, who heard appeals, reported to the emperor, and generally maintained the unity of the empire. In spring and autumn two great assemblies were held for ratifying the legislation proposed by the emperor. These assemblies consisted entirely of the principal officials, lay or clerical, and they usually sat in two distinct bodies, one spiritual, the other temporal. We still possess upward of eleven hundred articles, in sixty-five capitularies, or codes, and some forty other rescripts, regulating in the minutest detail the whole political and economical system of the empire. Especially noteworthy is the capitulary of the year 787, which provided for a higher standard of education, and is called by Ampère "the charter of modern thought."

The emperor now still more largely endowed the church, insisting on the payment of tithes in full; he also founded numerous churches, schools, monasteries, and bishoprics. He was passionately devoted to the revival of learning, of music, and the other arts, and built sumptuous palaces, particularly at Aix-la-Chapelle and Ingelheim — for he had no fixed capital. He gathered round him learned men from every country, the chief of whom were the Saxon, Alcuin, the Lombard, Paul the Deacon, Peter of Pisa, and Clement of Ireland, and above all his secretary, Einhard, or Eginhard, who has left us an admirable life of his chief. With the aid of these men, the best intellects of their age, inspired by the intense zeal of the emperor for all forms of culture, a real but short renascence of learning took place in the Frankish kingdom. Architecture, music, grammar, the languages of Greece and Rome, their literature and art, the art of illumination, even science, received a new impulse. From this reign we find the church an independent, vast, and coördinate authority in government.

Systematic education, eleemosynary institutions, regular taxation, and periodical assizes begin to be a part of the ordinary civilization of Europe.

Charlemagne's scheme for the union of the newly revived western empire with the empire of the East, by his marriage with Irene, the Byzantine empress, failed by reason of Irene's overthrow. After this he still extended and confirmed his conquests both in Spain and in Germany. He labored to bring the Saxons to a general reception of Christianity, and founded bishoprics for this purpose. To the end of his reign he was incessantly engaged in wars, and insurrections were always apt to break out in the frontier parts of his dominions, which he endeavored to secure, however, not only by military power and arrangements, but by continued improvements in political and social institutions. In this period of his active life he projected a canal to join the North sea and the Euxine. His power was felt in the English kingdoms. Just before Offa of Mercia extended his sway in all directions, Boniface had been preaching to the pagans in Germany, and English affairs began to interest the Franks. The policy of Charles led him to receive at his court the enemies of Offa, and among the refugees was Egbert, afterward king of the English. It seemed likely that war might break out between Offa and Charles, but this was happily averted by the influence of Alcuin, who still continued at the latter's court.

But the sun of Charlemagne went down among clouds. The wide empire which he had pieced together by the labor of a lifetime was threatened with ruin. Already he could point out the foes which would overthrow it. On one occasion he was sojourning on the southern coast of Gaul. Looking out one day upon the blue waters of the Mediterranean, he descried some long low galleys crawling along the line of the horizon, and wondered what they were. "These," said his attendants, "must be ships from the coast of Africa, Jewish merchantmen or British traders." "No!" replied he, "they are not the ships of commerce; I know by their lightness of movement. They are the galleys of the Norsemen; and though I know such miserable pirates can do me no harm, I cannot help weeping when I think of the miseries they will inflict on my descendants, and the lands they shall rule." And it was remarked that his eyes were filled with tears.

Another cause of grief to Charlemagne was the state of his family. He had divided his empire among his full-grown sons, and had trusted that they would keep what he had won. Death, however, cut off two of them; and it was one of the last acts of the broken-hearted father to install the sole survivor, Louis, as his successor. Placing the imperial crown upon the altar, he ordered Louis to take it with his own hands, that he might understand he wore it in his own right, under no authority but that of God. He then tendered these words of advice to his son and successor: "Love your people as your children," said he, "choose your magistrates and governors from those whose belief in God will preserve them from corruption, and see that your own life be blameless."

The emperor died on January 28, 814, after a reign of more than forty-five years. He was buried with great pomp at Aix-la-Chapelle in a sarcophagus which, it is believed, may still be seen there. His tomb and his remains were long the object of veneration and mystical legend. In 1000 the emperor Otho III. visited the tomb and opened the vault, as did Frederick Barbarossa again in 1166, when Charlemagne was duly canonized as a confessor.

His faithful secretary, Einhard, has left us a splendid picture of Charlemagne personally, which almost presents him as the ideal hero of mediæval legend. He was of great stature and noble mien, with immense strength, energy, and activity; a powerful orator, with a clear voice; simple in his habits, temperate, and frugal; affable, courteous, delighting in music, in conversation, and in books; he was just, patient, magnanimous, warm in his friendships, incapable of jealousy, and sincerely pious.

The one defect of his character, one that he shared with nearly all the chieftains of his race, was sexual lawlessness, and even a cynical indifference to the marriage contract. Five wives, of whom he repudiated two after a short cohabitation, numerous concubines, and eighteen children are mentioned. And he was careless of the profligacy of his daughters, whom he loved extravagantly, and kept at his side unmarried.

In nature, as in nearly all his great qualities, he singularly resembled Julius Cæsar, although what was supreme culture in the Roman was the passion for supreme culture in the Frank. The emperor himself studied astronomy, music and physics; he read Greek, and was an enthusiastic promoter of architecture, engineering, and the arts. He used by preference his mother tongue, German, Latin being only a written language. He made many efforts to learn to write, but never succeeded. At his court he had fixed hours for study, in which he took care to engage his courtiers by forming them into an academy. He was sober and abstemious in his food, and simple to an extreme in the matter of raiment. "For shame!" he exclaimed, to one who came before him attired more elegantly than the occasion demanded, "Dress yourself like a man; and if you would be distinguished, let it be by your merits, not by your garments."

Charlemagne was indefatigable in all the duties of government, and was not only by title, but in the most important sense, emperor of the West — the first Germanic king to create an empire on the ruins of Rome. His whole reign was a supreme effort to recast the world shattered by successive invasions of barbarians, and to unite it under one vast imperial organization.

The Romans had come into hostile contact with German tribes as far back as Cæsar's campaigns in Gaul in 55 B. C. In 9 A. D. the German hero, Arminius (Hermann), at the head of his confederate countrymen, had encountered the Roman commander, Varus, at the head of three legions, and in a three days' fight in a region of wooded hills defeated and destroyed the whole army. The centuries of imperial Rome were full of the din of conflict between the forces of the two peoples, the one declining, the other waxing mightier. Rome at length ceased to be a seat of empire, and for three centuries was subject to the emperors of the East. A new religion had superseded the old paganism, and on the seven hills was throned a new power, claiming to be its representative and chief. And now, at length, in the eighth century, under Charlemagne, the new empire of the West was reëstablished with a German king at its head.

At the time of his advent the Gallo-Frankish nation, vast and without cohesion, brutish and ignorant, was incapable of bringing forth with the aid of its own wisdom and virtue a stable government. Hosts of different forces, without enlightenment and without restraint, were everywhere and incessantly struggling for dominion, or were ever troubling and endangering the social condition. In the midst of this chaos of unruly forces and selfish passions, Charlemagne alone understood the essential needs of the age; and he seized and exercised the personal power almost of a despot, but a beneficent one. Such was the empire of Charlemagne.

Among annalists and historians, some, treating him as a mere conqueror and despot, have ignored his merits and his glory; others, admiring him without scruple, have made him a founder of free institutions — a constitutional monarch. Both are equally mistaken: Charlemagne was indeed both a conqueror and a despot; but by his conquests and personal power he saved Gallo-Frankish society from barbaric invasion without and anarchy within. The empire he created and organized by his genius, it is true, gradually fell to pieces after his death. His endeavor to resuscitate an old civilization, to engraft the Christian Roman culture on the vigorous stem of the Teutonic races, and to unite all the Germanic tribes in one empire, before the long action of historic influences had stamped upon them a distinct national character — this was to a great extent a failure, because one lifetime was too short for its accomplishment.

His greatness lies in the nobility of his aim, in the energy and wisdom with which he carried it out during his life, and also in the enduring traces of valuable work which remained notwithstanding the general wreck of his empire; for, though the central organization was swept away, the provincial authorities remained, to be transformed into the new feudal organization of western Europe, while the idea of the revival of the Christian Roman empire was to be taken up by other sections of the Germanic race. Though the circumstances of his time prevented him from being the founder of a new epoch in history, like Cæsar or Alexander, yet, in the greatness of his character, in his marvelous many-sided activity, and in the magic influence of his name on subsequent generations, he was equal to either.

It has been intimated that Charlemagne was personally almost the equal of Cæsar, and occupied an even superior position. The enormous advantage given to a man of supreme genius, who is placed by birth on a throne of undoubted legitimacy, enabled him to dispense with the struggles which cost Cæsar forty years of life. Of all the mighty chiefs who have formed the course of human civilization, Charlemagne yields only to Cæsar in greatness, and in moral elevation of nature is surpassed by Alfred the Great alone. The instinct of mankind for one thousand years has marked him out as the great hero of the modern world, and has indelibly stamped his supremacy on his very name.

No man that ever lived combined, in so high a degree, those qualities which rule men and direct events with those which endear the possessor and attach his contemporaries. No man was ever more trusted and loved by his people, more respected and feared by other kings, more esteemed in his lifetime, or more regretted at his death. And we end by saying with Gibbon: "The appellation of *great* has been often bestowed, and sometimes deserved; but Charlemagne is the only prince in whose favor the title has been indissolubly blended with the name. That name, with the addition of *saint*, is inserted in the Roman calendar; and the saint, by a rare felicity, is crowned with the praises of the historians and philosophers of an enlightened age. His *real* merit is doubtless enhanced by the barbarism of the nation and the times from which he emerged. The dignity of his person, the length of his reign, the prosperity of his arms, the vigor of his government, and the reverence of distant nations distinguish him from the royal crowd; and Europe dates a new era from his restoration of the western empire. That empire was not unworthy of its title; and some of the fairest kingdoms of Europe were the patrimony or conquest of a prince who reigned at the same time in France, Spain, Italy, Germany, and Hungary."

ALFRED THE GREAT

A. D.		AGE
849	Born at Wantage, England, . . .	. .
868	Assisted in repelling the Danes; married, ...	19
871	Succeeded to the crown, ...	22
875	Defeated Danes at sea, ...	26
878	Dispossessed of kingdom by Danes under Guthrum; restored to throne by peace of Wedmore, .	29
886	Sovereign of all England; began to rebuild London, ...	37
888	Began his Anglo-Saxon translations, ...	39
893–97	Wars against Northmen, under Hastings, ...	44–48
897	Final defeat of Danes, ...	48
901	Died, and buried at Winchester, .	52

ALFRED THE GREAT, the most illustrious of all the British rulers, was born in Wantage, Berkshire, England, in the year 849. He was the grandson of the great Egbert, who had before his death been recognized as over-lord of all the English kingdoms, and the fourth and youngest son of Ethelwulf by his wife Osburga, of the race of Cerdic.

Alfred was the favorite son, and in his fifth year was sent to Rome, and there presented as the future king to Pope Leo IV. Two years later he was again at Rome with his father and remained there a year. Egbert, Alfred's grandfather and predecessor, spent two years at the court of Charles. Alfred was brought up in part by his stepmother, Judith, daughter of Charles the Bald, grandson of Charlemagne. He was thus essentially Europeanized, with all the knowledge, culture, and traditions of the great Frank courts. In his twentieth year he married. Whatever may have been his father's intention, Alfred saw his three brothers successively crowned before himself; but on the death of Ethelred, last of the three, he was declared king in 871.

It was a rough and troublous time. The events of three centuries earlier were repeating themselves. The Northmen, now called the Danes, had for thirty or forty years been again making descents upon the English coasts, and renewing all the old horrors of piratical warfare.

Alfred had taken active part with Ethelred in the conflict in 868, and now his most pressing duty was to continue it. In the first year of his reign he fought nine battles with the Danes, apparently unvictorious; for he was obliged to make peace with them, and could not prevent their overrunning the rest of the country and making their winter quarters in London.

In 875 Alfred defeated the Danes at sea, and the next year had to again make peace with them at Wareham. They then took Exeter, and the Welsh joined them. The city was retaken by Alfred in 877; but soon afterward the invaders, under Guthrum, completely overran the whole kingdom of the West Saxons.

Alfred, no longer able to collect an effective army, was obliged to seek security in the hills and forests, and for some time found refuge in a cowherd's hut. He still, however, kept up some communication with his friends, and as soon as the people began once more to arm against the Danes, he built a stronghold on an elevation or island — still known as Athelney, the "island of the nobles," or the "royal island"— amid the marshes of Somersetshire, to which he summoned his faithful followers. From this fortress he made frequent successful sallies against the enemy, and after a comparatively short time he found himself at the head of a considerable army, with which he totally routed them in a great victory at Ethandun, near Edington, in Wiltshire. After holding out for some time in a stronghold to which they had retreated, the invaders capitulated. By the peace of Wedmore in 878, Alfred accepted hostages and their solemn oath to quit his territory of Wessex, and receive baptism. Their king, Guthrum, was baptized with thirty of his followers, and ever after proved faithful in his allegiance to Alfred.

After this decisive victory the power of Alfred steadily increased, both by land and sea — for already he had built England's first fleet — he beat the Danes in numerous battles, and gradually their possessions were confined to the northern and eastern coasts. In 886 Alfred, without any formal installation, became recognized as the sovereign of all England, a title to which he had proved his right by the most indisputable arguments. During the ensuing years of peace he rebuilt the cities that had suffered most during the war, particularly London; erected new fortresses, and trained the people to the use of arms; at the same time he encouraged husbandry and other useful arts, and founded those wise laws and institutions which contributed so much to the future greatness and welfare of England.

He saw, also, as Charlemagne saw, that the sole guarantee for the incorporation of the Northmen with European civilization was their conversion to Christianity. The whole kingdom was divided into military districts, each bound to supply its warriors to defend the country. He then began to create a navy; and he is thus the founder of the English maritime power. Having secured the kingdom within and without, Alfred applied himself to the strict enforcement of justice, and to the formation of a sort of common law, founded on the laws of Ina and Offa, the ten commandments and some other parts of the laws of Moses being added to it. The administration of justice was reformed, and as far as possible the "wild injustice of revenge" was suppressed.

Alfred had the insight into character which guided him well in selecting the right men to assist him. All his desires and all his energies were concentrated on his task of promoting the welfare of his people. William of Malmesbury, with enthusiastic exaggeration, declared that "a purse of money, or a pair of golden bracelets," might in Alfred's day be exposed for weeks in complete safety on the common highways. Alfred is also said — though erroneously, as is now believed — to have been the author of "trial by jury."

But the most distinguishing feature in Alfred's career was his zeal for learning — a zeal which quite equaled that of Charlemagne. Alfred, however, surpassed Charlemagne in literary accomplishments. At the age of twelve, we are told, the Saxon prince learned to read, and through life carried a book in his bosom for daily study. He delighted in the old Saxon poems, which he caused to be collected and recited. He established and directed a school for young nobles; had other schools founded, and summoned scholarly men from France — among them the learned Grimbald from St. Omer — to teach in them. He founded abbeys, and strove to effect the education of his people.

But he was not merely a promoter of learning; he was himself a scholar and a teacher. About 888 he began the translation and adaptation of four most important works in Latin — the "Compilation of Orosius," the one accessible book of universal history, the "History" of Bede, the "Consolation" of Boethius, and the "Pastoral" of Pope Gregory. With these translations by Alfred the Great, English prose literature begins. And with the *English Chronicle*, which took its final shape in his reign, possibly under his hand to some extent, English history begins. The *Chronicle*, says John Richard Green, is "the first vernacular history of any Teutonic people, the earliest and most venerable monument of Teutonic prose." Alfred is thus at once the creator of English prose literature, as he is the founder of England as a nation — of its laws, its government, its navy, and its national consciousness.

Alfred, however, had more fighting to do yet. In 893 a large body of Danes under Hastings landed in Kent, and fresh struggles tasked his energies for several years. They were defeated by Alfred at Farnham; by Ethelred at Bemfleet; were besieged in Chester, and driven away; and, in 897, they broke up their army and the war was virtually ended. The war was accompanied and followed by a pestilence which caused a great mortality, disheartening the people more than the war had done.

During his whole reign Alfred exhibited an intense and many-sided activity; he practically put himself at the head of the whole active life of his people — military, civil, judicial, industrial, artistic, intellectual, and religious. He sent a ship on a voyage of discovery to the North sea, and despatched missions to Jerusalem and to Rome. He made Winchester what Charlemagne made Aix-la-Chapelle—the center of intelligence, art, and culture for these northern islands. He encouraged foreign traders, and introduced continental artificers and artists.

After a busy reign of thirty years he died October 28, 901, in his fifty-second year, and was buried in the Old Minster of Winchester; thence his body was removed to the New Minster, and afterward to Hyde abbey, long since destroyed. No man now can point to the burying place of the noblest of Englishmen. His eldest surviving son, Edward, succeeded him.

In 1693 a beautiful specimen of gold enameled work, bearing the inscription, "Alfred had me made," was found near the place of his retreat at Athelney. It is known as "Alfred's jewel," and is kept in the Ashmolean museum at Oxford.

On September 18, 1901, the thousandth anniversary of Alfred was celebrated at Winchester, the capital of his Anglo-Saxon kingdom. Numerous distinguished men from the English-speaking countries of the world participated in the commemorative exercises. On the 20th of the same month a colossal statue of this noble king — the work of Thornycroft — was unveiled, and a memorial oration delivered by Lord Rosebery. About the same time various exercises were held, also, throughout our own country and Canada in celebration of the millenary of "the founder of the Anglo-Saxon race."

The career of Alfred was, in many respects, very similar to that of Charlemagne. He reproduced his work exactly on a smaller scale, but in even more perfect form. The field of his wars and his government was, indeed, small. But his conduct in peace as in war displays the true eye of genius and the heroism of the born creator of nations. "So long as I have lived," wrote Alfred himself, "I have striven to live worthily, in hopes to leave to the men that come after a remembrance of me in good works." It is, therefore, not surprising that the great services of Alfred in peace and in war should have led posterity to ascribe every English institution, of which the beginning was obscure, to his contrivance.

"Alfred's life," says a distinguished historian, "was one long battle-day, his kingdom was one wide battle-field, and his subjects were half-tamed barbarians. In the midst of all these untoward circumstances, he had grown up a civilized king and a Christian. It seemed as if the light of heaven had left the rest of the world in darkness, and had fallen upon him alone. Whenever there came a lull in the midst of his lifelong warfare, he strove to enlighten his benighted country. He established schools; he brought over learned men from the continent to be the teachers; and he insisted that the noblemen's sons should attend as pupils. And meanwhile he himself became an earnest student. We can imagine him in a room of a rough wooden fort, poring over his books and papers. Within reach of his hand lie his weapons and armor. That he may be able to note the time, a tall candle marked off into inches burns before him. That the candle may not be wasted by the draughts which come blowing through the seams of the wooden walls, it is protected by a lantern. In course of time two or three churchmen with shaven crowns are ushered in; and they help him to construe the meaning of some useful Latin author, and to write it down in Saxon for the benefit of his people."

He is perhaps the only man of action recorded in history of whom no defect of character and no crime is known. All the anecdotes represent him as a perfect hero, of dauntless courage, of romantic magnanimity, of intense piety, and entire simplicity; with exquisite geniality, grace, and unfailing sweetness. He almost equals Cæsar, Charlemagne, and Frederick in genius for war and for organization, and far surpasses them all in purity and moral beauty. In foresight, tenacity, and practical sagacity, he is the peer of Richelieu, Cromwell, and William the Silent, while he stands alone in saintly simplicity, serenity, and perfection of every moral grace and charm. He was a saint without superstition, imbecility, or fanaticism; a sagacious ruler who never sacrificed a principle; an enthusiastic student who never ceased to be a king.

What Aristides was to the Greeks, St. Louis to the French, Washington to the Americans, that Alfred was to the English: their saint, their demigod, their perfect model of virtue.

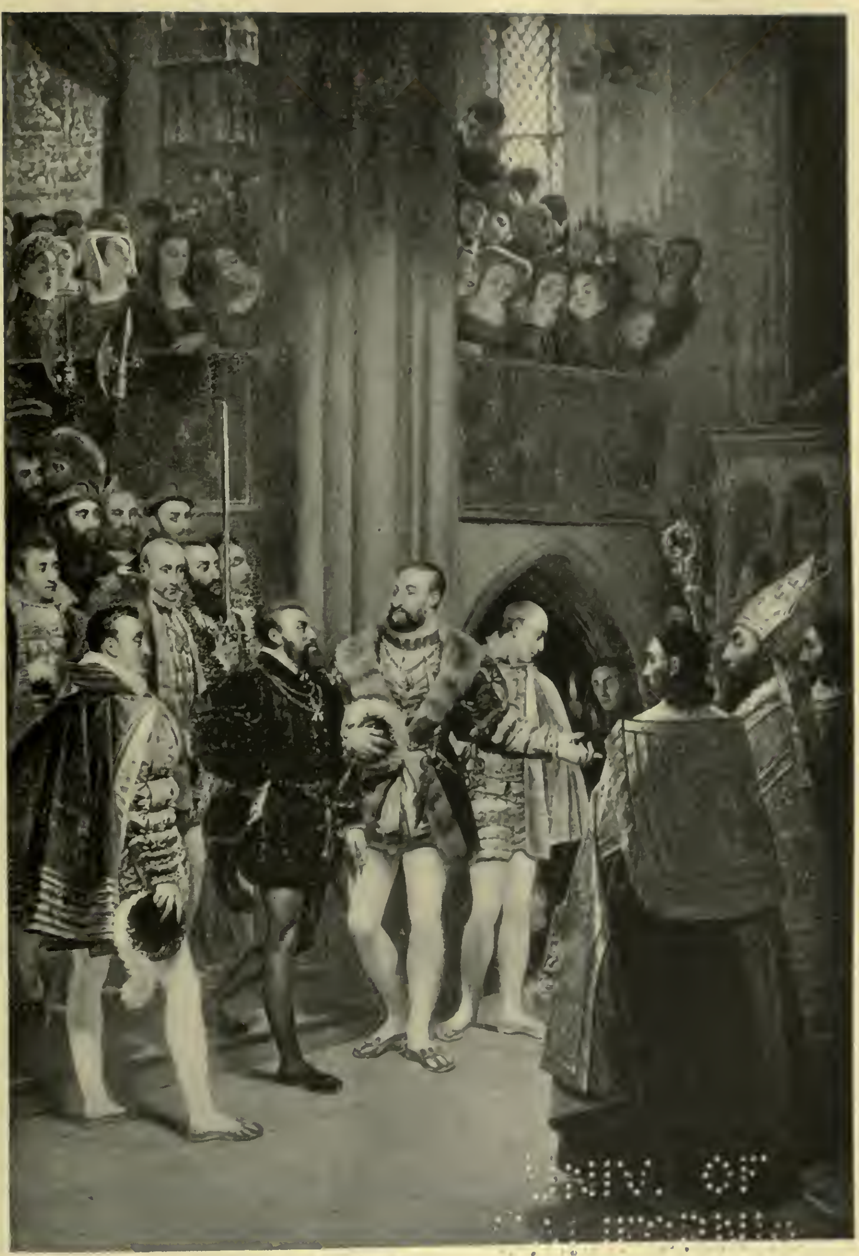
CHARLES V., emperor of Germany, and the most powerful monarch of the sixteenth century, was born at Ghent, East Flanders — now part of Belgium — February 24, 1500. He was the son of Philip, archduke of Austria, and of Joanna, only child of Ferdinand and Isabella, sovereigns respectively of Aragon and Castile. Philip, as the son of Mary of Burgundy, was ruler of the Netherlands; and on his death, in 1506, Charles inherited those provinces and Franche-Comté. Ten years later, in 1516, on the death of his grandfather, Ferdinand, he succeeded to the crowns of Aragon and Castile, under the title of Charles I. of Spain, with all their possessions both in the old and the new world, among these the kingdoms of Naples and Sicily. And, in 1519, on the death of his other grandfather, Maximilian, Charles was elected German emperor from a number of competitors, chiefly through the influence of Elector Frederick of Saxony.

Charles was brought up and educated in the Netherlands, under William de Croy, lord of Chièvres. His education was very complete and tended to make him rather a German in spirit than a Spaniard. In his earlier years he was frivolous and dissolute; but when he fully realized the duties and dignities of his high position, he entered upon them with rare steadfastness and energy. It was only after some delay and with reluctance that he quitted the country of his birth and went to Spain in 1517. Nor was he very favorably received by the Spanish nobles who were doubtful of his right and jealous of the followers whom he brought from the low countries. All the abilities of his famous minister, Ximenes, were requisite to prevent an open revolt.

In 1520 he returned from Spain to Germany; on October 23d of that year he was formally crowned at Aix-la-Chapelle, and received from the pope the title of Roman emperor. On his way he landed at Dover, England, and was accorded an interview with Henry VIII., and his celebrated minister of state, Wolsey. It was the year in which Luther burned the pope's bull, and Solyman the Magnificent became sultan of the Ottomans: two formidable powers with which Charles would have to reckon.

The reign of Charles V. almost exactly coincides with the period of the great religious revolution which changed the relations of many of the states of Europe to the see of Rome and to each other, and put a new face on the western world. At the time of his birth all western Europe was in communion with the Roman church. Before he died a large part of western Europe had separated from that communion, and the various churches were also widely separated from each other. In the long complicated series of actions and events which resulted in this



FRANCIS I. CHARLES V.

CHARLES V. AND FRANCIS I. AT ST. DENIS

From the painting by A. J. Gros

change, Charles V. was one of the five or six most prominent actors.

The vast extent of his dominions, the wealth at his command, and the dignity of emperor made his position the most splendid in Christendom. His power was greater than that of any other emperor since Charlemagne, and he was the last great emperor. If we take Luther as representative of the forces of the reformation, Charles V. may well stand as representative of the forces which opposed it.

The life of Charles V. naturally divides itself into three distinct portions. The first, extending from his birth to his coronation at Aix-la-Chapelle, is the period of growth, acquisition, and ascent; the second, from the breaking out of the war with his rival, Francis I., to his flight from Innsbruck, or his abandonment of the siege of Metz a year later, is full of action, conflict, and endeavor; and the third, including the last five years of his life, with its successive resignations of dominion, its last scenes in the cloister of St. Yuste, is the period of decline and disappointment.

Charles ascended the imperial throne at a time when Germany was in a state of unprecedented agitation concerning the doctrines proclaimed by Luther. To restore tranquillity, a great diet was held at Worms in 1521, at which he presided. Luther's declaration of his principles before this diet forms a well-known and most important passage in the history of the reformation. In 1522 he reduced to subjection the towns of Castile, which had leagued themselves together for the maintenance of their ancient liberties. He was likewise successful in his war against the Turks under Solyman the Magnificent, and in the struggle of long duration with France, in which, after many alterations of fortune, his armies at last drove the French from the greater part of their conquests in Italy. Francis I. of France fell into his hands as a prisoner, after a battle by which the siege of Pavia was raised on February 24, 1525.

The pope, however, began to grow alarmed at his victories, and therefore allied himself with France and the principal Italian states, and released the king of France from the obligations under which he had come by his treaty with Charles. It was the pope's object to exclude Charles from all dominion in Italy; but the emperor's forces under Charles of Bourbon, the former constable of France, took Rome itself by storm in 1527, plundered it, and made the pope prisoner. Charles pretended great regret for this, went into mourning with all his court, and caused prayers to be said for the pope's liberation, while by his own directions the pope was kept for seven months a captive. Peace was concluded at Cambrai in 1529 with the pope and with France, on terms most favorable for the emperor, and in 1530 he was crowned at Bologna king of Lombardy and emperor.

He now thought to put an end to the religious differences in Germany, and to repel the Turks, who had overrun Hungary and laid siege to Vienna. But the diet at Augsburg in 1530 proved how vain was the hope of restoring the former state of things in Germany; and the emperor refusing to recognize the confession of the Protestants, they refused to help him against the Turks. In 1531 the Protestant princes formed the league of Smalcald, and allied themselves with France and England for their own protection. This, and the continued assaults of the Turks, compelled the emperor to yield in some measure to the demands of the Protestants. The emperor then marched against the Turks; but the sultan could not face the emperor, and retired within his own dominions.

Previous to this, troubles had also sprung up in Spain, discontent possessing the nobles, the clergy, and the commons. The last were for a time supported and ultimately abandoned by the two former classes, and Padilla, leader of the commons, was executed. In 1535 Charles undertook an expedition from Spain against the pirate Barbarossa, who had established himself in Tunis, and whose vessels did prodigious injury to the commerce of Spain and Italy. In this expedition he was completely successful, and set free no fewer than twenty-two thousand Christians, who had been held as slaves.

After his return war was renewed with France. A peace was patched up in 1538 in the form of an armistice that was to last for ten years, but it was broken in 1542. Between these years a revolt broke out in Ghent, and Charles hastened in person to suppress it. He stripped the town of all its privileges, held another diet in Germany, and even visited Francis I. in person in Paris. In 1541 he conducted against the pirates of Algiers a fleet which was utterly wrecked by storms. The war with Francis about Milan went on again for three years; the Turkish fleet wintered at Toulon, whereat Henry VIII. was so indignant that he concerted with Charles an invasion of France. This forced Francis to make the unfavorable peace of Crespy in 1544, whereby the contemplated invasion of Henry VIII. was suddenly frustrated.

At the close of the next year the council of Trent met, and two months later Luther died — February, 1546. Charles had always been hostile to the Lutheran movement, both as being generally subversive and as tending to make the princes and cities of the empire more independent of its head. Unity of religion appeared to him — as to every one else at that time — indispensable. What the doctrines should be was in his eyes of minor importance. Accordingly he had procured the convocation of the council of Trent in the hope that some compromise could be effected between the pope and the Lutherans. The latter refused to take part in it, however, and rose in arms the same year. Charles defeated them at Mühlberg and took prisoners Frederick, elector of Saxony, and Philip, landgrave of Hesse, April, 1547. He gave the electorate to Maurice, a kinsman of Frederick, who played him false for some years, and, in 1552, put himself at the head of the Protestants and narrowly missed capturing Charles at Innsbruck.

While the council at Trent seemingly made Catholic and Protestant union impossible, Charles was still aiming at it; and at the diet of Augsburg in 1548 he published the "Interim," a project of a common platform, rejected by both parties. Freedom of worship was at last granted to the Protestants by the treaty of Passau, in 1552, and confirmed three years later by the "peace of religion" at Augsburg.

In 1552 Henry II. of France had seized the three bishoprics of the empire, Metz, Toul, and Verdun. Charles led an army to Metz to retake it; but after a siege of three months he failed, and withdrew. This was his last appearance in the field. Metz remained in the hands of the French until recovered by the Germans in the war of 1870-71.

The emperor's task was now well-nigh done. His main aim in life had been hopelessly crossed; his health was broken by care and toil, and energy and hope were gone. To him, "inheritor of church predilections colored with a religious melancholy," it would seem quite natural to end his days in monastic seclusion. Something like a final flicker of hope appeared in his suggestion in 1554 to his son, Philip, of a marriage with Mary, Queen of England — once his own marriage with her had seemed possible. The marriage took place, but it was childless. Thenceforth the tale is of honors one by one stripped off, and of burdens one by one dropped.

First, in 1554, he gave up the kingdom of Naples and the duchy of Milan to Philip; the next year, in a grand pathetic way in the hall of the estates at Brussels, he resigned to him the Netherlands; he was ill, and leaning on the young prince of Orange — to be known by-and-by as William the Silent — made a short and touching speech, weeping the while. His mother had died six months before. In January, 1556, Spain and the Indies passed into the same hands, and in the following August the imperial dignity was renounced and the crown sent to his brother, Ferdinand.

In September, Charles, accompanied by his two sisters, Eleanor and Mary, both queens, quitted the Netherlands and returned to Spain a few weeks after the death of Ignatius Loyola. And then, worldly ambition and aims all over, he sought repose in the sequestered monastery of St. Yuste, near Plasencia, in Estremadura.

In the cloistered shades Charles took little interest in the world he had quitted; but he still remained hostile to the reformation, and exhorted his children to resist it. In the closing weeks of his life, when mind and body were failing together, he fell into deeper and deeper melancholy and the practice of monastic austerities. It is said that he had his own obsequies performed in his presence in the chapel. Here he died, at the convent of St. Yuste, September 21, 1558.

Charles V. was undoubtedly the greatest monarch of the sixteenth century, and occupied the most prominent place in its annals. He was both a consummate politician and a brave soldier. He was alike bold and sagacious — cautious in the extreme in forming his plans, and prompt as well as indomitably firm and persevering in carrying them into execution. He possessed great skill in reading character, and in selecting counsellors and generals whose abilities were admirably adapted for the duty intrusted to them.

In spite of his plegmatic temperament and reserved disposition, he was good-humored, easy, and affable in his manners, and was always a favorite with the multitude. But his ambition was insatiable, and his policy scheming and insidious. This made him selfish and suspicious, and he was not infrequently as ignoble in his rivalries and aims as he was unscrupulous in the means which he adopted to obtain success.

Though he labored zealously to uphold the Catholic faith, he showed no fanaticism while he wielded the scepter. By his queen, Isabella, daughter of Emmanuel of Portugal, a princess of great beauty and accomplishments, Charles had one son, Philip II., who succeeded him, and two daughters.

"Spain," says Lord Bolingbroke, "figured little in Europe till the latter part of the fifteenth century — till Castile and Aragon were united by the marriage of Ferdinand and Isabella, till the total expulsion of the Moors, and till the discovery of the West Indies. After this, not only Spain took a new form, and grew into immense power, but the heir of Ferdinand and Isabella being heir likewise of the houses of Burgundy and Austria, such an extent of dominion accrued to him by all these successions, and such an addition of rank and authority by his election to the empire, as no prince had been master of in Europe from the days of Charles the Great."

To which the distinguished biographer of Charles V.— Robertson — adds: "It was during his administration that the powers of Europe were formed into one great political system, in which each took a station, wherein it has since remained with less variation than could have been expected after the shocks occasioned by so many internal revolutions and so many foreign wars. The great events which happened then have not hitherto spent their force. The political principles and maxims, then established, still continue to operate. The ideas concerning the balance of power, then introduced or rendered general, still influence the councils of nations. The age of Charles V. may therefore be considered as the period at which the political state of Europe began to assume a new form."

HUGO DE GROOT, or Hugo Grotius, as he is more generally designated, Dutch jurist and statesman, and founder of international law, was born at Delft, Holland, April 10, 1583. On both sides his family was of ancient and noble extraction. His father, John de Groot, was curator of the university of Leyden, besides being a lawyer and poet of considerable reputation.

The mind of Grotius developed with remarkable rapidity. In his ninth year he composed Latin verses; at twelve he entered the university of Leyden; and at fifteen he received his doctorate in law from the university of Paris. His *Martianus Capella*, a prodigy of juvenile learning, exhibiting critical readings from the works of Apuleius, Albericus, Cicero, Aquila, Porphyry, Aristotle, Strabo, Ptolemy, Pliny, Euclid, and many other ancient and modern authors, in different languages and on various subjects, was published when he was but sixteen.

In the following year Grotius published the "Phenomena of Aratus," an astronomical poem, written originally in Greek, and translated into Latin by Cicero, when a very young man. Part of Cicero's translation had been lost in course of time; and in this publication the deficiencies were supplied by Grotius in Latin verse with much elegance and success.

He had always been intended for the profession of the law; and lest the allurements of general literature, and the flattery of successful authorship, which had greatly withdrawn him from his legal studies, would lead him to renounce the employment for which he was designed, his father sought to turn his thoughts into a new channel. It happened that in the year 1598 the celebrated grand pensionary, Barneveldt, was sent on an embassy from the Dutch states to Henry IV. of France, for the purpose of persuading him to conclude a new treaty of perpetual alliance with Holland and England against Spain. John de Groot readily obtained for his son a situation in the suite of Barneveldt.

Grotius remained in France for something like a year, and during that time was treated with marked distinction and respect by the learned men of that country. He was also graciously noticed by the king himself, who gave him at his departure his own portrait and a chain of gold. For some unexplained cause, Grotius did not upon this occasion become acquainted with the famous French historian and statesman, De Thou; but soon after his return to Delft, he wrote him a letter accompanied by a copy of his "Aratus." From that time until the death of De Thou a constant correspondence was maintained between them, and Grotius furnished many notes and materials for that part of De Thou's history which related to the Netherlands and Holland.

Immediately after his return from France to Holland in April, 1599, Grotius published a treatise for the instruction of seamen in ascertaining the exact situation of a ship at sea. This work was merely a translation, and has been of course long since superseded by modern discoveries; but it is worthy of remark, as a proof of the extraordinary acquirements of a youth of sixteen, that he should have added to his critical and scholastic knowledge so competent an acquaintance with magnetism and practical navigation as the translation of such a work implies.

In the course of the same year he enrolled himself on the list of advocates at The Hague, and commenced the actual practice of his profession. In this occupation he was eminently successful, though he always disliked it, and lamented the time which it claimed from more congenial pursuits. His reputation and practice, however, daily increased, and in the year 1607, by the recommendation of the courts, he was nominated by the states of Holland to the responsible office of advocate general of the provinces of Holland and Zealand. Soon after this appointment he married Mary Reygersburgh, the daughter of a wealthy family in Zealand, with whom he lived in the most complete harmony.

In the year 1608, while he held the office of advocate general, Grotius composed his *Mare Liberum*, the general design of which was to show, upon the principles of the law of nations, that the sea was open to all without distinction, and to assert the right of the Dutch states to trade to the Indian seas, notwithstanding the claim of the Portuguese to an exclusive title to that commerce. Soon after its appearance, he published a "Dissertation on the Antiquity of the Batavian Republic," for which he received the thanks of the states of Holland, accompanied by a present.

In 1613 he was advanced from his practice as an advocate to the judicial station of pensionary of Rotterdam, which office was given him for life, the usual tenure having been only at will. Soon afterward a difference of opinion having arisen between England and the states of Holland, respecting the rights of fishing for whales in the northern seas, Grotius was sent to England for the purpose of effecting an amicable arrangement of the dispute. He there became personally acquainted with Isaac Casaubon, the English Protestant theologian, with whom he had previously corresponded. He was also favorably noticed by the king during his stay in England, and formed an intimate connection with several of the eminent English divines of that day, which he maintained by letters for many years afterward. In the political object of his embassy he appears to have failed; the subject in dispute was resumed at Rotterdam in 1615 before commissioners of both countries, but with no more favorable result to the Dutch states.

Soon after his return from England, Grotius became deeply involved in the religious animosities which at that time prevailed in Holland. He had adopted the principles of Arminius from Uitenbogard, the instructor of his early youth, and he now zealously maintained the doctrines of the Arminian party in opposition to the tenets held by the followers of Gomar, the Calvinistic controversialist. Frequent riots ensued, attended with popular demonstration of an alarming kind. The powerful city of Amsterdam favored the Gomarists; and under these circumstances the states sent a deputation, of which Grotius was the chief, for the purpose of converting the town council of that city to their opinion. Upon this occasion Grotius made a judicious and temperate harangue, which was afterward translated into Latin, and is published among his works. It was, however, unsuccessful in its results.

In the meantime popular tumults continued and increased; and in this position of affairs the grand pensionary, Barneveldt, proposed to the states of Holland that the magistrates of the several revolting cities should be authorized to levy soldiers for the purpose of securing the public tranquillity. The representatives of several towns vehemently opposed this proposition, but it was adopted after a stormy debate; and on August 4, 1617, a proclamation was issued to carry it into execution.

This decree directly induced a train of circumstances, which eventually led to the death of Barneveldt, and the ruin and banishment of Grotius. Prince Maurice of Nassau, who was at that time governor and captain-general of the united provinces, denounced it as an act illegal and unjustifiable in itself, and an invasion of his authority. He influenced the states-general to write to the magistrates of those provinces and cities which had acted under the decree by raising soldiers, commanding them to disband their levies. Upon the refusal of many of them to comply with this requisition, he obtained authority to proceed to the recusant cities and enforce their obedience.

The states of Holland had in the meantime sent Grotius and Hoogerbeets, the pensionary of Leyden, for the purpose of opposing the prince's commission. They stimulated the magistrates of the city to resist the assumed authority of the states-general, to increase their militia, and to double the guards at the gates. They also brought letters from the states of Holland to the officers of the ordinary garrison, persuading them that it was their duty to obey the states of Utrecht, in opposition to the states-general and the prince of Orange. Notwithstanding these preparations the prince entered the city without forcible resistance, and, having disbanded the new levies, displaced several magistrates, and arrested some of those who had been most active in their opposition, returning to The Hague. Grotius was now satisfied that all further attempts at opposition would be useless, and prevailed upon the magistrates of Rotterdam at once to dismiss the levies under the obnoxious decree.

The prince of Orange and the states-general were highly incensed at the measures taken to excite a forcible opposition at Utrecht. Barneveldt, Grotius, and Hoogerbeets were arrested August 29, 1618, upon the charge of having raised an insurrection at that place, and committed to close custody in the castle of The Hague.

In the ensuing year the prisoners, having previously undergone repeated examinations, were separately tried before twenty-six commissioners, chosen from the principal nobility and magistracy of the seven provinces. Barneveldt was tried first, and was condemned to be beheaded for various acts of insubordination toward the states. The trial of Grotius followed a few days afterward; he was found guilty, condemned to imprisonment for life in the castle of Loevestein, and his estate confiscated. At first he was kept a close prisoner. His father was refused permission to see him, and his wife was admitted only on condition of sharing his imprisonment, being told that if she left the castle she would not be allowed to return. These restrictions were afterward, however, considerably relaxed. His wife obtained leave to quit the castle twice a week. Grotius was permitted to borrow books, and to correspond with his friends on all subjects except politics.

It is not for such minds as that of Grotius that "stone walls can make a prison." During nearly two years of close imprisonment, with no society but that of his wife, who constantly remained with him, he employed himself in digesting and applying those stores of learning which he had previously acquired, and study became at once his business and consolation. "The Muses," he says, in a letter to Vossius during his confinement, "are a great alleviation of my misfortune. You know that when I was most oppressed by business, they furnished my most delightful recreation; how much more valuable are they to me now, when they constitute the only enjoyment which cannot be taken from me!"

During his captivity he occupied much of his time in legal studies, of which other pursuits had for some years caused an intermission; but his favorite employment appears to have been theology, and especially a laborious and critical examination of the sermon on the mount. He also at this time wrote a treatise in the Dutch language on the "Truth of the Christian Religion," which a few years afterward, while at Paris, he enlarged and translated into Latin. In its improved state it became more generally known and more popular than any of his previous works, and was translated during the seventeenth century into the English, French, Flemish, German, Persian, Arabic, and Greek languages. This treatise was well worthy of the great attention which it excited. In point of force of argument and clearness of arrangement it will not suffer in comparison with the work of Paley, and other popular modern writers on the same subject, while in temper and candor it is superior to most of them.

In the early part of 1621, after nearly two years had been passed by Grotius at Loevestein, the fertile invention of his wife devised the means of his escape. It was his practice to return the books, which he borrowed from his friends, in a large chest, in which his wife sent linen from the castle to be washed at Gorcum. During the first year of his imprisonment the guards invariably examined this chest before it left the castle, but, as they continually found nothing but books and soiled linen, they gradually relaxed in their search. Grotius' wife resolved to turn their negligence to her husband's advantage.

During the absence of the governor from the castle, Grotius was placed in the chest, and, holes having been bored in it by his wife in order to admit air, it was carried down from the castle by two soldiers on a ladder. One of the soldiers, suspecting something from the weight, insisted upon taking it to the governor's house to be opened; but the governor's wife, who was probably in the secret, told him she was well assured that the chest contained nothing but books, and ordered him to carry it to the boat. In this manner Grotius crossed the water and arrived safely at a friend's house in Gorcum. He then passed through the streets in the disguise of a mason, and stepped into a boat which took him to Brabant, from whence he afterward escaped to Antwerp. Upon the first discovery of the trick which had been practiced upon him by the wife of Grotius, the governor of Loevestein confined her rigorously; but she was discharged upon presenting a petition to the states-general.

On the advice of various powerful friends in France, Grotius determined to make Paris his city of refuge. He was well received in the French metropolis, both by learned men and politicians, and in the beginning of the following year was presented to the king, who bestowed upon him a pension of three thousand livres. In the year 1622 he published his "Apology," in which he vindicated his conduct from the particular charges which had formed the subject of the proceedings against him, and argued against the legality of his sentence and the competency of the tribunal by which he was tried. His work excited much attention throughout Europe, and greatly irritated the states-general, who published so violent an edict against it that the friends of Grotius entertained fears for his personal safety. In order, therefore, to place himself more fully under the protection of the French government, he obtained letters of naturalization from Louis XIII.

In 1625 he completed his greatest work, *De Jure Belli et Pacis* — "The Law of War and Peace" — which was published at Paris in that year. None of the works of Grotius excited so much attention as this treatise. It was the first attempt to reduce into a system the subject of international law; and the industry and extensive learning of the author well qualified him for the task. More complete and useful works upon this subject have been written since the time of Grotius; but, in order to estimate properly the magnitude and value of his labors, it must be considered that, before he wrote, the ground was wholly unbroken. In his own age, and in that which succeeded it, this work was held in the highest esteem, and was translated into the chief European languages. In fact, it long continued the standard work on international law.

Grotius remained more than nine years in France, and during that period published, in addition to the works already noticed, several theological treatises of small interest at the present day. The latter part of his residence in France was rendered uncomfortable by several disagreeable circumstances. By not paying sufficient court to Richelieu, Louis's minister of state, Grotius lost the king's favor, and, in 1631, his pension was withdrawn.

A friendly letter from Prince Frederick of Orange induced him to return to his native country; but by the intrigues of his enemies sentence of perpetual exile was passed upon him. He now removed to Hamburg, and while there he received invitations from the kings of Denmark, Poland, and Spain; but the protection promised him by the chancellor Oxenstiern and Queen Christina's taste for literature induced him to enter the Swedish service in 1634. He was then appointed resident ambassador of the infant

UNIV. OF

queen at the court of France in the following year.

As ambassador at the French court Grotius gained universal respect. On his return to Sweden he passed through his native country, and was received in Amsterdam with the most distinguished honor. Equally flattering was his reception by the Swedish queen; but the literary dilettantism of Christina's court did not suit so serious and solid a scholar, whose thoughts were always of the broadest and most forecasting nature. Besides, the climate of Sweden did not agree with him, and he was probably anxious to spend the evening of his life in his native land. In consequence, he sent in his resignation of office to the queen, who, when she found that nothing could induce him to stay, presented him with a sum of ten thousand crowns, and some costly plate, besides placing at his disposal a vessel to conduct him down the Baltic to Lübeck.

Grotius had scarcely put to sea; when a violent storm arose and drove the vessel into a port near Dantzic. From this place he set out in an open carriage, in the most inclement weather, intending to return to Lübeck, and arrived at Rostock on his way thither, August 28th. He there complained of extreme illness, and desired a physician. It was soon discovered that his end was approaching. A clergyman, named Quistorpius, also attended him, and has given an interesting account of his last moments. Grotius died in the night of August 28, 1645. His body was carried to Delft, and laid in the tomb of his ancestors. In modern times a handsome monument has been erected to his memory.

To the talents of a most able statesman, Grotius united deep and extensive learning. He was a profound and enlightened theologian — perhaps the best exegete of his day, a distinguished scholar, an acute philosopher, a judicious historian, and an able jurist. Altogether, he was what Ménage, the French philologist, called him, "a monster of erudition." Personally he was distinguished for sincere piety, and his character combined mildness with remarkable energy.

OLIVER CROMWELL, lord protector of England, Ireland, and Scotland, and one of the most extraordinary men in English history, was born at Huntingdon, England, April 25, 1599. He was the eldest surviving son of Robert Cromwell, a substantial country gentleman, and Elizabeth Steward, a daughter of William Steward of Ely. He was first cousin to John Hampden, the celebrated English statesman.

Educated at Huntingdon grammar school and at Sidney Sussex college, Cambridge — which he entered in 1616 — Cromwell seems to have carried away a modest share of classical and general culture. He then went to London to study law. In 1617 his father died, leaving him a moderate estate at Huntingdon; and in 1620 he married Elizabeth, daughter of Sir James Bourchier, a London merchant. He embraced Puritanism in its most enthusiastic form, and supported the ministry of its proscribed preachers. In 1628 he sat for Huntingdon in the stormy third parliament of Charles I., and raised his voice against Romanizing ecclesiastics. Then he returned to farming at Huntingdon, whence he removed to St. Ives and afterward to Ely, where property had been left him by his uncle. He appears to have come into collision as a local patriot with the king's commissioners for the drainage of the fens, and in the contest was successful.

In 1640, when forty-one, he was sent to parliament for the town of Cambridge, and his political history really began with the meeting of the long parliament in that year.

Ranged on the side of his celebrated relative, Hampden, he warmly supported all the measures that tended to disarm royalty and invest parliament with the supreme power. No one foresaw the great future in store for him. He appeared only an ordinary country gentleman, skilled neither in intrigue nor speech, showing himself excessively zealous in his opinions, and often carried to extremes by them. He had a burly figure and ruddy face; his coat was rough and his linen not scrupulously clean; his voice was sharp and irritating, his manner vehement, and he had sometimes to be called to order.

The causes which led up to the English revolution, in which Cromwell was so conspicuous a figure, were chiefly the arbitrary and despotic measures, and the tyranny and maladministration of the weak and obstinate Charles I., who did his best to carry out the doctrine of the "divine right of kings." It was this that brought on the long struggles between the sovereign and parliament, and finally resulted in the execution of Charles, and the establishment, by parliament, of the form of government called the "commonwealth," which existed during the protectorate of Oliver Cromwell and his son Richard until the abdication of the latter in 1659.

On the royalist side were most of the nobility, clergy, the gentry who adhered to the established church, and the Catholics. On the side of parliament were the middle classes of the kingdom, the country farmers, townspeople, and the dissenters or Puritans. The adherents of the king were called cavaliers; the Puritans wore the nickname of roundheads, from the fashion of having their hair cropped.

The utmost that was aimed at by parliament at the time when Cromwell entered it was to draw to themselves more of governmental power, dreaming possibly of the triumph of Presbyterianism over the established church. Cromwell, vehement and zealous Puritan as he was, had higher hopes, and, though no doubt wishing liberty of conscience for all, he desired the preponderance of his own special opinions. When all hope of reconciliation between king and parliament failed, through the perfidy of the former, Cromwell was among the first to offer of his substance to aid in defense of the state, In July, 1642, he moved in parliament for permission to raise two companies of volunteers in Cambridge, having been careful to supply the necessary arms beforehand at his own cost.

He remarked the inferiority of the parliamentary soldiers, who were for the most part mercenaries, serving-men to the gentlemen of the royal army, and then he discovered to what force he must appeal. The chivalrous spirit was wanting, he must appeal to the religious; to fight against men of honor he must have men of religion. On this plan he began to recruit his squadrons from the ranks of the farmers, men hardy and used to labor and fatigue, who went into the war with the ardor of religious conviction.

In the following month Cromwell seized the magazine in Cambridgeshire, and prevented the royalists from carrying off the plate — valued at twenty thousand pounds — in the university there. As captain of a troop of cavalry, Cromwell exhibited astonishing military genius; and against the men trained by himself —"Cromwell's Ironsides" — the battle-shock of the fiery Rupert, which at the beginning of the parliamentary struggle none else could withstand, spent itself in vain. Promoted to the rank of colonel, then to that of lieutenant general, Cromwell, in the fight of Winceby, October 11, 1643, on the bloody field of Marston, July 2, 1644, and in the second battle of Newbury, October 27, 1644, bore himself with distinguished bravery; but, owing to the backwardness of his superiors, the results of these victories to the parliamentary cause were not so great as they might reasonably have been.

Parliament became uneasy at this position of affairs, and tried to curtail Cromwell's power, and make terms with the half-conquered king. But Cromwell, secure in the favor of the army, proposed and caused to be adopted the famous Self-denying Ordinance which interdicted all members of parliament from military charge. Yet the army could not do without Cromwell, and by a special dispensation he was allowed to keep his own. By the Self-denying Ordinance the army was rid of its grandees, remodeled, and the war pushed forward with fresh vigor.

Of the new model army, Fairfax was appointed general, Cromwell serving under him as lieutenant general of the cavalry. In this capacity he commanded the right wing of the parliamentary army at Naseby, June 14, 1645, and acquitted himself so well there that the king's forces were utterly ruined. The royalists in the west were now speedily reduced. Bristol was stormed; everywhere the royal cause was failing; and Charles himself, reduced to the last extremity, on April 27, 1646, escaped from Oxford in disguise. He threw himself into the arms of the Scotch army at Newark, May 5, 1646, by which he was shortly given up to the parliamentary commissioners.

The source of the strife now fairly within their grasp, parliament and the army, in the former of which the Presbyterian and in the latter the independent element predominated, became jealous of each other's power. With his usual sagacity, Cromwell perceived that the advantage would lie with that party who held possession of the king's person, and with ready decision he had him removed from the hands of the commissioners into those of the army, June, 1647. Some of the leading Presbyterians were now turned out of parliament by the army, and independency, with Cromwell at its head, was gradually obtaining the ascendancy. The king still remained with the army, and with his usual duplicity negotiated with both parties, not without hope that out of their mutual dissensions might arise advantage to himself. On November 11, 1647, the king made his escape from Hampton court. Two days after he was in custody of Colonel Hammond in the isle of Wight. At this time the country was in a critical condition. The Welsh had risen in insurrection, a Scotch army was bearing down from the north with hostile intent, and Rupert, to whom seventeen English ships had deserted, was threatening a descent from Holland, not to speak of the rampant royalism of Ireland. Prompt measures alone could prevent anarchy and inextricable confusion, and Cromwell was not afraid to employ them. Pembroke had to surrender, and at Preston Moor the Scotch were utterly defeated.

The great year 1648 showed England split into many parts: "a king not to be bargained with, a great royalist party, a great Presbyterian party, at the head of which is London, and lastly, a headstrong, mutinous republican and leveling party." The army, menaced with dissolution by parliament, raised themselves against it, and expelled over a hundred of its hostile members. "They are malignants," said Cromwell, "and the house must be purged of them. Thou wilt go with a troop of horse and a regiment of foot, and thou wilt take those men away; they may sit no longer." Colonel Pride, with his soldiers, surrounded the house, and when it adjourned seized the obnoxious members one by one as they passed out, and marched them off. The remainder passed the bill for the king's trial.

Then came the order for execution: "Whereas, Charles Stuart, king of England, is convicted of high treason and sentenced to have his head severed from his body, these are to will and require you to see the said sentence executed in the open street before Whitehall.— Signed, John Bradshaw, Thomas Grey, Oliver Cromwell, and fifty-six others." This deed was considered by Carlyle the most daring action any body of men with clear consciences ever set themselves to do. The king was accordingly executed, January 30, 1649.

Parliament now proclaimed that "the people of England are hereby constituted, made, established, and confirmed to be a commonwealth, a free state, and shall henceforth be governed as a commonwealth, or free state, by the supreme authority of this nation, the representatives of the people in parliament, and that without any king or house of lords. Forasmuch as all power is originally and in reality vested in the collective people of this nation, the free choice of their representatives, and their consent is the sole basis of a lawful government, while the end of government is the common weal." Elections were to be held every two years; the representatives were to legislate, administer, execute, yet only as the servants of the people. There was to be equality before the law; no one was to serve in the army against his will; government was to have no decision in matters of religion, and so on.

The abolition of the house of lords followed speedily, and Cromwell became a prominent member of the new council of state. In the army, though still only lieutenant general, he had really much more influence than the commander-in-chief. The royalists being still strong and rebellious in Ireland, Cromwell went thither in August, 1649, with the title of lord lieutenant, and commander-in-chief of the army there; and before nine months had passed, he had subdued the country so far that it might be safely left to the keeping of his son-in-law, Ireton. Cromwell's measures for crushing the Irish rebels were indeed severe, and even sanguinary, but, nevertheless, peace and prosperity followed in a degree unknown before in the history of that unhappy country.

Affairs in Scotland now claimed Cromwell's attention. Scotch commissioners had been negotiating with Charles II. at Breda, had urged him to come among them and take the covenant, and they would crown him king over them at least, and do what force of arms could do to make him king of England also. Charles arrived in the north of Scotland on June 23, 1650, and after taking the covenant was proclaimed king. Three days thereafter — Presbyterian Fairfax having refused to fight against the Presbyterian Scotch — Cromwell was appointed commander-in-chief of all the parliamentary forces. On September 3d following, Cromwell routed the Scotch army at Dunbar. Charles, with what force remained, and other accessions, afterward marched southward in 1651. He had penetrated to Worcester, when Cromwell came up with him, and utterly overthrew the royalists on September 3d — the anniversary of the battle of Dunbar. This battle, which ended the civil war, placed Cromwell avowedly at the head of public affairs in England. To write his biography from this time until his death would be to write the history of the commonwealth.

In April, 1653, came the dissolution of parliament. That body being highly offended at the presumption of the army, the lord general was compelled to do a thing which, as he said, "made the very hairs of his head to stand on end." Hastening to the house of parliament with three hundred soldiers, and the marks of violent indignation on his countenance, he entered. Stamping with his foot, which was the signal for the soldiers to enter, the place was immediately filled with armed men. Addressing himself to the members: "For shame," said he, "get you gone; give place to honester men, to those who will faithfully discharge their trust. You are no longer a parliament; I tell you you are no longer a parliament; the Lord has done with you."

Sir Harry Vane exclaimed against this conduct. "Sir Harry," cried Cromwell, in a loud voice, "Oh, Sir Harry Vane; the Lord deliver me from Sir Harry Vane." He then in a violent manner reproached certain of the members by name with their vices. "It is you," continued he, "that have forced me to do this. I have sought the Lord night and day that He would rather slay me than put me upon this work." Then, pointing to the mace, "Take away that bauble!" cried he. Then, turning out all the members and clearing the hall, he ordered the doors to be locked, and, putting the key in his pocket, returned to Whitehall.

He now convened a parliament — which consisted wholly of godly men — numbering one hundred forty persons, one hundred thirty-eight of whom assembled on July 4, 1653; but he found it necessary to dissolve it on December 12th, its one great work having been the legal investiture of Cromwell with the supreme power and the title of lord protector, a position upon which the principal powers of Europe hastened to congratulate him.

His second parliament, from which the recalcitrants were excluded at the outset, offered him the title of king. Cromwell wavered; but the stubborn resistance of the republican soldiers decided him to decline the offer. The house of lords was, however, restored; the protector was empowered to name his successor; fixed revenue was voted to him; and he was installed as protector with a ceremonial resembling a coronation.

When parliament met again, its two houses fell into a collision which compelled Cromwell to dissolve it; and his power thenceforth rested upon the army, though it was his constant desire to revert to constitutional government. His protectorate was a perpetual conflict with republican resistance on the one hand and with royalist plots and risings on the other, while his life was constantly threatened by royalist assassins. Yet he was able to inaugurate a great policy, home and foreign. He reorganized the national church on the principle of comprehension, including all but papists, prelatists, and antitrinitarians, while the ministry was weeded by commission. He upheld toleration as far as he could, and curbed the persecuting tendencies of parliament. For law reform he did his best. He united Scotland and Ireland to England, giving them both representation in parliament. Scotland, having free trade with England, enjoyed great prosperity under his rule. Ireland he sought to make a second England in order and industry, though his measures were high-handed. He saved the universities from the fanatics, put good men at their head, and encouraged letters.

But his foreign policy brought him most renown. Under him the commonwealth became the head and protectress of Protestant Europe. He made peace with Holland, tried to form a league of all the Protestant states, and protected the Waldenses. In the interest of religious liberty and commerce he allied himself with France against Spain. He took Jamaica, and Blake's naval victories over the Spaniards brought at once glory and treasure. His troops, with those of France, won the battle of the Dunes, and he obtained Dunkirk. He sedulously fostered British commerce, and by the hand of Blake chastised the pirate states of Barbary. His boast that he would make the name of Englishman as respected as that of Roman had been was fulfilled.

The death of his favorite daughter, Elizabeth Claypole, in the summer of 1658, had a serious effect upon Cromwell, worn as he was in both body and mind. He was seized with a tedious fever, and on September 3d — the anniversary of Dunbar and Worcester — he expired.

His remains were buried in Westminster abbey, but after the restoration of the Stuarts, on the anniversary of the death of Charles I., his grave, along with those of Ireton and Bradshaw, was broken open, the coffins dragged to Tyburn, where the mouldering bodies were hanged, and then thrown into a deep hole under the gallows, while their heads were set upon poles on the top of Westminster hall. Such was the sacrilegious brutality of the king and the clergy — for the deed was done by their authority — toward England's greatest reformer.

In personal appearance, Cromwell had a manly, stern look; he had a head which any one might see was a vast treasury under strong moral restraint. He was compassionate even to an effeminate measure. He was of an active, healthful constitution, able to endure the greatest toil and fatigue. His body was compact and strong, about five feet ten inches in height. Though brave in his person, he was wary in his conduct; for, from the time he was first declared protector, he always wore a coat of mail under his clothes. His conversation among his friends was very diverting and familiar, but in public reserved and grave.

He was sparing in his diet, though he would sometimes drink freely, yet never to excess. He was moderate in all other pleasures; and, from what was visible, free from immoralities, especially after he became a figure of prominence in the world. He was always a most loving husband and father, and the palace of the protector was a virtuous English home. His speeches are very rough and unmethodical as compositions, but they are marked by sense, force, and intensity of purpose.

It must be added, also, that, like all Puritans, Cromwell was a friend to learning. He supported the two universities "which have not given so good an account of themselves in all categories, human and divine, before or since." At Durham he founded a college for literature and all the sciences. His son he directed to the study of history, mathematics, and cosmography. He formed a library, drew to him men of learning, patronized painting, loved music, and favored entertainments. He was tolerant in religion, regarding Catholics without ill-will, yet earnestly devising the alliance of all the Protestant states.

He affected, for the most part, a plainness in his clothes; but in them, as well as in his guards and attendants, he appeared with magnificence upon public occasions. His court was simple and frugal, yet dignified; and though there was a strain of rusticity in his character — as illustrated in occasional horseplay — his bearing in public upheld the majesty of the state. No man was ever better served, or took more pains to be so. As he was severe to his enemies, so was he beneficent to his friends; if he came to hear of a man fit for his purpose, though ever so obscure, he sent for him, and employed him, suiting the employment to the person and not the person to the employment. Upon this maxim in his government depended, in a great measure, his successes.

It was long a fashion with historians, content to rely upon the calumnies and falsehoods of royalist writers, to represent Cromwell as a monster of cruelty and hypocrisy — a man with a natural taste for blood, who made use of religious phraseology merely to subserve his own ambitious ends. However, after the researches of Carlyle and Guizot, the eloquence of Macaulay, and the clear statement and sound sense of Forster, such a view can no longer be upheld. "The success by which the English revolution was crowned," writes Guizot, "has not only been permanent, but has borne a double fruit; its authors founded constitutional monarchy in England, and their descendants founded the republic of the United States. At the close of the eighteenth century France entered on the path thus opened up. Europe now rushes headlong in the same direction. The revolution that took place in Germany in the eighteenth was political, not religious. It was the peculiar felicity of England in the seventeenth century that the spirit of religious faith and the spirit of political liberty reigned together, and she entered upon the two revolutions at the same time."

Cromwell's religion was no mere profession, it was the very essence of the man; by nature he was not a bloodshedder, and when necessity demanded the grim exercise of the sword, he unsheathed it with reluctance. Never was a religious man less of a bigot; he would not, in so far as his iron will could effect his purpose, permit any one to be persecuted for religious opinions. He delivered Biddle, the founder of English Unitarianism, out of the hands of the Westminster divines. He would have given even the despised and persecuted Jews the right hand of citizenship. He grasped power, and dispensed with the formality of parliaments, only because he sought to promote in the speediest possible manner the prosperity, happiness, and glory of his native land.

Professor Gardiner, dwelling on Cromwell's place in the development of the English people, after a careful review of his career, concludes in these words: "What may be fairly demanded alike of Cromwell's admirers and of his critics is that they shall fix their eyes upon him as a whole. To one of them he is the champion of liberty and peaceful progress, to another the forcible crusher of free institutions, to a third the defender of oppressed people, to a fourth the assertor of his country's right to dominion. Every one of the interpreters has something in which to base his conclusions. All the incongruities of human nature are to be traced somewhere or other in Cromwell's career. What is more remarkable is that this union of apparently contradictory forces is precisely that which is to be found in the English people, and has made England what she is at the present day. With Cromwell's memory it has fared as with ourselves. Royalists painted him as a devil. Carlyle painted him as the masterful saint who suited his peculiar Valhalla. It is time for us to regard him as he really was, with all his physical and moral audacity, with all his tenderness and spiritual yearnings, in the world of action what Shakespeare was in the world of thought, the greatest because the most typical Englishman of all time. This, in the most enduring sense, is Cromwell's place in history."

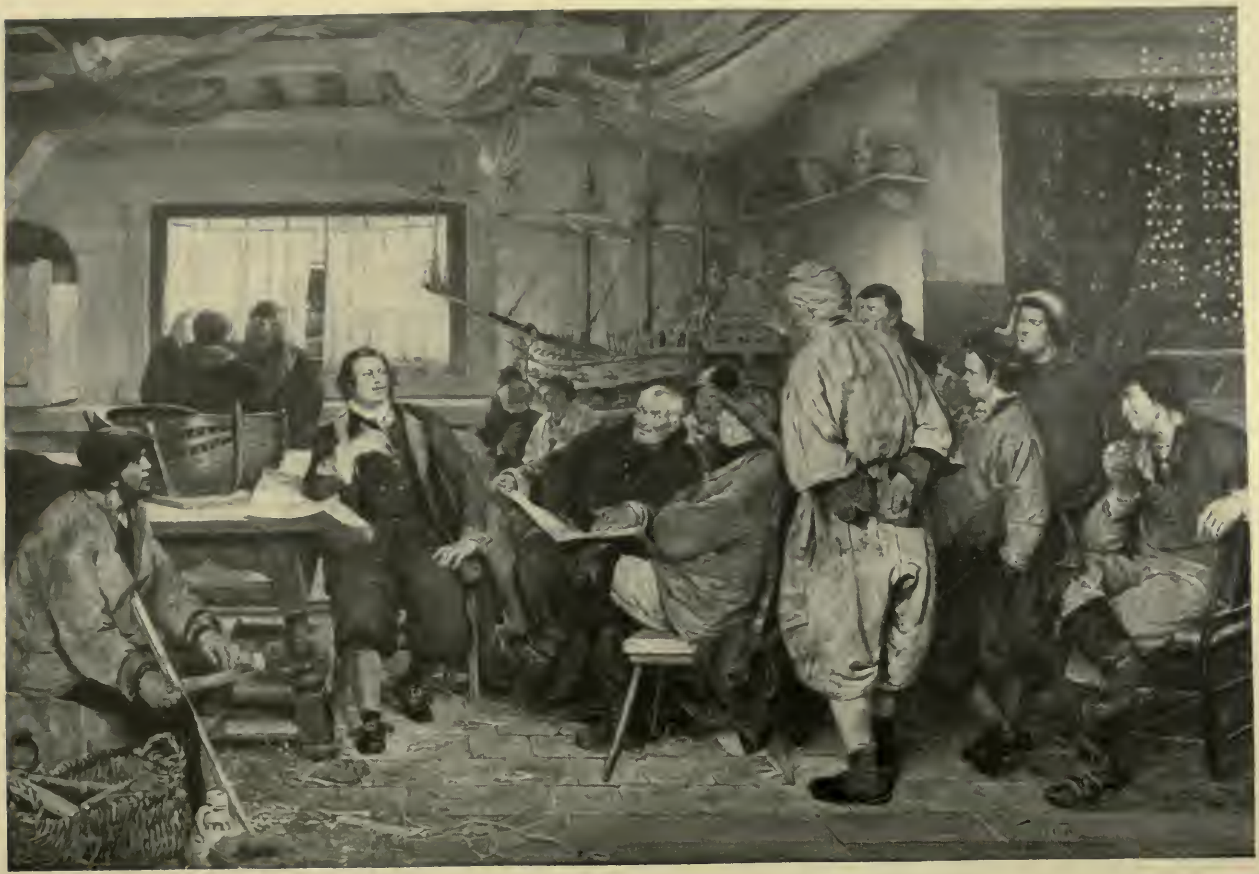
PETER THE GREAT, or Peter I., Alexeyevitch, czar and civilizer of Russia, was born on June 9, 1672, at Moscow. He was the son of Czar Alexis Mikhailovitch by his second wife, Natalia Narishkina. His father died in 1676, leaving the throne to his eldest son, Feodor, Peter's half brother. This prince, however, died in 1682 without issue, after naming Peter as his successor, to the exclusion of his own full brother, Ivan.

This step immediately provoked an insurrection fomented by the children of the czar Alexis' first marriage, the most prominent among whom was the grand duchess Sophia, a woman of great ability and energy, but of unbounded ambition. Disdaining the seclusion customary among the ladies of the royal family, she presented herself to the strelitz, who were the established guard of the czars, excited them to fury by an ingenious story of the assassination of her brother, Ivan, and then let them loose on the supporters of Peter's claims. After a carnage of three days, during which more than sixty members of the



PETER THE GREAT IN HOLLAND
From the painting by Coyen

most noble families of Russia were massacred, she succeeded in obtaining the coronation of Ivan and Peter as joint rulers, in 1682, and her own appointment as regent.

Up to Peter's coronation his education had been greatly neglected, but after this time he became acquainted with Lieutenant Franz Timmermann, a native of Strassburg, who gave him lessons in military art and in mathematics. Afterward he had the good fortune to fall under the guidance of Lefort, a native of Geneva, who initiated him into the sciences and arts of civilization, and, by showing him how much Muscovy was in these respects behind the rest of Europe, influenced the whole of his future career. Lefort also formed a small military company out of the young men of noble family who attended Peter, and caused Peter himself to pass by regular steps from the lowest — that of drummer — to the highest grade in it, rendering him all the while amenable to strict discipline. This course of training, in all probability, saved Peter from becoming the mere savage despot, which his brutal and passionate disposition and indomitable energy inclined him to be. It also protected him from the jealousy of his half sister, the regent Sophia, who, seeing him absorbed in military exercises and other studies, imagined that he had given himself up wholly to amusement.

She, however, soon discovered her error, for Peter, contrary to her wishes, married, in February, 1689, by his mother's advice, Eudoxia Feodorowna Lopukhin, and in October of the same year called upon his sister to resign the government. In the ensuing contest Peter was at first worsted, and compelled to flee for his life; but he was speedily joined by the foreigners in the Russian service, with a Scotchman, named Patrick Gordon, and the Swiss, Lefort, at their head. The strelitz, who were his antagonist's mainstay, flocking to his standard, Sophia resigned the contest, and was shut up in a convent, whence, until her death in 1704, she did not cease to annoy him by her intrigues.

On October 11, 1689, however, Peter made his public entry into Moscow, where he was met by Ivan, to whom he gave the nominal supremacy and precedence, reserving the sole exercise of power for himself.

In 1688 Peter discovered a small Dutch vessel in an old building, where it lay useless. It was repaired and launched. This scene made a wonderful impression on Peter's mind, and he conceived the idea of forming a navy — a design which at that time probably seemed next to impossible even to himself. His first care was to procure Hollanders to build some small vessels at Moscow, and afterward four frigates of four guns each on the lake of Pereslave. He then brought them to combat one another. He passed two summers successively on board English or Dutch ships, which set out from Archangel, in order to instruct himself in naval affairs.

In 1696 Czar Ivan died, and Peter was now sole master of the empire. He began his reign with the siege of Azof, then in the hands of the Turks, but did not take it until the following year. He had already sent for Venetians to build galleys, which might shut up the mouth of the river Don, and prevent the Turks from relieving the place. This gave him a stronger idea than ever of the importance and necessity of a naval force; yet he could have none but foreign ships, none, at least, except those which he would be obliged to employ foreigners in building. He was desirous of surmounting these disadvantages, but the affairs he projected were of too new and singular a nature to be so much as considered in his council; indeed, they were not proper to be communicated.

He resolved, therefore, to manage the bold undertaking himself. With this in view, he, in 1697, sent an embassy to Holland, and went himself *incognito* in the retinue. Entering the India admiralty office at Amsterdam, he enrolled in the list of ship carpenters, and worked in the yard with greater assiduity than anybody there. His quality was known to all, and they pointed to him with a sort of veneration. King William, of England, who was then in Holland, paid him all the respect that was due to his uncommon qualities; and the czar's disguise freed him from that which was merely ceremonious and troublesome. He worked with such success that in a short time he passed for a good carpenter, and afterward studied the proportions of a ship.

From Holland Peter went to England, where, in four months, he made himself a complete master in the art of shipbuilding by studying the principles of it mathematically, which he had no opportunity of learning in Holland. In England he was accorded a second reception by King William, who, to make him a gift agreeable to his taste, and which might at the same time serve as a model of the art he was so very desirous to learn, had previously given him a magnificent yacht.

On leaving England he took with him a number of English shipbuilders and artificers, among whom was one Noy, one of the most celebrated ship craftsmen of his time. Peter took upon himself the title of a master-builder, but was pleased to submit to the superior knowledge of others. Consequently the czar and Noy received orders from the lord high admiral of Russia, to build each of them a man-of-war; and, in compliance with that order, the czar gave the first proof of his art. He never ceased to pursue it, but had always a ship upon the stocks; and at his death left half built one of the largest ships in Europe.

During the czar's absence, the princess Sophia, uneasy under her confinement, was devising means to regain that liberty which she had forfeited by former insurrections. She found an opportunity to correspond with the strelitz, who were now quartered at some distance from Moscow, and to instigate them to a third rebellion in her favor. The news of this disturbance obliged Peter to hasten home, and, arriving at Moscow about the end of 1698, he executed terrible vengeance upon the ringleaders, and hanged the priest, who had carried his sister's letters, on a gallows before her window.

In the early part of 1700 he got together a body of standing forces, consisting of thirty thousand troops. And now the vast project which he had formed began to display itself in all parts. He first sent the chief nobility of his empire into foreign countries, to improve themselves in knowledge and learning; he opened his dominions, which until then had been shut up; he invited all strangers who were capable of instructing his subjects; and he gave the kindest reception to all land and sea officers, sailors, mathematicians, architects, miners, workers in metals, physicians, surgeons, and, indeed, operators and artificers of every kind, who would settle in his dominions. In the meantime he had to do with a dull, heavy, untoward people; hence it is little wonder that proceedings so new and strange should cause many uprisings and tumults. Many such took place; and it was sometimes as much as the czar could do to stifle and suppress them.

Peter was now desirous of gaining possession of Carelia and Ingria, provinces of Sweden, which had formerly belonged to Russia, and entered into an alliance with the kings of Poland and Denmark to make a combined attack on Sweden, taking advantage of the tender age of its monarch, Charles XII. He was shamefully defeated at Narva, his raw troops being wholly unable to cope with the Swedish veterans. But Peter was by no means disheartened. Taking advantage of the Swedish troops being employed elsewhere, he quietly appropriated a portion of Ingria, in which he laid the foundation of the new capital, St. Petersburg, May 27, 1703. Great inducements were then held out to those who would reside in it, and in a few years it became the Russian commercial depot for the Baltic.

In the long contest with Sweden, the Russians were almost always defeated; but Peter rather rejoiced at this, as he saw that these reverses were administering to his troops a more lasting and effective discipline than he could have hoped to give them in any other way. He had his revenge at last, in totally routing the Swedish king, Charles XII., at Pultowa in July, 1709, and in seizing the whole of the Baltic provinces and a portion of Finland in the following year. His success against Sweden helped much to consolidate his empire, and to render his subjects more favorably disposed toward the new order of things.

After reorganizing his army he prepared for strife with the Turks, who at the instigation of Charles XII.— then residing at Bender — had declared war against him. In this contest Peter was reduced to such straits that he despaired of escape, and, looking forward to death or captivity, wrote a letter to his chief nobles, cautioning them against obeying any orders he might give them while a captive, and advising them regarding a successor to the throne in case of his death. But the finesse and ability of Catharine Alexievna, afterward his wife and successor, extricated him from his difficulties; and a treaty was concluded in 1711, by which Peter lost only his previous conquest — the port of Azof and the territory belonging to it. Shut out from the Black sea, the possession of a good seaboard on the Baltic became the more necessary to him, and the war against Sweden in Pomerania was accordingly pushed on with the utmost vigor.

On March 2, 1712, his marriage with Catharine was celebrated at St. Petersburg; and two months afterward the offices of the central government were transferred to the new capital. His arms in Pomerania and

Finland were crowned with success, and in 1713 the latter province was completely subdued. Neither did Peter neglect any opportunity to develop the naval power of the empire; and the strictness with which he enforced the discharge of their duties on his ministers and officers appears from the refusal by the court of admiralty of the czar's own application for the grade of vice-admiral, until by defeating the Swedish fleet at Hangöudd, and taking the Aland isles, and several coast forts in Finland, he had merited the honor.

All this time his pursuits after all kinds of knowledge were unceasingly continued. He caused his engineers to draw plans for cities, and to make designs of the different machines which he did not have in his own country. He instructed himself in husbandry, and in all sorts of trade, wherever he went. He paid a visit with his consort to the king of Denmark at Copenhagen, where he spent three months. He visited there every school of the university, and all the men of letters; for, regardless of ceremony and pageantry, which he hated, it was indifferent to him whether they waited on him or he went to them. He coasted the kingdoms of Denmark and Sweden, attended by two engineers; surveyed the windings, sounded the straits, and afterward had the whole so exactly described in charts that not so much as the smallest shelf or bank of sand escaped his observation. From Copenhagen he went to Hamburg, Hanover, Wolfenbüttel, and from thence to Holland. During the years 1716 and 1717, in company with the czarina, he made another tour of Europe, this time visiting the city of Paris, where he was received with great attention. He returned to Russia in October, 1717, carrying with him books, paintings, statues, and other evidences of culture and art.

In 1722 Peter commenced a war with Persia, in order to open up the Caspian sea to Russian commerce. The internal troubles of Persia compelled the shah to yield to the demands of his formidable opponent, and to give up the three Caspian provinces along with the towns of Derbend and Baku. On Peter's return to his capital, he inquired into the conduct of his finance ministers, and punished with fines, imprisonment, and even death those whom he detected in fraudulent acts. To save the empire which he had established and constituted from being abandoned to the weak government of a minor, he promulgated in February, 1722, his celebrated law of succession.

During the latter years of his life he was engaged chiefly in beautifying and improving his new capital, and carrying out plans for the more general diffusion of knowledge and education among his subjects. In the autumn of 1724 he was seized with a serious illness; and, when all hope of recovery had fled, he appointed his wife, Catharine, his successor, and had her crowned a few months before his death, which occurred on February 8, 1725, in the fifty-third year of his age.

It would be a great task to enumerate all the various establishments for which the Russians are indebted to this great monarch. Fontenelle has recorded some of the principal ones, and they must also have a place here. His first accomplishments were military. He established a body of one hundred thousand troops, under as regular a discipline as any in Europe; and a navy of forty ships of the line, and two hundred galleys. He fortified all the chief cities, which had been as dangerous in the night as the most unfrequented deserts, and installed an effective government therein. Then he built an academy for naval affairs and navigation, where all the nobility were obliged to send some of their children. He also built colleges at Moscow, Petersburg, and Kiev, for languages, polite literature, and mathematics; schools in the villages, where the children of the peasants were taught to read and write; a college of physicians, and a noble dispensary at Moscow, which furnished medicines to the great cities, and to the armies; whereas before, there was no physician but the czar's, and no apothecary in all his dominions.

Voltaire relates that the czar had studied this branch of knowledge under the celebrated Ruysch at Amsterdam, and made such progress under this master as to enable him to perform minor surgical operations himself. He afterward purchased the cabinet of that anatomist, which contained an immense collection of the most curious, instructive, and uncommon preparations.

In addition to the foregoing he established an observatory, not only for the use of astronomers, but as a repository for natural curiosities; a botanical garden stocked with plants, not only from all parts of Europe, but from Asia, Persia, and even the distant parts of China; printing houses, where the old barbarous characters were abolished, which, through the great number of abbreviations, were almost unintelligible; interpreters for all the languages of Europe, and likewise for the Latin, Greek, Turkish, Calmuck, Mogul, and Chinese; and a royal library, composed of three very large subsidiary ones, which the czar purchased in England, Holstein, and Germany.

These and many more were particular institutions and establishments; but the czar made many general reformations, to which, indeed, the others were only subservient. He changed the architecture, which was ugly and deformed; or, to speak more properly, he first introduced that science into his dominion. He sent for a great number of pictures from Italy and France, and by this means instructed in the art of painting a people, who knew no more of it than what they could collect from the wretched daubing of their painters of saints. He sent ships laden with merchandise to Genoa and Leghorn, which returned freighted with marble and statues; and Pope Clement XI., pleased with his taste, presented him with a fine antique, which the czar, not caring to trust by sea, ordered to be brought to St. Petersburg by land.

Religion was not neglected in this general reform; ignorance and superstition had overrun it so much that it scarcely merited the name of Christian. The czar introduced knowledge where it was urgently needed, and this knowledge enabled him to abolish fasts, miracles, and saint-worship, in a good degree, at least. But he ventured further than the mere correction of rites; and by this means got rid of a power which was always interrupting and disconcerting his measures. He took away part of the revenues of those churches and monasteries which he thought too wealthy; and, leaving only what was necessary for their subsistence, added the surplus to his own demesnes. He made many judicious and useful ecclesiastical canons, and ordered preaching in the Russian language.

Lastly, he established a general liberty of conscience throughout his dominions; and if we had no other proof of his civilized spirit, this would be sufficient. There is one more reformation, perhaps as necessary and useful as any of the former, which he made even in his last illness, though it was exceedingly painful. When the senators and great personages, then about him, mentioned the various obligations which Russia lay under to him, for abolishing ignorance and barbarism, and introducing arts and sciences, he told them that he had forgotten to reform one of the most important points of all; namely, the administration of justice, occasioned by the tedious and litigious chicanery of the lawyers; and he signed an order from his bed limiting the determination of all causes to eleven days, which was immediately sent to all the courts of his empire.

He had a son who lived to be a man; but this son engaged with his mother, whom Peter had divorced, and other malcontents in a conspiracy against his father in 1717, and was condemned to die. He saved the executioners the trouble, however, by dying a natural death. An account of this unfortunate prince, with original papers, was published by the czar himself, the title of which, as it stands in the second volume of the "Present State of Russia," translated from the High Dutch, runs thus: "A manifesto of the Criminal Process of the Czarwitz Alexei Petrowitz, judged and published at St. Petersburg, the 25th of June, 1718, translated from the Russian original, and printed by the order of his czarish majesty at The Hague, 1718."

The czar also composed several works upon naval affairs; and his name must be added to the short catalogue of sovereigns who have honored the public with their writings.

The personal appearance of Peter was imposing. He was tall and robust, active, nimble of foot, quick and impatient in his gestures, and rapid in all his movements. His face was plump and round, his hair brown and curly. His features were regular; but their general expression was severe, and at times even ferocious. He was lively and sociable, however, in his manners, and very accessible. He possessed a sound judgment which, as Voltaire has observed, may justly be deemed the foundation of all real abilities; and to this solidity was joined an active disposition, which instigated him to the most arduous undertakings. Whoever reflects upon the interruptions, difficulties, and oppositions, that must unavoidably occur in civilizing and reforming a large and barbarous empire, must suppose the czar to have been, as indeed he really was, a person of the greatest firmness and perseverance. He was undoubtedly a man of powerful and original genius, and rendered services of inestimable value to his ignorant and barbarous subjects.

But great vices as well as great virtues were combined in his character. At one time he exhibited the most marked benevolence and humanity, at another a total disregard of human life. He was at once kind-hearted and cruel, and often gave way to violent passions and indulged in the grossest sensualities — the fruits, in part at least, of the barbarism of his country and his own imperfect education, which was far from being worthy of his genius; it had been spoiled by the princess Sophia, whose interest it was that he should be immersed in licentious excesses. However, in spite of bad example, and even his own strong propensity to pleasure, his natural desire of knowledge and magnanimity of soul broke through all habits, nay, they broke through something even greater than habits. "He gave a polish," says Voltaire, "to his people, and was himself a savage; he taught them the art of war, of which he was himself ignorant; from the sight of a small boat on the river Moskwa, he erected a powerful fleet; made himself an expert shipwright, sailor, pilot, and commander; he changed the manners, customs, and laws of the Russians, and lives in their memory as the father of his country."

Perhaps Peter has never been more truthfully characterized than by one of his greatest biographers, Waliszewski. "Peter," this writer says, "is Russia — her flesh and blood, her temperament and genius, her virtues and her vices. With his various aptitudes, his multiplicity of effort, his tumultuous passions, he rises up before us, a collective being. This makes his greatness. This raises him far above the pale shadows which our feeble historical evocation strives to snatch out of oblivion. There is no need to call his figure up. He stands before us, surviving his own existence, perpetuating himself — a continual actual fact."

FRANKLIN

A. D.		AGE
1706	Born at Boston, Massachusetts,	..
1717	Apprentice in printing office,	11
1723	Settled in Philadelphia,	17
1724	Went to England,	18
1730	Married at Philadelphia,	24
1732–57	Published *Poor Richard's Almanac,*	26–51
1743	Proposed establishing academy—afterward university of Pennsylvania,	37
1746	Began experiments in electricity,	40
1752	Discovered identity of electricity and lightning,	46
1753	Deputy postmaster-general,	47
1757–62	Envoy to England,	51–56
1764–75	Again envoy to England,	58–69
1776	Signed declaration of independence,	70
1776–85	Ambassador to France,	70–79
1785	Governor of Pennsylvania,	79
1787	Delegate to constitutional convention,	81
1788	Retired from active public life,	82
1790	Died at Philadelphia, Pa.,	84

BENJAMIN FRANKLIN, celebrated as statesman, diplomatist, author, and philosopher, was born at Boston, Massachusetts, January 17, 1706, where his father, an English non-conformist, had settled twenty-five years before. He was the youngest son of a family of seventeen children, and at an early age showed such a fondness for books that it was determined to educate him for the ministry. After two years at school, however, he was obliged to leave and assist his father, who with his trade of dyer combined that of tallow chandler and soap boiler. Benjamin, though disliking this kind of occupation, worked at it two years, and in his twelfth year thought himself decidedly fortunate in being apprenticed to his brother, a printer, a business which promised to afford better opportunities to get at books, his one special desire.

Still he was more and more puzzled how to gratify his love of knowledge. One day he hit upon an expedient that brought in a little cash. By reading a vegetarian book, the Yankee lad had been led to think that people could live better without meat than with it, and that killing innocent animals for food was cruel and wicked. So he abstained from meat altogether for about two years. As this led to some inconvenience at his boarding house, he made this cunning proposition to his master: "Give me one-half the money you pay for my board, and I will board myself." The master consenting, the apprentice lived entirely upon such things as hominy, bread, rice, and potatoes, and found that he could actually live upon half of the half.

The money he thus was able to save he expended in the improvement of his mind. Among all the books he had read, voyages and history charmed him most; but he tells us in his autobiography that the two works which exercised the greatest influence on his career were the *Lives* of Plutarch and the *Essay on Projects* by Defoe, the author of *Robinson Crusoe,* which he read about this time.

In the business of printing he soon became an expert, read with avidity all the books that came within his reach, and tried his hand at verse-making. But, falling in with some old volumes of the *Spectator,* he became more interested in forming his prose style on the model of its articles, and, as he says, was thus prevented from becoming a bad poet. At the age of sixteen he had read Locke's treatise *On the Understanding,* the Port-Royal *Art of Thinking,* and Xenophon's *Memoirs of Socrates.* Every new faculty which in turn developed itself in him was almost always worked to extremes as the result of having no guide to direct its development. The study of metaphysics made him sceptical, and to defend his new principles he adopted the Socratic method of reasoning, in which he became an adept.

About this time his relations with his brother became unpleasant. Franklin was evidently too studious and ambitious. Original articles written by him were accepted for publication in his brother's paper, the editor not knowing their source. The brother became jealous, and, although his indentures were not out, Franklin determined to leave him and start in the world for himself. He consequently sold some of his books and quietly left Boston in October, 1723. He went to New York, but finding no work there set out for Philadelphia. When at the age of seventeen he landed at Philadelphia, a runaway apprentice, he had one silver dollar and one shilling in copper coin. He asked the boatmen, upon whose boat he had come down the Delaware, how much he had to pay. They answered that it would be nothing, because he had helped them row. Franklin, however, insisted upon their taking his shilling's worth of coppers, and forced the money upon them.

An hour after, having bought three rolls for his breakfast, he ate one, and gave the other two to a poor woman and her child, who had been his fellow passengers. These were small things, you may say; but remember, he was a poor, ragged runaway in a strange town, four hundred miles from a friend, with three pence gone out of the only dollar he had in the world.

Franklin soon found employment with a printer, named Keimer, a Jew, to whom he rendered himself invaluable by his skill, energy, and fruitful resources for obtaining orders. He received flattering attentions from some of the prominent citizens in Philadelphia, and attracted the notice of Sir William Keith, the governor of the province, who greatly patronized him, and proposed to set him up in business for himself.

Franklin embarked for London in 1724 to buy the necessary type. On arriving there he found he had relied too confidently on promises which could not be fulfilled, and must depend on his own exertions to gain even his daily bread. He found employment at a famous printing house — Palmer's — and afterward at another. He made friends among his fellow workmen, set them an excellent example of temperance and good work, and astonished them by his feats of swimming. He wrote at this time some essays — the *Dissertation on Liberty, Necessity, Pleasure and Pain* — which were printed and circulated.

After spending about eighteen months in London, a Mr. Denham, whom he had met, informed him that he was going to return to Philadelphia to open a store, and offered him a situation as clerk, at a salary of fifty pounds. The money was less than he was now making as a compositor, but he longed to see his native country again, and accepted the proposal. Accordingly the two set sail together, and after a long voyage arrived in Philadelphia in October, 1726.

A few months after their arrival, Denham died, and Franklin was once more left on the world. He then engaged again with his master, Keimer, the printer, with whom he remained but a short time. Shortly afterward he joined one of his fellow workmen, named Meredith, and began business with him, type having been procured from England. He now established a newspaper, the Pennsylvania *Gazette,* which met with great success, and the observations which he wrote for its columns on colonial subjects obtained for him many friends in the house of assembly, so that he and his partner were appointed printers to the house.

Meredith's father having subsequently failed to advance the capital which had been agreed upon, Meredith proposed to Franklin to relinquish the partnership, and leave the whole in Franklin's hands, if he would take upon him the debts of the concern, return to his father what he had advanced on their commencing business, pay Meredith's little personal debts, and give him thirty pounds and a new saddle.

By the kindness of two friends, who, unknown to each other, came forward unasked to tender their assistance, Franklin was enabled to accept this proposal; and thus, about the year 1729, when he was only in his twenty-fourth year, he found himself, after all his disappointments and vicissitudes, with nothing, indeed, to depend upon but his skill and industry for gaining a livelihood, and for extricating himself from debt. Still he was, in one sense, fairly established in life, and with at least a bright prospect before him. In the following year he married Miss Deborah Read, daughter of the man with whom he had lodged on his first arrival at Philadelphia.

His subsequent efforts in pursuit of fortune and independence were eminently successful. The first circulating library in America was established by him. A publication, in recommendation of a paper currency, obtained for him at the time much popularity. In 1732 he first published his celebrated almanac, under the name of *Richard Saunders*, but which was commonly known by the name of *Poor Richard's Almanac*. He continued this publication annually for twenty-five years. The proverbs and pithy sentences scattered throughout its various numbers were afterward thrown together in a connected discourse, under the title of *The Way to Wealth*. This publication at once became one of wide popularity, and probably there are but few literally educated persons who are not familiar with it. It has also been translated into many foreign languages.

Franklin says that in 1733 he began to study languages, and soon became familiar with French, Italian, Spanish, and Latin. In 1736 he was chosen clerk of the general assembly of Pennsylvania, and in the following year became postmaster of Philadelphia. These preferments induced him to give much thought to statecraft, and to take a more active part in public affairs than he had hitherto done.

He first turned his attention to the condition of the city police, which was then in a shameful condition, and he soon effected a reformation in the whole system. He afterward suggested and promoted the establishment of a fire company, the first projected in America; he also organized a militia for the defense of the province. In 1743 he proposed establishing an academy for the education of youth, which became the germ of the great university of Pennsylvania. In short, every department of the civil government, as he tells us, and almost at the same time, imposed some duty upon him. "The governor," he says, "put me into the commission of the peace; the corporation of the city chose me one of the common council; and the citizens at large elected me a burgess to represent them in assembly."

Notwithstanding the multiplicity of his public duties, he found leisure to pursue his familiar scientific investigations in electricity, which he began in 1746. These were attended with such success as to gain for him a lasting name in the world of science. In 1752 he discovered the identity of electricity and lightning, and turned the discovery to account by publishing a plan for defending houses from lightning by the use of pointed conductors. He likewise made important discoveries with regard to the laws that regulate the electric fluid, a subject hitherto very imperfectly understood. His renown had spread over the whole civilized world, and honors were heaped upon him by the various learned societies of Europe. The Godfrey Copley gold medal was bestowed upon him by the royal society of London, which also nominated him one of its members. The universities of Oxford, St. Andrews, and Edinburgh, respectively, conferred upon him the doctorate of laws. He was made an associate of the academy of sciences at Paris, as Leibnitz and Newton had been before him.

In 1753 Franklin was made deputy postmaster-general for the British colonies in America, and in the same year he projected and established the academy of sciences in Philadelphia. In 1754 he was one of the colonial delegates who met in congress at Albany to devise means of defense against the French; and there he submitted a plan of union, similar in many respects to our federal constitution, but it was rejected by the British government and the colonial assemblies for widely different reasons.

Three years afterward Franklin was sent to England as the agent for Pennsylvania, and was employed in the same capacity by three other colonies. There he associated with the greatest men of the time, and the poor journeyman printer of a few years before "stood before kings," and was honored by men of learning.

He returned to America in 1762, and took his seat in the colonial assembly; but two years afterward, the dispute between the colonies and the government having commenced in earnest, he was again sent as an agent for Pennsylvania to England. He remained abroad until 1775, during which time he visited the continent, and became acquainted with the most learned men in Europe. On the day of his arrival in America, he was elected a member of the continental congress; and he was one of the signers of the declaration of independence the following year.

During the whole period of the revolution he was continually active in a civil capacity at home or abroad. No man did more for the establishment of American independence than Franklin. Congress sent him as a commissioner to the French court in 1776. At the time the ocean swarmed with British cruisers, General Washington had lost New York, and the prospects of the revolution were gloomy in the extreme.

Franklin was an old man of seventy, and might justly have asked to be excused from a service so perilous and fatiguing. But he did not. He went. And, just before he sailed, he got together all the money he could raise — about three thousand pounds — and invested it in the loan recently announced by congress. This he did at a moment when few men had a hearty faith in the success of the revolution. This he did when he was going to a foreign country that might not receive him, from which he might be expelled, and he have no country to which to return. There never was a more gallant and generous act done by an old man.

In France he was as much the mainstay of the cause of his country as General Washington was at home. He was one of the most accomplished and adroit diplomats at Versailles, where he was received with extraordinary enthusiasm both as a *savant* and as a patriot. While in Paris he wrote much for the press, and "kept the world constantly talking of him, and wondering at the inexhaustible variety and unconventional novelty of his resources." His meeting with Voltaire at the academy of sciences, where the two illustrious old men publicly embraced each other, is really a great historic scene; and everyone knows the epigram of Turgot — "He wrested from heaven its thunderbolt and from tyrants their sceptre." But it was not until 1778 that he induced the French government to form the alliance with the revolted colonies which eventually compelled England to concede their independence.

In 1783 the definite treaty of peace was signed; and in 1785 Franklin solicited permission to return home, which was granted. His reception in Philadelphia, where sixty-two years before he had landed a penniless, runaway apprentice of seventeen, almost exceeded the bounds of enthusiasm. The appreciation of a grateful people was still further expressed when a month later he was elected governor of Pennsylvania for three successive years, at a salary of two thousand pounds a year. But by this time he had become convinced that offices of honor, such as the governorship of a state, ought not to have any salary attached to them. He thought they should be filled by persons of independent income, willing to serve their fellow citizens from benevolence, or for the honor of it. So thinking, at first, he determined not to receive any salary; but this being objected to, he devoted the whole of the salary for three years — six thousand pounds — to the furtherance of public objects. Part of it he gave to a college, and part was set aside for the improvement of the Schuylkill river.

In 1787 he was a delegate to the federal constitutional convention, and in 1788 he retired from active public life, using his pen, however, as vigorously as ever. His last act — and it was one in beautiful accordance with the whole tenor of his life — was putting his signature as president of the antislavery society to a memorial presented to the house of representatives, praying them to exert the full powers intrusted to them to discourage the revolting traffic in human lives.

On April 17, 1790, in his eighty-fifth year, he died in Philadelphia. He was interred in the burial ground of Christ church, Philadelphia, and numerous statues have been erected to his memory throughout the country. The following epitaph was written by Franklin many years previous to his death, but was never inscribed on his tombstone:

"The body of Benjamin Franklin, Printer, — like the cover of an old book; its contents torn out, and stript of its lettering and gilding — lies here food for worms; yet the work itself shall not be lost; for it will, as he believed, appear once more in a new and more beautiful edition, corrected and amended by the Author."

In person, Franklin was about five feet nine or ten inches in height, and well and strongly made. He had a fair complexion and grey eyes; his manners were extremely winning and affable. None of his descendants bear his name, the last who did so being his grandson, William Temple Franklin, who died in 1823. There are many descendants of his daughter, who married a Mr. Bache.

No man of the age stood on a prouder eminence than this extraordinary commoner, who had originally been one of the most obscure of people, and had raised himself to all this distinction almost without the aid of any education except such as he had acquired himself. Who will say, after reading his story, that anything more is necessary for the attainment of knowledge, than the determination to attain it? The secret of Franklin's success in the cultivation of his mental powers was that he was ever awake and active; that he suffered no opportunity of forwarding it to escape him unimproved; that, however poor, he found at least a few pence, were it even by diminishing his scanty meals, to pay for the loan of the books he could not buy; that however hard he worked, he found a few hours in the week to read and study them. Others may not have his presence of mind; but his industry, his perseverance, his self-command, are for the imitation of all mankind.

"America," says Bigelow, "owes much to him for his services in various public capacities; the world owes much to the fruits of his pen; but his greatest contribution to the welfare of mankind, probably, was what he did by his example and life to dignify manual labor."

Never was an eminent man more thoughtful of the lowly people who were the companions of his poverty. Franklin, from the midst of the splendors of the French court, and when he was the most famous and admired person in Europe, forgot not his poor old sister, Jane, who was, in part, dependent upon his bounty. He gave her a house in Boston, and sent her, every September, the money to lay in her winter's fuel and provisions. He wrote her the kindest, wittiest, pleasantest letters. "Believe me, dear brother," she writes, "your writing to me gives me so much pleasure, that the great, the very great presents you have sent me give me but a secondary joy."

"Franklin is, indeed," says Lecky, "one of the very small class of men who can be said to have added something of real value to the art of living."

Upon receiving a letter once from a friend, who apologized for his bad spelling, Franklin, in replying to it, comforts him in the following humorous manner:

"You need not be concerned in writing to me about your bad spelling; for in my opinion, what is called bad spelling is generally the best, as conforming to the sound of the letters. To give you an instance, a gentleman received a letter in which were these words: 'Not finding Brown at *hom* I delivered your *messeg* to his *yf*.' The gentleman called his wife to help him to read it. Between them they picked out all but the *yf*, which they could not understand. The lady proposed calling her chamber-maid, 'because Betty,' says she, 'has the best knack of reading bad spelling of any one I know.' Betty came, and was surprised that neither of them could tell what *yf* was. 'Why,' she replied, '*yf* spells wife — what else can it spell?' And, indeed, it is a much better, as well as shorter method than doubleyou, i, f, e, which, in reality, spells doublewife."

Franklin left an interesting and highly instructive autobiography of the earlier part of his life, a continuation of which has been added by Jared Sparks, prefixed to an edition of Franklin's entire works, in ten volumes, and more recently edited by John Bigelow.

He was never deliberately an author. All his writing was done with a practical aim, and derives its value largely from the accuracy with which it reflects his character. He was quite deficient in poetic imagination and in ability to appreciate the spiritual side of human nature. His newspaper and his *Almanac* were the organs through which he spread his views on practical morality and his wisdom, while his numerous letters reflect his distinctive humor. His greatest service was undoubtedly due to his skill in diplomacy.

The great French orator, Mirabeau, once said: "Antiquity would have raised altars to this mighty genius, who, to the advantage of mankind, compassing in his mind the heavens and the earth, was able to restrain alike thunderbolts and tyrants."

FREDERICK THE GREAT

A. D.		AGE
1712	Born at Berlin, Prussia,	..
1730	Attempted to leave Prussia,	18
1733	Married,	21
1740	Became king,	28
1740–42	War with Austria; treaty of Breslau,	28–30
1744	Invaded Bohemia,	32
1745	Treaty of Dresden,	33
1750	Induces Voltaire to reside at Potsdam,	38
1756	Began seven years' war,	44
1763	Signed peace of Hubertsburg,	51
1772	Participated in partition of Poland,	60
1778	Prevented partition of Bavaria,	66
1785	Formed the Fürstenbund,	73
1786	Died at Sans Souci, near Potsdam,	74

FREDERICK THE GREAT, otherwise FREDERICK II., of Prussia, one of the most celebrated of German sovereigns, born January 24, 1712, at Berlin, was the son of Frederick William I. and the princess Sophia Dorothea, daughter of George I., of Great Britain. He was very little indebted for his personal greatness to the virtues or example of his immediate progenitors.

His grandfather, Frederick I., the first of the house of Brandenburg who assumed the title of king, was a weak and empty prince, whose character was taken by his own wife to exemplify the idea of infinite littleness. His father, Frederick William, was a man of a violent and brutal disposition, eccentric and intemperate, whose principal and almost sole pleasure and pursuit was the training and daily superintendence of an army disproportionately greater than the extent of his dominions seemed to warrant. It is, however, to the credit of Frederick William as a ruler, that, notwithstanding this expensive taste, his finances on the whole were well and economically administered; so that on his death he left a quiet and happy, though not wealthy, country, a treasure of nine millions of crowns, amounting to more than a year's revenue, and a well-disciplined army of seventy-six thousand men. Thus on his accession, Frederick II. found ready prepared men and money, the instruments of war; and for this alone was he indebted to his father.

From Frederick William parental tenderness was not to be expected. His treatment of his whole family, wife and children, was brutal; but he showed a particular antipathy to his eldest son, from the age of fourteen upward, for which no reason can be assigned except that the young prince manifested a taste for literature, and preferred books and music to the routine of military exercises. From this age Frederick's life was embittered by continual contradiction, insult, and even personal violence. In 1730 he endeavored to escape by flight from his father's control; but this intention being revealed, he was arrested, tried as a deserter, and condemned to death by an obedient court-martial. The sentence, to all appearance, would have been carried into effect, had it not been for the interference of the emperor of Germany, Charles VI. of Austria. The king yielded to his urgent entreaties, but with much reluctance, saying, "Austria will some day perceive what a serpent she warms in her bosom."

In 1732 Frederick procured a remission of this ill treatment by contracting, against his will, a marriage with Elizabeth Christina, of Brunswick. The marriage took place in 1733. Domestic happiness he neither sought nor found; for it appears that he never lived with his wife. Her endowments, mental and personal, were not such as to win the affections of so fastidious a man, but her moral qualities and conduct are highly commended; and, except in the resolute avoidance of her society, her husband through life treated her with high esteem. From the time of his marriage to his accession, Frederick resided at Rheinsberg, a village some distance northeast of Berlin.

In 1734 Frederick made his first campaign with Prince Eugene, but without displaying, or finding opportunity to display, the military talents by which he was distinguished in after life. From 1732 to 1740 his time was principally devoted to literary amusements and society. Several of his published works were written during this period, among them the *Anti-Machiavel* and "Considerations on the Character of Charles XII." He also devoted some portion of his time to the study of military tactics. His favorite companions were chiefly Frenchmen; and for French manners, language, cookery, and philosophy, he displayed through life a very decided preference.

The early part of Frederick's life gave little promise of his future energy as a soldier and statesman. The flute, embroidered clothes, and the composition of indifferent French verses seemed to occupy the attention of the young dilettante. His accession to the throne, on May 31, 1740, called his dormant energies at once into action. Fully conscious of his immense duties and cares, he assumed the entire direction of government, charging himself with those minute and daily duties which princes generally commit to their ministers. To discharge the multiplicity of business which thus devolved on him, he laid down strict rules for the regulation of his time and employments, to which, except when on active service, he scrupulously adhered. He always wore the uniform of his guards; he bestowed but a few minutes on his dress, in respect to which he was careless, even to slovenliness.

Peaceful employments did not long satisfy his active mind. His father, content with the possession of a powerful army, had never used it as an instrument of conquest; but Frederick, in the first year of his reign, undertook to wrest from Austria the province of Silesia. It appears that he had some hereditary claim on that country, which, from its adjoining situation, was a most desirable acquisition to the Prussian dominions, and to the assertion of this claim he deemed the time in question favorable.

At the death of Charles VI. in October, 1740, the hereditary dominions of Austria developed on a young princess, afterward the celebrated Maria Theresa. Trusting to her weakness, Frederick at once marched an army into Silesia. The people, being chiefly Protestants, were not well disposed toward their Austrian rulers, and the greater part of the country, except the fortresses, fell without a battle into the king of Prussia's possession. In the following campaign, April 10, 1741, the battle of Mollwitz was fought, which requires mention, because in this engagement, the first in which he commanded, Frederick displayed neither the skill nor the courage which the whole of his subsequent life proved him really to possess. It was said that he took shelter in a windmill, and this gave rise to the sarcasm that at Mollwitz the king of Prussia had covered himself with glory and with flour.

The Prussians, however, remained masters of the field. In the autumn of the same year they advanced within two days' march of Vienna; it was in this extremity of distress that Maria Theresa made her celebrated and affecting appeal to the diet of Hungary. A train of reverses, summed up by the decisive battle of Czaslau, fought May 17, 1742, in which Frederick displayed both fine courage and good conduct, induced Austria to consent to the treaty of Breslau, concluded in the same summer, by which Silesia, with the exception of a small district, was ceded to Prussia, of which kingdom it has ever since continued to form a part.

But though Prussia for a time enjoyed peace, the state of European politics was far from settled, and Frederick's time was much occupied by foreign diplomacy, as well as by the internal improvements which always were the favorite objects of his solicitude. The rapid rise of Prussia was not regarded with indifference by other powers. The Austrian government was inveterately hostile, from offended pride, as well as from a sense of injury. Saxony took part with Austria. Russia, if not an open enemy, was always a suspicious and unfriendly neighbor; and George II. of England, the king of Prussia's uncle, both feared and disliked his nephew. Under these circumstances, upon the formation of the triple alliance made by Austria, England, and Sardinia, Frederick concluded a treaty with France and the elector of Bavaria, who had succeeded Charles VI. as emperor of Germany. Frederick anticipated the designs of Austria upon Silesia, by marching into Bohemia in August, 1744.

During two campaigns the war was continued to the advantage of the Prussians, who, under the command of Frederick in person, gained two signal victories with inferior numbers, at Hohenfriedberg and Soor. At the end of December, 1745, he found himself in possession of Dresden, the capital of Saxony, and in condition to dictate terms of peace to Austria and Saxony, by which Silesia was again recognized as part of the Prussian dominions.

Five years were thus spent in acquiring and maintaining possession of this important province. The next ten years of Frederick's life were passed in profound peace. During this period he applied himself diligently and successfully to the recruiting of his army, and to building up the resources of Prussia. His habits of life were singularly uniform. He resided chiefly at Potsdam, apportioning his time and his employment with methodical exactness; and, by this strict attention to method, he was enabled to exercise a minute superintendence over every branch of government without estranging himself from social pleasures, or abandoning his literary pursuits.

After the peace of Dresden in 1745, he commenced his *Histoire de mon Temps,* which, in addition to the history of his own wars in Silesia, contains a general account of European politics. About the same period he wrote his "Memoirs of the House of Brandenburg," the best of his historical works. He maintained an active correspondence with Voltaire, and others of the most distinguished men of Europe. He established, or rather restored, the academy of sciences of Berlin, and was eager to enroll eminent foreigners among its members, and to induce them to resort to his capital. The names of Voltaire, Euler, Maupertuis, La Grange, and others of less note testify to his success. But his avowed contempt for the German, and admiration of the French literature and language, in which all the transactions of the society were carried on, gave an exotic character to the institution, and crippled the national benefits which might have been expected to arise from it.

In 1750, after a considerable expenditure of flattery, Frederick induced Voltaire to take up his residence at Potsdam. From this step he anticipated much pleasure and advantage, and for a time everything appeared to proceed according to his wishes. The social suppers in which he loved to indulge after the labors of the day were enlivened by the poet's brilliant talents; and the poet's gratitude for the royal friendship and condescension was manifested in his assiduous correction of the royal writings. For a time each was delighted with the other; but the mutual regard which these two singular characters had conceived was soon dissipated upon closer acquaintance, and after many undignified quarrels they parted in the spring of 1753, in a manner discreditable to both.

In 1756 Frederick learned that a new coalition, including Russia and his former ally France, was forming against him. The united continental powers were determined to crush him. England was his only ally. Having detected their secret intrigues, he resolved to strike the first blow, and in August, 1756, he entered Saxony with seventy thousand men, and thus began the seven years' war. The Austrian general, Browne, was defeated at Lobositz, October 1st. The Saxon army under Rutowski surrendered soon after; all Saxony was speedily reduced, and her resources turned against the confederacy. At the great battle of Prague, May 6, 1757, the Prussians were victorious; but after the defeat at Kolin in June, the occupation of his territory by the French, Swedes, and Russians made Frederick's affairs seem so desperate that he became very despondent. Encouraged by his victory over the French at Rossbach in November, and a victory at Leuthen in December, he soon regained Breslau. In August, 1758, he defeated the Russians at Zorndorf, the bloodiest battle of the war. Defeated by Daun at Hochkirch in October, he went into winter quarters at Breslau.

The year 1759 saw the allies closing round Frederick; he was defeated at Kunersdorf, and Berlin was saved only by his miraculous energy. The fifth year saw Berlin in the hands of the Russians, while Frederick won great battles at Liegnitz in August, 1760, and at Torgau in November, the one over Laudon, and the other over Daun. The sixth year promised ill, but still he fought on. England deserted him on the death of George II.; but Russia, on the death of Elizabeth in 1762, withdrew from the coalition. France also declared future neutrality; the Austrians and Prussians stood alone against each other. The empress now gave way, and the peace of Hubertsburg, signed February 15, 1763, again left Frederick in possession of Silesia.

The brilliant military reputation which Frederick had acquired in this arduous contest did not tempt him to pursue the career of a conqueror. He had risked everything to maintain possession of Silesia; but, if his writings speak the real feelings of his mind, he was deeply sensible to the sufferings and evils which attended upon war. "The state of Prussia," he himself says, in the *Histoire de mon Temps,* "can only be compared to that of a man riddled with wounds, weakened by loss of blood, and ready to sink under the weight of his misfortunes. The nobility was exhausted, the commons ruined, numbers of villages were burned, the towns ruined. Civil order was lost in a total anarchy: in a word, the desolation was universal."

To cure these evils Frederick applied his earnest attention; by grants of money to those towns which had suffered most, by the commencement and continuation of various great works on public utility, by attention to agriculture, by draining marshes, and settling colonists in the barren, or ruined portions of his country, and by cherishing manufactures — though not always with a useful or judicious zeal — he succeeded in vitalizing the exhausted population and resources of Prussia. It was with a wonderful rapidity, because his military establishment was at the same time recruited and maintained at the enormous number, considering the size and wealth of the kingdom, of two hundred thousand men.

One of his measures deserves especial notice, the emancipation of the peasants from hereditary servitude. This great undertaking he commenced at an early period of his reign, by giving up his own seignorial rights over the serfs on the crown domains. He completed it in the year 1766 by an edict abolishing servitude throughout his dominions. He then commenced a gradual alteration in the fiscal system of Prussia, suggested in part by the celebrated Helvetius.

In the department of finance, though all his experiments did not succeed, he was very successful. He is said, in the course of his reign, to have raised the annual revenue to nearly double what it had been in his father's time, and that without increasing the pressure of the people; from his last biographer he has obtained the praise of having "arrived, as far as any sovereign ever did, at perfection in that part of finance, which consists in extracting as much as possible from the people, without overburdening or impoverishing them; and receiving into the royal coffers the sums so extracted, with the least possible deductions." In such cares and in his literary pursuits, among which we may especially mention his "History of the Seven Years' War," passed the time of Frederick for ten years.

In 1772 he engaged in the nefarious project for the first partition of Poland. Of the iniquity of that project it is not necessary to speak; the universal voice of Europe has condemned it. It does not seem, however, that the scheme originated with Frederick. On the contrary, it appears to have been conceived by Catherine II., of Russia, and matured in conversations with Prince Henry, the king of Prussia's brother, during a visit to St. Petersburg. By the treaty of partition, which was not finally arranged until 1776, Prussia gained a territory of no great extent, but of importance from its connecting Prussia proper with the electoral dominions of Brandenburg and Silesia, and giving a compactness to the kingdom, of which it stood greatly in need.

Frederick made some amends for his conduct in this matter, by the diligence with which he labored to improve his acquisition. In this, as in most circumstances of internal administration, he was very successful; and the country, ruined by war, misgovernment, and the brutal sloth of its inhabitants, soon assumed the aspect of cheerful industry.

The king of Prussia once more led an army into the field, when, on the death of the elector of Bavaria, childless, in 1777, Joseph II. of Austria conceived the plan of reannexing to his own crown, under the plea of various antiquated feudal rights, the greater part of the Bavarian territories. Stimulated quite as much by jealousy of Austria, as by a sense of the injustice of this act, Frederick stood out as the assertor of the liberties of Germany, and, proceeding with the utmost politeness from explanation to explanation, he marched an army into Bohemia in July, 1778. The war, however, which was terminated in the following spring, was one of maneuvers, and partial engagements, in which Frederick's skill in strategy shone with its usual luster, and success, on the whole, rested with the Prussians. By the terms of the treaty of Teschen, May, 1779, the Bavarian dominions were secured, nearly entire, to the rightful collateral heirs, whose several claims were settled, while certain minor stipulations were made in favor of Prussia.

In 1785 Frederick again found occasion to oppose Austria, in defense of the integrity of the Germanic constitution. The emperor Joseph, in prosecution of his designs on Bavaria, had formed a contract with the reigning elector to exchange the Austrian provinces in the Netherlands for the electorate. Dissenting from this arrangement, the heir to the succession intrusted the advocacy of his rights to Frederick, who lost no time in negotiating a confederation among the chief powers of Germany — known as the Fürstenbund, or Germanic league — to support the constitution of the empire, and the rights of its several princes. By this timely step Austria was compelled to forego the desired acquisition.

At this time Frederick's constitution had begun to weaken. He had long been a sufferer from gout, the natural consequence of indulgence in good eating and rich cookery, to which throughout his life he was addicted. Toward the end of the year he began to experience great difficulty in breathing. His complaints, aggravated by total neglect of medical advice, and an extravagant appetite, which he gratified by eating to excess of the most highly seasoned and unwholesome food, terminated in confirmed dropsy. During the latter months of his life he suffered grievously from a complication of disorders; through this period he displayed remarkable patience, and considerations for the feelings of those around him. No expression of suffering was allowed to pass his lips; up to the last day of his life he continued to discharge with punctuality those political duties which he had imposed upon himself in youth and strength. Strange to say, while he exhibited this extraordinary self-control in some respects, he would not abstain from the most extravagant excesses in diet, though they were almost always followed by a severe aggravation of his sufferings. Up to August 15, 1786, he continued, as usual, to receive and answer all communications, and to despatch the usual routine of civil and military business. On the following day he fell into a lethargy, from which he only partially recovered. He died in the course of the night at Sans Souci, on August 17, 1786, in the seventy-fifth year of his age, and the forty-seventh of his reign. At his death he bequeathed to his nephew and successor, Frederick William, about ten millions sterling, an army of two hundred thousand men, and a kingdom nearly double its former size.

Frederick was rather below the middle size, in youth inclined to stoutness, lean in old age, but of vigorous and active habits. An expression of keen intelligence lighted up his features, and his large, sparkling, grey eyes darted penetrating glances at every one who approached him. In his later years he is described by Carlyle as a singular little figure that "used to be seen sauntering on the terraces of Sans Souci for a short time in the afternoon. His body was worn and bent by age and toil. He wore a battered cocked hat, a faded blue coat with red facings, a yellow waistcoat soiled with snuff, and long military boots unblackened and unbrushed; and in his hand he swung about a stick, rough from the woods. Yet, in spite of all this, his countenance had a right royal air. His mouth was firm; his nose was prominent, and rather flung into the air under its old cocked hat; and his grey eye had the penetrating, steadfast look of one who had been born to command."

His conversation was lively and his manners pleasing, and, when he wished it, captivating. He was fond of literature and of literary society, but his own attainments were limited to belles-lettres and moral sciences. He knew almost nothing of the classics, or, indeed, of any foreign language except the French, to which he was so partial that it was constantly spoken at his table, and all his works, both in prose and verse, were composed in that tongue. He wrote an immense number of poor verses; even the best of his poetical effusions seldom rise above mediocrity. His prose works are greatly superior to his poetry, though probably few even of them would have survived apart from his character and position.

Frederick was never at rest. He was an active spirit, constantly moving about and touching the springs of government with his own hand. Until an advanced period of life, he always rose at four o'clock in the morning. A basket filled with letters, despatches, and reports of every kind was then placed before him. Patiently he opened and read them all, and marked emphatically on the back of each what answer he wanted to be given. When he was done, it was about eight o'clock; the adjutant general was admitted, and received his orders in a few words. Frederick then went out and reviewed his guards, prying into every particular of their accouterments and discipline. By the time he returned, his four secretaries had written out in an official form the answers to the letters and despatches. Snatching up some of them at random, he ran his eye over them; and woe to the writer if he hit upon any blunders!

In this manner he bustled about all day, meddling with agriculture, commerce, education, and everything connected with the welfare of his subjects. When evening came, he usually abandoned himself to literary pleasures. For that purpose he had allured to his court a company of authors; among others came the great Voltaire, already mentioned. He entertained them at supper, threw aside his dignity, and called upon them to forget that he was a king. Literature and religion were discussed, compliments were paid and jests were bandied. One of the liveliest and the wittiest was the king himself.

Frederick was essentially a just, if somewhat austere, man, and the administration of justice under his rule was pure, though he himself had his usual cynical distrust of his judges' integrity. The press enjoyed comparative freedom; and freedom of conscience

was promoted. Though Frederick was himself a voluminous writer on political, historical, and military subjects, he had no sympathy with the nascent German literature, a fact on which the latter is perhaps to be congratulated. The spirit of the century went faster than Frederick; had he lived he would not have understood the logical outcome of his philosophic doctrines in the French revolution.

His subjects long remembered him as "Father Fritz," and historians have generally regarded him as the founder of the Prussian monarchy.

WASHINGTON

A. D.		AGE
1732	Born in Westmoreland county, Virginia,	..
1751	Adjutant general in Virginia,	19
1755	Placed at the head of the Virginia forces,	23
1759	Married,	27
1774	Delegate to the continental congress, at Philadelphia,	42
1775	Appointed commander-in-chief of the continental army,	43
1781	Received surrender of Cornwallis at Yorktown,	49
1783	Resigned command of army,	51
1789	Elected first president of the United States,	57
1793	Reëlected president,	61
1796	Refused a third term,	64
1797	Retired from public affairs,	65
1799	Died at Mt. Vernon, Virginia,	67

GEORGE WASHINGTON, first president of the United States, and illustrious as a military commander, patriot, and statesman, was born in Westmoreland county, Virginia, February 22, 1732. He was the son of Augustine Washington, a planter, and Mary Ball, his second wife. His ancestors belonged to an old English family, and the name of Washington is traceable as far back as the thirteenth century.

About 1657 two brothers, John and Lawrence Washington, emigrated to Virginia, and settled near the confluence of Bridges creek and the Potomac river, in the county of Westmoreland. The brothers bought lands and became successful planters. Not long after, John Washington was employed in a military command against the Indians; and he rose to the rank of colonel. He married Anne Pope, by whom he had two sons, Lawrence and John, and a daughter. The elder son, Lawrence, married Mildred Warner, of Gloucester county, by whom he had three children, John, Augustine, and Mildred. Augustine, the second, was twice married. By his first wife he had four children, two of whom died in infancy. By his second wife, Mary Ball, he had six children, George, Betty, Samuel, John Augustine, Charles, and Mildred.

Each of the sons of Augustine Washington inherited from him a separate plantation. To the eldest, Lawrence, he bequeathed an estate near Hunting creek, afterward called Mount Vernon. The second son had for his part an estate in Westmoreland. To George were left the lands and mansion in Stafford county, on the Rappahannock river, where his father had died. All the children were left in a good condition of independence. Mrs. Washington, a woman of strong sense, prudence, and industry, had control of all the estates until their owners came of age. She performed the difficult task allotted to her with entire success — and the world should give her the same tribute of respect and veneration which has been awarded to the mothers of all truly great men.

The province of Virginia offered but scanty opportunities for education. Enough knowledge for a practical business life was the most that could be obtained. Reading, writing, arithmetic, and some other branches of mathematics were alone within the reach of Washington. It is said that he was a diligent student, but that his passion for active sports and military exercise was displayed at a very early age. He delighted in running, jumping, wrestling, tossing bars, and other feats of strength and agility.

Another tradition is preserved which is quite as probable, and is important as illustrating the growth of two of his greatest qualities. It is said that while at school his reputation for truth and judgment was so well established that his fellow pupils were accustomed to make him the arbiter of their disputes, and never failed to be satisfied with his decision.

Besides performing what was required of him in the usual routine of study, young

Washington compiled a system of maxims and regulations, and arranged them under the head of *Rules for Behavior in Company and Conversation.* His temper was ardent and his passion powerful. The great object of his little code was to teach himself perfect self-control, which, according to the passionate Burns, is "wisdom's root." In the conquest of himself, Washington perfectly succeeded, and throughout his career he retained absolute command of his propensities.

Washington left school in the autumn preceding his sixteenth birthday. The last two years had been devoted to the study of geometry, trigonometry, and surveying. During the last summer he was at school, he surveyed the fields and plantations around the schoolhouse, and, with great skill and precision, entered the measurements and calculations in his books. He seems to have possessed a natural bent for the exact sciences.

While he was at school, his eldest brother, Lawrence, seeing Washington's military inclination, procured a midshipman's warrant for him. Washington prepared with a buoyant spirit to enter the British navy; but the earnest persuasion of his mother induced him to abandon the project and continue at school. He afterward went to reside with his brother, Lawrence, at Mount Vernon. There he became acquainted with the Fairfax family from whom he obtained his first regular employment as a surveyor.

The eccentric Lord Fairfax had purchased immense tracts of wild lands in the rich valley of the Alleghany mountains. These were to be measured and divided into lots. The service was difficult and dangerous. The country swarmed with Indians, with whom peace was always a disagreeable truce, and the hardships of a wilderness were to be endured. Washington, accompanied by George Fairfax, surmounted all obstacles, and performed the service required with skill and accuracy. His reputation as a surveyor was established. The knowledge of the wilderness and its inhabitants which he acquired was of great use to him in subsequent surveying and military expeditions. Receiving a commission as public surveyor, he was engaged almost uninterruptedly in the business of that office during the following three years.

In 1751 Washington entered the military service. The frontiers were then threatened by the French and Indians, and as a precautionary measure it was resolved to put the militia in a condition for defense. The province was divided into districts, in each of which was placed an adjutant general, with the rank of major, whose duty it was to muster and maintain discipline among the militia. Washington received charge of one of these districts.

He now studied tactics, and entered upon his congenial service with zeal and alacrity. But the ill-health of his brother, Lawrence, called him away to Barbados, and it was four months before he returned to Virginia. Lawrence returned a few months later and died at Mount Vernon. Washington was left executor and his time and thoughts were occupied for several months with the business which thus devolved upon him. Yet the duties of his military office were not neglected. Governor Dinwiddie, in 1752, divided Virginia into four grand military departments, and Washington, much to his gratification, received the command in the northern department. This was a post of great responsibility; the fact that it was conferred upon so young a man proves that the governor had confidence in his talents and energy.

At the outbreak of the French and Indian war in 1753, Washington was the agent sent by Governor Dinwiddie to warn the French away from their new forts in western Pennsylvania. The command of the Virginia troops who began hostilities fell to him, and his vigorous defense of Fort Necessity immediately made him so prominent a figure that in 1755, at the age of twenty-three, he was commissioned commander-in-chief of all the Virginia forces.

He now served in Braddock's campaign, and in the final defeat showed for the first time that fiery energy which always lay hidden beneath his calm and unruffled exterior. He ranged the whole field on horseback, making himself the most conspicuous mark for Indian bullets, and, in spite of what he called the "dastardly behavior" of the regular troops, brought the little remnant of his Virginians out of action in fair order. In spite of this reckless exposure, he was one of the few unwounded officers. For a year or two his task was that of "defending a frontier of more than three hundred fifty miles with seven hundred men"; but in 1758 he had the pleasure of commanding the advance guard of the expedition which captured Fort Du Quesne and renamed it Fort Pitt.

The war in Virginia being then at an end, Washington resigned his post. In 1759 he married Mrs. Martha Custis, widow of Daniel Parke Custis, whose maiden name was Dandridge, and settled at Mount Vernon. By his marriage he added about one hundred thousand dollars to his fortune, which was already considerable. He then began the purchase of adjacent plantations until the Mount Vernon estate amounted finally to eight thousand acres.

Washington's life for the next twenty years was merely that of a typical Virginia planter, a consistent member of the established (Episcopal) church, a large slaveholder, a strict but considerate master, and a widely trusted man of affairs. His extraordinary escape in Braddock's defeat had led a colonial minister to declare in a sermon his belief that the young man had been preserved to be "the savior of his country." If there was any such impression, it soon died away, and Washington gave none of his associates reason to consider him an uncommonly endowed man.

Like others of the dominant caste in Virginia, he was repeatedly elected to the legislature, but he is not known to have made any set speeches in that body, or to have said anything beyond a statement of his opinion and the reasons for it. That he thought a great deal and took full advantage of his legislative experiences as a political education is shown by his letter of April 5, 1769, to his neighbor, George Mason, communicating the Philadelphia non-importation resolutions, which had just reached him. Without speech-making he took a prominent part in the struggles of his legislature against Governor Dunmore, and his position was always a radical one. He even opposed petitions to the king and parliament, on the ground that the question had been put by the ministry on the basis of right, not of expediency, that the ministry could not abandon the right and the colonists could not admit it, and that petitions must be, as they had been, rejected. In 1774 the Virginia convention, appointing seven of its members as delegates to the continental congress, named Washington as one of them; and with this appointment his national career began.

Washington's letters during his service in congress show that he was under no delusions as to the outcome of the taxation struggle, and that he expected war. His associates in congress recognized his military ability at once, and most of the details of work looking toward preparations for armed resistance were by common consent left to him. Even in the intervals of his congressional service he was occupied in urging on the formation, equipment, and training of Virginia troops, and it was generally understood that, in case of war, Virginia would expect him to act as her commander-in-chief.

History was not to be cheated in that fashion. The two most powerful colonies were Virginia and Massachusetts. War began in Massachusetts; New England troops poured in almost spontaneously; it was necessary to insure the support of the colonies to the southward; and the Virginia colonel who was at the head of all the military committees was just the man whom the New England delegates desired. When congress, after the fights at Lexington and Concord, resolved to put the colonies into a state of defense, the first practical step was the unanimous selection, on motion of John Adams of Massachusetts, of Washington as commander-in-chief of the armed forces of the united colonies.

Refusing any salary, he accepted the position, asking "every gentleman in the room," however, to remember his declaration that he did not believe himself to be equal to the command, and that he accepted it only as a duty made imperative by the unanimity of the call. He reiterated this belief in private letters, even to his wife; and there seems to be no doubt that, to the day of his death, he was the most determined skeptic as to his fitness for the positions to which he was called in succession. He was commissioned June 15, 1775, and reached Cambridge, Mass., July 2d, taking command of the levies there assembled for action against the British garrison of Boston.

The battle of Bunker Hill, however, had taken place before he could take command of the army, and Washington's work until the following spring was to bring about some semblance of military discipline, to obtain ammunition and military stores, to correspond with congress and the colonial governors, to guide military operations in the widely separated parts of a great continent, to create a military system and organization for a people who were entirely unaccustomed to such a thing and impatient under it, and to bend the course of events steadily toward driving the British out of Boston.

It is not easy to see how Washington survived the year 1775; the colonial poverty, the exasperating annoyances, the selfishness or stupidity which cropped out again and again from the most patriotic of his coadjutors, were enough to have broken down most men. They completed his training. If he was not a great man when he went to Cambridge, he was a general and a statesman in the best sense when he drove the British out of Boston in March, 1776. From that time until his death he was the foremost man of the continent.

The military operations of the remainder of the war are too well known to be rehearsed here. Washington's retreat through the Jerseys, the manner in which he turned and struck his pursuers at Trenton and Princeton, and then established himself at Morristown so as to make the way to Philadelphia impassable, the vigor with which he handled his army at Chad's Ford and Germantown, the persistence with which he held the strategic position of Valley Forge through the dreadful winter of 1777-78, in spite of the misery of his men, the clamors of the people, and the impotence of the fugitive congress — all went to show that the fiber of his public character had been hardened to its permanent quality. It was a serious addition to his burdens that the spirit which culminated in Benedict Arnold chose this moment to make its appearance.

Many of the American officers had been affronted by the close personal friendship which had sprung up between Lafayette and Washington, and by the diplomatic deference which the commander-in-chief felt compelled to show to other foreign officers. Some of the latter showed no gratitude. The name of one of them, Conway, an Irish soldier of fortune from the French service, is attached to what is called "Conway's cabal." He formed a scheme for replacing Washington in the command by Gates, who had just succeeded in forcing Burgoyne to surrender at Saratoga; and a number of officers and men in civil life were mixed up in it. The treaty of 1778 with France put an end to every such plan. It was a flat absurdity to expect foreign nations to deal with a second-rate man as commander-in-chief while Washington was in existence; Washington seems to have had no more trouble of this kind.

The prompt and vigorous pursuit of Clinton across the Jerseys toward New York, and the battle of Monmouth, in which the plan of battle was thwarted by Charles Lee, another of the foreign officers, closed the direct military record of Washington until the end of the war. The enemy confined their movements to other parts of the continent, and Washington did little more than watch their headquarters in New York city. It was more than appropriate, however, that he, who had been the mainspring of the war, and had borne far more than his share of its burdens and discouragements, should end it with his well-planned campaign of Yorktown, and the surrender of Cornwallis, in 1781. The war was then really over, but the commander-in-chief retained his commission until December 23, 1783, when he returned it to congress, then in session at Annapolis, Md., and again retired to Mount Vernon.

By this time the canonization of Washington had fairly begun. He occupied such a position in the American political system as no man can possibly hold again. He became a political element, quite apart from the Union, the states, or the people of either. In a country where communication was still slow and difficult, the general knowledge that Washington favored anything superseded argument and the necessity of information with very many men. The army at the end of the war was justly dissatisfied with its treatment. The officers were called to meet at Newburgh, New York, and it was the avowed purpose of the leaders of the movement that the army should march westward, appropriate vacant lands, leave congress to negotiate for peace without an army, and "mock at their calamity and laugh when their fear cometh." It was the less publicly avowed purpose to make their commander-in-chief king, if he could be persuaded to aid in establishing a monarchy.

Washington put a summary stop to the whole proceeding. Their letter to him detailed the weakness of a republican form of government as they had experienced it, their desire for a "mixed government," with him at its head, and their belief that "the title of king" would be objectionable to few and of material advantage to the country. His reply was peremptory and even angry. He stated in plain terms his abhorrence of the proposal; he was at a loss to conceive what part of his conduct could have encouraged their address; they could not have found "a person to whom their schemes were more disagreeable"; and he threatened them with exposure unless the affair was stopped at once. His influence, and that alone, secured the disbanding of the discontented army. This influence still remained as powerful after he had retired to Mount Vernon as before his resignation.

When the federal convention met at Philadelphia in May, 1787, to frame the present constitution, Washington was present as a delegate from Virginia, though much against his will; a unanimous vote soon made him its presiding officer. He took no part in the debates, however, beyond such suggestive hints as his proposal to amend a restriction of the standing army to five thousand men by forbidding any enemy to invade the United States with more than three thousand. He approved the constitution which was decided upon, believing, as he said, "that it was the best constitution which could be obtained at that epoch, and that this or a dissolution awaits our choice, and is the only alternative." All his great prestige was given to secure its ratification, and his influence was probably decisive.

When the constitution had been ratified and the time came to elect a president, in 1789, there was no more hesitation than if the country had been a theocracy. The office of president had been "cut to fit the measure of George Washington"; no one thought of any other person for it. The unanimous vote of the electors made him the first president of the United States; their unanimous vote reëlected him in 1793; and, even after he had positively refused a third term, two electors obstinately voted for him in 1797.

One can hardly follow the public events of his presidency without receiving the conviction that the sudden success of the new system was due mainly to the existence at that time of such a character as Washington. He held the two national parties apart, and prevented party contest until the new form of government had been firmly established. It seems hardly possible that the final result should have been balked, even if "blood and iron" had been necessary to bring it about. It would be unwise to attribute the quiet attainment of the result to the political sense of the American people alone, or to use it as a historical precedent for the voluntary assumption of such a risk again, without the advantage of such a political factor as Washington.

The unconscious drift of Washington's mind was toward the federal party; his letters to Lafayette and Henry in December, 1798, and January, 1799, are enough to make that evident. When the republican party was formed, about 1793, it could not have been expected that its leaders would long submit with patience to the continual interposition of Washington's name and influence between themselves and their opponents; but they maintained a calm exterior. Some of their followers were less discreet. The president's proclamation of neutrality between France and Great Britain excited them to anger; his support of Jay's treaty with Great Britain roused them to fury. Forged letters, purporting to show his desire to abandon the revolutionary struggle, were published; he was accused of drawing more than his salary; hints of the propriety of a guillotine for his benefit began to appear; some spoke of him as the "stepfather of his country."

The attacks embittered the close of his term of service; he declared, in a cabinet meeting in 1793 that "he had never repented but once having slipped the moment of resigning his office, and that was every moment since." Indeed, the most unpleasant portions of Jefferson's annals are those in which, with an air of psychological dissection, he details the storms of passion into which the president was hurried by the newspaper attacks upon him. These attacks, however, came from a very small fraction of the politicians; the people never wavered in their devotion to the president, and his election would have been unanimous in 1797, as in 1789 and 1793, if he had been willing to serve.

Washington retired from the presidency in 1797, and resumed the plantation life, which he most loved, the society of his family, and the care of his slaves. He had resolved some time before never to obtain another slave, and "wished from his soul" that his state could be persuaded to abolish slavery; "it might prevent much future mischief." He was too old, however, to attempt further innovations. In 1798 he was made commander-in-chief of the provisional army raised in expectation of open war with France, and was fretted almost beyond endurance by the quarrels of federalist politicians about the distribution of commissions. In the midst of his military preparations, on December 12, 1799, he was exposed in the saddle for several hours to cold and snow and was attacked with acute laryngitis, for which he was repeatedly and largely bled; but he sank rapidly, and died December 14th. His last words were characteristic. He said: "I die hard; but I am not afraid to go. I believed from my first attack that I should not survive it. My breath cannot last long." A little later he said: "I feel myself going. I thank you for your attentions; but I pray you to take no more trouble about me. Let me go off quietly. I cannot last long." After some instructions to his secretary about his burial, he became easier, felt his own pulse, and died without a struggle. His remains were laid in a private vault at Mount Vernon, where his tomb has been since converted into a veritable shrine for all patriotic and liberty-loving Americans.

The third of the series of resolutions introduced in the house of representatives five days after his death by John Marshall, and passed unanimously, states exactly, if a trifle rhetorically, the position of Washington in American history: "First in war, first in peace, and first in the hearts of his countrymen."

Washington was of imposing presence. He was six feet two inches in height, and weighed about two hundred twenty pounds. His hair was brown, eyes blue, head large, and arms strong. He was a bold and graceful rider and hunter, attentive to his personal appearance and dignity, gracious and gentle, though at times cold and reserved. Although childless, he was very happy with his wife and his adopted children — nephews and nieces. His best portraits are those by Stuart, and the statue by Houdon at Richmond.

Washington's manners were those of the old school of English gentlemen. Although mild and humane, he was stern in the performance of duty, and never upon such occasions yielded to softness or compassion. His speeches and official letters were simple and earnest, but wanting perhaps in that conciseness which marks vigor of thought. On his decease his worth was justly appreciated, and the sorrow at his loss was universal and sincere.

He was distinguished less by the brilliancy of his talents than by his moral goodness, sound judgment, and plain but excellent understanding. Of all the great men in history he was the most invariably judicious and evenly poised. His admirable use of those sterling, though homely, qualities has gained a rank for him among the greatest and best of men; and his name will be coexistent, as it was coeval, with that of the great republic of which, no less by his rare civil wisdom than by his eminent military talents, he may be considered the founder.

The virtues which distinguish him from all others, who have united the fame of statesman and captain, were twofold, and they are as great as they are rare. He refused power which his own merit had placed within his reach, constantly persisting in the preference of a republican to a monarchical form of government, as the most congenial to liberty when it is not incompatible with the habits of the people and the circumstances of society; he even declined to continue longer than his years seemed to permit at the head of the commonwealth which he had founded. This subjugation of all ambitious feelings to the paramount sense of duty is his first excellence; it is the sacrifice of his own aggrandizement to his country's freedom.

The next is like unto it — his constant love of peace when placed at the head of affairs. This was the sacrifice of the worthless glory, which ordinary men prize the most, to the tranquillity and happiness of mankind. Wherefore to all ages and in all climes, they who most love public virtue will hold in eternal remembrance the name of George Washington, never pronouncing it but with gratitude and awe, as designating a mortal removed above the ordinary lot of human frailty.

The words of his last will in bequeathing his sword to his nephews — the sword which he had worn in the sacred war of liberty — ought to be graven in letters of gold over every palace in the world: "This sword they shall never draw but in defense of freedom, or of their country, or of their kindred; and when thus drawn, they shall prefer falling with it in their hands to the relinquishment thereof."

Gladstone declared that Washington "is the purest figure in history." Lecky found in him "a leader who could be induced by no earthly motive to tell a falsehood, or to break an engagement, or to commit any dishonorable act." Lord Brougham characterized him as "the greatest man that ever lived in this world uninspired by divine wisdom and unsustained by supernatural virtue."

JEFFERSON

1782	Plenipotentiary to England,	39	1826	Died at Monticello, Virginia,	83

THOMAS JEFFERSON, one of the most illustrious of American statesmen, and third president of the United States, was born at Shadwell, Albemarle county, Virginia, on April 13, 1743. Peter Jefferson, his father, was a man of some distinction in the colony, and his mother, Jane Randolph, was descended from an English family of good station. His father died in 1757, leaving a widow and eight children — Thomas being the eldest son. The children were all left in fair circumstances — Thomas receiving the lands which he called Monticello, and on which he afterward resided, when not engaged in public duties.

At the age of five he was sent to an elementary school; four years afterward he commenced the study of Latin, Greek, and French. In the spring of 1760 he entered an advanced class at William and Mary college, at Williamsburg, Virginia, where he prosecuted his studies for two years and was graduated. He there acquired the friendship of the professor of mathematics, Dr. William Small, who introduced him to George Wythe, under whose instruction he commenced the study of the law. In 1767, when twenty-four years old, Jefferson was admitted to the bar.

He continued the practice of law until the revolution closed the courts of justice. Several written arguments upon intricate law questions have been preserved, which prove that Jefferson would have attained a first rank in his profession. But he possessed no talent for oratory, and never made a conspicuous figure in debate.

While he was a student at law in Williamsburg, Jefferson heard the famous speech of Patrick Henry, in the Virginia house of delegates, against the stamp act. Animated by the spirit of that great orator, he from that time stood forth as a champion for his country. In 1769 he was chosen by the people of his county to represent them in the legislature of the province. In that capacity, which he maintained up to the period of the revolution, Jefferson made an unsuccessful attempt to procure the emancipation of slaves in Virginia. Thus his first important movement was in behalf of human liberty.

In January, 1772, Jefferson married Mrs. Martha Skelton, daughter of John Wayles, a distinguished Virginia lawyer. She was possessed of considerable property, and brought him a large dowry in lands and slaves, about equal in value to his own property. But his liberality and generous living left him insolvent at his death.

In the spring of 1773 he was appointed by the house of burgesses a member of the "committee of correspondence and inquiry for the dissemination of intelligence between the colonies," the plan of which he had aided in devising. After a second dissolution of the house in the spring of 1774, the members met privately, and recommended the election of deputies to a convention to meet on August 1st. Jefferson was chosen a member of this convention, but was prevented by illness from attending. He had, however, drawn up a paper to serve for instructions to the delegates to the general congress which the committee of correspondence had been directed to propose to all the colonies, and this he sent to Peyton Randolph, president of the convention. It was a bold, elaborate, and eloquent exposition of the right of the colonies to resist taxation, and contained the germ of the subsequent declaration of independence. The paper was offered, but not adopted, being regarded as too much in advance of public sentiment. It was printed in England as well as in Virginia, under the title of *A Summary View of the Rights of British America*, and extensively made use of by opposition speakers in parliament.

Jefferson attended the second convention, which met in March, 1775, and was placed upon the committee to report a plan of defense. The convention then elected delegates to the continental congress, and Jefferson was chosen as the alternate of Peyton Randolph. He took his seat there in June, 1775, after drawing up the reply of the Virginia assembly to the "conciliatory proposition" of Lord North. He was at once placed upon the committee to draw up the declaration of the cause of taking up arms, and was aided by John Dickinson in drafting the paper, of which congress approved. His answer to Lord North's proposition was adopted by congress with little alteration. Early in June, 1776, a committee to draw up a declaration of independence was appointed, with Jefferson for its chairman. The instrument was drafted by Jefferson, and with certain amendments was adopted, July 4th; the declaration still remains his noblest monument.

Jefferson was rechosen a delegate to congress, but resigned the appointment, his aim now being to carry out radical changes in the laws of his native state. He had drawn up a preamble and outline sketch of a new constitution for Virginia, and sent it to Edmund Randolph, president of the convention then sitting. His draft was not proposed, but his preamble was prefixed to the constitution framed by George Mason. The great reforms in the organic laws were still unattained, and to these Jefferson ardently addressed himself. He took his seat in the Virginia house in October, 1776, and was placed at the head of a committee of revision, the work of which continued for more than two years. Jefferson prepared bills for the repeal of the law of entail, for the abolition of primogeniture, and for establishing religious freedom.

The opposition to these measures among the aristocratic classes was determined, and the contest was prolonged for years. The bills were all finally passed, and the reorganization was complete. In addition to these radical measures Jefferson was the author of others of importance for the establishment of courts of law, and for a complete system of elementary and collegiate education. He strongly opposed the alleged scheme for appointing Patrick Henry dictator, and proposed and procured the passage of a bill forbidding the future importation of slaves.

In 1779 Jefferson exercised a wise benevolence in alleviating the condition of the British prisoners, who had been captured at Saratoga, and sent to Charlottesville, Virginia, to await the action of the British government. When the time came for their leaving Virginia, the officers addressed many letters of thanks to him for his kindness and hospitality. On June 1st, in the same year, he was elected by the legislature to succeed Patrick Henry, as governor of Virginia. He held that office two years, and then retired to private life. Soon afterward he was nearly captured by a party of British cavalry, sent to surprise the members of the assembly at Charlottesville. When pursued, Jefferson escaped on his horse, through the woods at Carter's Mountain.

M. De Marbois, the secretary of legation from France to the United States, wishing to obtain a general view of the geography, productions, statistics, government, history, and laws of the country, applied to Jefferson, who, in answer, wrote his famous *Notes on Virginia*, which work was soon after published both in French and English. The veracity and accuracy of its matter, and the simple beauty of its style excited general admiration. The work was written in 1781.

In 1782 Jefferson was appointed plenipotentiary by congress to join the able American negotiators then in Europe, but intelligence having been received that the preliminaries of a treaty of peace had been signed, his services were dispensed with. He was then elected a delegate to congress in 1783, and in the next year wrote notes on the establishment of a coinage for the United States. To him we are indebted for the dollar as a unit, and for our present system of coins and decimals.

In May, 1784, congress joined Jefferson with John Adams and Benjamin Franklin, as ministers plenipotentiary to negotiate treaties of commerce with foreign nations. In 1785 Jefferson succeeded Franklin as minister at the French court. Here he combated the intrigues of Vergennes and Calonne, the French ministers, in opposition to the desired treaties of commerce, and obtained the abolition of a number of monopolies, and the admission into France of tobacco, rice, whale oil, salted fish, and flour.

The society of Paris seemed admirably suited to the taste of Jefferson, and he was courted by the witty, learned, and scientific. His sociable disposition, winning manners, and brilliant conversation found full appreciation. He remained in Paris until the latter part of 1789, when he obtained leave of absence, and returned to the United States. Soon after his arrival, he received from President Washington the offer of a seat in his cabinet as secretary of state, which he accepted, though he was inclined to return to France. He entered the cabinet in March, 1790.

While in the cabinet under Washington, Jefferson made many able reports, and skillfully conducted the correspondence with foreign governments. But his partiality for France, and his disapproval of the chief measures proposed by Hamilton, caused constant bickering and contention. A strong opposition to the government was therefore formed, under the wing of Jefferson; then began the struggle between the federalists, headed by Alexander Hamilton, at that time secretary of the treasury, and the republicans under the lead of Jefferson.

Jefferson was a democrat by nature and training, strongly opposed to England and the English system, a friend to the revolutionary cause in France, and an unyielding advocate of state sovereignty and decentralization. In all the great measures Hamilton defeated his rival. In the spring of 1793 the paramount question of the neutral policy and rights of the United States arose, in view of the declaration of war just made by France against Holland and Great Britain. Upon this question was put forth the entire strength of the two great leaders of the federal and republican parties in the cabinet. The republican party was enthusiastic in its sympathy for France, and a disposition was shown to fit out privateers in American ports to cruise against English vessels. This was energetically opposed by the federal leaders. Jefferson advocated the propriety of receiving a minister from the French republic, which was determined upon.

This was followed by the appearance of Genet as minister, who authorized the fitting out and arming of privateers. The president ordered that Genet's privateers should leave the ports immediately, notwithstanding which he armed a prize and ordered her to sail as a privateer. A violent debate took place in the cabinet in Washington's absence. Hamilton advocated the erection of a battery to prevent the vessel from sailing. Jefferson opposed the scheme of a battery, on the ground that the vessel would not sail. Washington arrived and addressed a heated note to Jefferson; but explanations were made. In spite of all, the vessel sailed. Genet was finally recalled, and this affair terminated. It had aroused to the utmost extent all the bitterness in the hearts of the two great rivals, and the meetings of the cabinet were stormy. On December 31, 1793, Jefferson resigned his place in the cabinet, and retired to Monticello.

In 1796 the republican party supported Jefferson for the presidency; but John Adams received the highest number of votes, and Jefferson then became vice-president. During the time he held this office, he composed a manual for the senate, which for a long time held its place as the guide for congress and most other political bodies in the states, and which is still often appealed to in the transaction of business.

In 1800 Jefferson was again nominated for the presidency. This time he received a higher number of electoral votes than Adams; but Colonel Aaron Burr received the same number, and, therefore, the election devolved upon the house of representatives. Upon the thirty-sixth ballot, Jefferson received a majority, and became president. Colonel Burr, of course, became vice-president. Both entered upon the duties of their respective offices March 4, 1801.

The inaugural address of Jefferson was a lucid and forcible production, explaining his ideas of good government, and conciliating all parties. From its declarations, the federalists in office inferred that they would be allowed to remain at their posts. But Jefferson soon indicated his determination to reward his friends and remove his foes. This policy caused a considerable outcry at first, and the result was that a great many federalists, eager for office, joined the ranks of the republican party.

On May 14, 1801, the president wrote to Nathaniel Macon of North Carolina, a member of congress, giving information in regard to some of his projects, as follows: "Levees are to be done away with. The first communication to the next congress will be, like all subsequent ones, by message, to which no answer will be expected. The diplomatic establishments in Europe will be reduced to three ministers. The army is undergoing a chaste reformation. The navy will be reduced to the legal establishment by the last of this month. Agencies in every department will be revised. We shall push you to the utmost in economizing. A very early recommendation had been given to the postmaster-general, to employ no printer, foreigner, or revolutionary tory, in any of his offices. This department is still untouched."

Majorities in both houses of the seventh congress enabled the president to carry through many measures not otherwise practicable. Many acts obnoxious to the majority of the people were repealed; a uniform system of naturalization, which established the necessary residence of aliens to five years, was adopted at the suggestion of the president.

The foreign relations of the United States were managed with consummate skill. Difficulties occurred with Spain concerning the southern boundary. That monarchy ceded Louisiana to France, the government of which refused to allow the people of the United States to use New Orleans as a place of deposit. War was anticipated. The opposition in congress proposed hostile measures. But the president resolved to pursue a pacific policy. On January 11, 1803, he appointed James Monroe minister plenipotentiary to France to act with the regular minister, Robert R. Livingston, for the purchase of Louisiana. The commission was entirely successful; Napoleon, the first consul, sold the important territory for fifteen million dollars.

This great acquisition was a deep gratification to the friends of the president. Jefferson was of the opinion that an amendment to the constitution would be necessary to legalize the territory to the United States; but as congress and the people appeared satisfied no amendment was made. The repeal of the bankrupt law, an amendment of the constitution, changing the mode of electing the president and vice-president, and the sending out of the northwestern exploring expedition, under Lewis and Clarke, were the chief measures consummated during the remainder of Jefferson's first presidential term.

At the election in 1804 Jefferson and George Clinton were the candidates for the republican party, and Charles Cotesworth Pinckney and Rufus King were brought forward by the federalists. The result was the triumph of Jefferson and Clinton, by a vote of one hundred sixty-two to fourteen.

In his second inaugural address, delivered March 4, 1805, Jefferson exulted in the success which had attended his reform measures. But the gunboat system, which he had recommended instead of a navy, had entirely failed when put into practice, and upon this his political foes seized to found their attacks upon his new administration. Difficulties with Spain, France, and Great Britain, concerning boundaries and depredations upon commerce, furnished them with material, and for a long period their orators were active and violent in assailing the policy of the government.

In conformity with the recommendation of the president, congress passed an act prohibiting the importation of slaves after January 1, 1808. James Monroe and Charles C. Pinckney negotiated a treaty with the British government, which they considered highly favorable to the United States. But the president rejected it, and even refused to send it to the senate. This course excited much clamor among the federalists, and alienated a few republicans; but the sanction of the majority was given to it. The refusal to accept this treaty was a primary cause of the embargo and other restrictive measures, and tended to produce that bitter hostile feeling which led to the war of 1812.

However, the British government had, from the time of the revolution, pursued a policy calculated to irritate the people of the United States. The gross outrage upon the frigate *Chesapeake*, the continued impressment of the American seamen, and the seizure of American vessels were hostile movements not quietly to be borne. The embargo act, which was passed by congress on December 22, 1807, was the first movement of the United States toward retaliation. But it weighed heavily upon the American commercial community, and therefore excited violent denunciation. The ranks of the federalists were much strengthened. But a majority in and out of congress sustained the measures of the president.

The election of successors to Jefferson and Clinton terminated in the complete triumph of the republican party. James Madison was elected to the presidential chair, and George Clinton was reëlected to the vice-presidency. On November 8th Jefferson sent to both houses his last annual message. The foreign affairs of the country were in a critical state, and at home the embargo pressed heavily upon the trading community. But when Jefferson resigned the reins of government, he was assured that his successor would carry out his doctrine and policy.

After waiting to witness Madison's inauguration, Jefferson retired to his favorite Monticello on March 5, 1809. Here he lived a life of literary, scientific, and agricultural delight, surrounded by affectionate friends, and occasionally visited by learned sojourners from abroad. The principal object in which he took an interest, in his latter days, was the establishment of a system of education in Virginia. The university of Virginia was founded through his instrumentality in 1818, and chartered in the following year. He acted as rector from that time until his death.

In his old age his pecuniary circumstances became very embarrassing. Congress purchased his library for twenty-three thousand nine hundred fifty dollars. Still he remained deeply in debt. In 1825 he asked the legislature for permission to dispose of Monticello by lottery to prevent its being sacrificed to his creditors. The request was granted. But before Jefferson could take advantage of it, death overtook him. After a short illness he died on July 4, 1826, the fiftieth anniversary of the declaration of independence, at the age of eighty-three years. One daughter and ten grandchildren survived him.

In accordance with his own request, a granite obelisk was erected over his remains, bearing the inscription:

Here was buried
THOMAS JEFFERSON,
Author of the Declaration of American Independence, of the Statute of Virginia
for Religious Freedom,
and Father of the University of Virginia.

The inscription shows the pure and noble character of the fame which Jefferson desired.

In 1848 his manuscripts were purchased by congress, and published as *The Writings of Thomas Jefferson*, in nine volumes.

Jefferson, in his prime, was six feet two and a half inches in height, with a sinewy, well-developed frame. Although his face was angular, his countenance was amiable. He had deep-set, light hazel eyes, ruddy complexion, and hair of a reddish chestnut color in great profusion.

With manners eminently winning, sprightly, graceful, gay, he had a readiness and a fund of conversational talent rarely equaled. There was a charm about it which was scarcely possible to resist. He possessed in an eminent degree that instinctive perception of what is proper to be said, and what will please the hearer, which is embodied in the expressive word, tact. As a skillful and quick-sighted pilot perceives at a glance the rock to be avoided, the current to be availed of, and the precise moment at which to change the direction of his bark, and is able by an imperceptible pressure on the helm to evade each new danger, and pass unharmed through the narrowest strait and in the most threatening rapids, Jefferson could, in an instant, and with a wonderful ease and grace, turn the course of conversation, even with the most wary and inveterate enemy, so as to avoid irritation, touch his weak points, and all but make a captive of him against his own fixed purpose. In this, the most useful of talents to a politician, he was all French; there was none of the straightforward, blundering honesty of John Bull about him. He knew exactly what to say, and how to say it; and he said it.

Jefferson's voice was peculiar, very pleasant, seldom raised to a loud tone, and his words came "trippingly off his tongue." His step was light and elastic, and very rapid for a man of his gaunt form and elongated proportions. He affected republican simplicity of dress, though he was always neat and gentlemanly. His carriage presented the very curious and unusual contrast of a rapid, graceful movement with a long, awkward, bony frame.

He received company as if their visit was a gratification to him, and strangers always left him with the most grateful recollections of the man. Affecting popularity, he lost no opportunity of making an impression, especially on the common people. In this he was like Jackson, and the success of both was astonishing. Jefferson, it is true, was, in knowledge and mental cultivation, immeasurably the superior; but the means pursued by both were the same, and it was the same class in society whose indomitable attachment made both so mighty at the polls. His mingling much with this portion of the community, especially with mechanics, had, however, a double object; it was not merely, though mainly, for the sake of popularity; it was in part for the sake of knowledge.

Few men possessed a more inquiring mind, or a greater mass of various information, and Jefferson sought, in all who approached him, the means of increasing it. He would talk with a sea captain about navigation, and would, by a few words adroitly spoken, set him off upon his hobby and learn, meanwhile, some new fact or facts which had fallen under the mariner's observation in his voyages. He would talk with an astronomer about astronomy, and draw from him, in a short conversation, what it might have taken long to dig out of books. He was not profound, probably, in any department of human science, though he had a smattering of all.

He used often, while president, to walk down to the navy yard, early in a summer's morning, and, sitting down upon an anchor or a spar, enter into a familiar conversation with the surprised and delighted shipwrights, who would take the utmost pains to satisfy his inquiries. "There!" would cry one of his political opponents, as he passed by and noticed the group, "see the demagogue! There's Long Tom, sinking the dignity of his station, to get votes, and court the mob."

But this was unfair; Jefferson was a philosopher of investigating mind, gratifying its leading prosperity in the acquisition of knowledge. A man of such a cast would naturally be captivated by whatever was ingenious and new. Had he been less ambitious, a berth in the patent office would have placed him in his element. You could in no way more certainly fix his attention than by exhibiting and explaining a new machine, especially if connected with a scientific purpose.

As the author of the declaration of independence, of the statute of religious freedom in the constitution of Virginia, and as the founder of the democratic party, Jefferson has probably exerted a greater influence on the institutions of this country than any other American except Washington.

He was regarded as the very embodiment of democracy — that movement which dates from the American revolution of 1776, and still agitates all civilized nations. By whatever words the character of the struggle may be expressed — whether under the name of popular rights against exclusive privileges; or self-government, the government of the people, against absolute government, the government of a few; or by any other terms more or less appropriate — the contest is still going on, openly and actively in those so-called free governments, and silently and languidly in those where the sovereign power is opposed to the extension or introduction of new doctrines. The contest is between progress — right or wrong — and standing still; between change, without which there can be no improvement, and a desire to resist all change, which can hardly end in keeping things stationary, but almost necessarily leads to a backward movement. The contest is not only for the practical application of principles in government, which are vigorously maintained by the one party, and either not denied or faintly opposed by the arguments of the other, but also for the free expression and publication of all opinions on all subjects affecting the moral and political condition of society.

There is no individual, either in America or in Europe, who by his actions and opinions has had a greater influence on this contest than Thomas Jefferson. During a long and laborious life, both in official situations which gave him opportunities that his activity never let slip, and in private life in his extensive correspondence and intercourse with persons of all countries, he constantly, perseveringly, and honestly maintained what he conceived to be the principle of pure republican institutions. In the ardor of youth, his zeal and energy mainly contributed to animate his countrymen to declare their independence of a foreign power. In his maturer age, when a member of the general administration, he struggled, and he struggled at one time almost alone, against a monarchical and aristocratic faction, to maintain the great principles of the revolution, and develop the doctrines of a pure unmixed popular government. His influence gave to these doctrines a consistency, a form, and a distinctness which the mass of the nation could easily seize and retain. He thus became the head of a party in the United States, which, whether always rightly appealing to his doctrines or not for the vindication of their acts, still regards him as the father of their school and the expounder of their principles.

By his plain and unaffected manners and the freedom with which he expressed his opinions on all subjects, he gave a practical example of that republican simplicity which he cultivated, and of that free inquiry which he urged upon all. Such a man must always have many friends and many enemies. From his friends and admirers he has received, perhaps, not more praise than those who believe in the truth of his doctrines and the purity of his conduct are bound to bestow; by his enemies, both at home and abroad, he has been blackened by every term of abuse that bigotry, malice, and falsehood can invent.

The life of Jefferson, therefore, was a perpetual devotion, not to his own purposes, but to the pure and noble cause of public freedom. From the first dawning of his youth, his undivided heart was given to the establishment of free principles — free institutions — freedom in all its varieties of untrammeled thought and independent action. His whole life was consecrated to the improvement and happiness of his fellow men; and his intense enthusiasm for knowledge and freedom was sustained to his dying hour.

NAPOLEON I.

A. D.		AGE
1769	Born at Ajaccio, Corsica, ...	. .

1815	Returned to France; defeated at Waterloo; exiled to St. Helena,	46
1821	Died at St. Helena, ...	52

NAPOLEON BONAPARTE, or NAPOLEON I., emperor of the French, and the greatest general of modern times, was born at Ajaccio, in the island of Corsica, August 15, 1769. He was the son of Charles Marie Bonaparte, an officer under General Paoli, and Letitia Ramolino, a young woman of great beauty and courage. His family was eminently respectable but not illustrious, and he always disdained to take advantage of the adventitious luster of events.

Napoleon received the rudiments of his education at Ajaccio, where, by a curious coincidence, Count Pozzo de Borgo, afterward his persevering and bitter opponent through life, was also instructed. Having early evinced a decided taste for military life, he was, at the age of ten, sent to the military school at Brienne, France, and subsequently to Paris, where he remained until he obtained his commission in the artillery in 1785. Pichegru, afterward so famous, and whom Napoleon in the end destroyed, left the academy soon after young Napoleon. At this academy, where he remained several years, his talents, especially for mathematics and the exact sciences, attracted the attention of his preceptors.

He received his first commission in the artillery at the age of sixteen; but his first employment in real service was at the siege of Toulon in December, 1793, when it was observed "that a young lieutenant of artillery was very busy about a gun." Even in that subordinate situation, however, his talents made themselves felt, for it was by his advice that the operations were directed against an outwork on Mount Faron, which, when taken, by commanding the ships in the harbor, rendered the place no longer tenable.

When dictating a despatch there on the head of a drum to an obscure sergeant of artillery, a cannon ball fell close to them and threw a quantity of dust on the paper. "That is lucky," exclaimed the sergeant, "we shall not require sand for this paper." "What can I do for you," said Napoleon, "to evince my regard?" "Everything," said the sergeant, "you can convert my worsted shoulder knot into an epaulette." Napoleon recommended him for promotion and he got his commission. His name was Junot, and he afterward became duke of Abrantes, and one of the most distinguished marshals of France.

Napoleon acquired no little celebrity among the officers in the army by the energy and skill he had manifested at Toulon. The following report was sent to Carnot: "I send you a young man who distinguished himself very much during the siege, and earnestly recommend to you to advance him speedily. If you do not, he will most assuredly advance himself."

After the fall of Toulon, Napoleon was suspected, not without reason, of being implicated with the government of Robespierre, and shared in the disgrace of its fall. He remained in consequence for some time at Paris without any occupation, and in a state of extreme poverty. So low indeed were the fortunes of the future emperor fallen at this period, that, as he himself said, he never got his boots blackened, and never wore gloves, for they were a useless expense. His imagination, however, abated nothing of its vigor by the decline of his fortunes, and, despairing of effecting anything in Europe, he dreamed of the East, and entertained serious thoughts of offering his services to the grand seignior, with a view to pushing his fortunes in Asia. "Asia," said he, "contains six hundred millions of men; it is there alone that anything is to be done! Europe is worn out, there is nothing practicable here."

He responded, however, to important duties in his own country. Though suspected and, therefore, unemployed by the government of the directory, his abilities were well known. When the directors were reduced to extremities by the insurrection of the sections in October, 1795, the first great reaction against the crown and the honor of the revolution, they cast their eyes upon Napoleon as the only man who could resuscitate their tottering fortunes. The first day's conflict turned out entirely to the advantage of the insurgents, who were thirty thousand strong, all national guards, and comprised the whole flower and educated classes of Paris.

In great agitation the directors sent for Napoleon in the evening, and gave him the command of their forces, which were only five thousand, shut up in the squares of the Carrousel and the Louvre. Napoleon instantly took his line. In the night he despatched an officer, Murat, destined for future greatness, to Sablons, a camp in the neighborhood of Paris, where a park of fifty pieces of artillery was placed, which the chiefs of the national guard with inconceivable infatuation had neglected to seize. Murat got possession of the guns and brought them to the Tuileries. This decided the affair. Next day the insurgents commenced their attack from the church of St. Roche, in the Rue d'Honoré, and at the same time from the opposite side of the river. But they were received with so terrible a discharge of grape shot that after standing several rounds they broke and fled, leaving the victory to the regular troops and the government of the directory firmly established. Napoleon was rewarded, as well he might be, for this important victory, by the command of the army of Italy.

About this time he made the acquaintance of Josephine Beauharnais, whom he frequently met at the house of Madame Tallien. Captivated by her elegant manners and amiable disposition, he proposed marriage to the graceful widow, and was accepted. The ceremony took place March 9, 1796. But the events of a few days before, and his appointment to the supreme command of the army in Italy obliged him to leave his bride almost at the altar.

When young Napoleon took the command of the army in Italy he was only twenty-seven years of age, and wholly unaccustomed to high command. He found the troops in the most miserable condition, in want of everything. They were perched on the shining summits of the Maritime Alps, whither they had been driven by the united arms of the Austrians and the Piedmontese, in the preceding campaign. From their long sufferings he predicted a speedy change of their fortunes. "Famine, cold, and misery," said he, in his first proclamation, "are the school of good soldiers. Here on the plains of Italy you will conquer them, and then you will find comfort and riches and glory."

He was as good as his word. Descending like a torrent from the summit of the Alps, he soon carried everything before him. Having defeated the combined armies in several battles, he appeared before the walls of Turin and forced the Piedmontese government to conclude a separate peace with France, the condition of which was the cession of all their fortresses to the conquering republic, which at once gave him a solid footing in Italy, and a secure basis for ulterior operations against the Austrians.

Napoleon was not long in turning this basis to the best account. By forcing the "terrible bridge of Lodi," as he himself called it, although it was defended by twenty-five thousand Austrians, he gained the confidence of the entire French army. It was then, as he has told us in his memoirs, that high ambition took possession of his soul; he became impressed with the idea that he was destined to do great things.

On May 15, 1796, he entered Milan where he was received by the revolutionary party with a transport, which was soon cooled by the imposition of a contribution of eight hundred thousand pounds on its inhabitants. He then suppressed, with dreadful severity, an insurrection in Pavia. Following up his career of success, he defeated the Austrians in several encounters and compelled their commanders to shut themselves up in Mantua, a strong fortress in the center of the plain of Lombardy.

Now began that system of enormous and unscrupulous plunder in northern and central Italy which gives something of a barbaric character to the conquests of the French. The directory gave orders that Napoleon should levy contributions from all the states which he had gratuitously freed, and, according to his own account, he sent to France not less than fifty million francs. His officers and commissaries actually seized whatever they wished, provisions, horses, and all manner of stores; and because Pavia ventured to make some slight resistance to the shameful extortions of the republicans, Napoleon gave it up to havoc for twenty-four hours! A body of *savants*—including Monge, Berthollet, and others — was despatched to Italy to superintend the spoliation of its artistic treasures; both now and in the subsequent Italian campaigns, pictures, statues, vases, and MSS. were carried off in great numbers to gratify the vanity of the Parisians. In this way Lombardy, Parma, Modena, Bologna, and the states of the church were savagely harried before the end of June — Pope Pius VI., in particular, being forced to submit to conditions of extreme rigor.

Meanwhile, Austria had resolved to make another effort for the recovery of Lombardy. That power successively collected three powerful armies to relieve it, one of which, after a series of desperate actions, succeeded under the veteran, Marshal Wurmser, in penetrating to the fortress and reinforcing the garrison. But this advantage was gained only by incurring defeats in other quarters; for Napoleon, raising the siege, concentrated his forces and severely defeated the Austrians, who were incautiously advancing in two columns separated from each other by the lake of Garda. The blockade of Mantua, encumbered with ten thousand additional troops, was now resumed, and the Austrians assembled a second army for its relief, but it was defeated by Napoleon with desperate loss on the dikes of Arcola. A third body in the Tyrol, composed of the best troops in the monarchy, shared the same fate on the plateau of Rivoli, on the banks of the Adige, between Verona and Trent. Despairing now of being relieved, and having exhausted all his means of subsistence, Wurmser was obliged to capitulate. Napoleon, respecting his age and valor, granted him honorable terms, and this campaign closed with the French flag flying on Mantua and all the fortresses of the Adige, the barrier of the Austrian monarchy in that quarter.

Seriously alarmed now for the very existence of the monarchy, the cabinet of Vienna withdrew the archduke Charles, who in the preceding campaign had gained successes nearly as great in Germany as Napoleon had in Italy, to oppose the redoubtable conqueror on the Venetian plains. Charles brought with him thirty thousand of his best troops, flushed with victory on the Bavarian plains, and the two youthful conquerors were arrayed against each other on the banks of the Tagliamento. But the star of Napoleon prevailed. With equal skill and daring he forced the passage of the Tagliamento, and drove the archduke out of the Venetian plains into the passes of the Alps. Following him up, Napoleon drove him from one pass and one position to another, until he had placed the French standards on the Semmering, the last ridge of the Alps, before they melt away into the valley of the Danube, and from whence the steeples of Vienna are visible.

Driven now to their last shifts, the Austrians sued for peace, which Napoleon willingly accorded, for in truth his position, however brilliant, was full of peril from being too far advanced, with only thirty-five thousand men, into the Austrian dominions. On this occasion Austria and France adjusted their differences without difficulty; for, in return for large concessions to the conquering republic, the French handed over to them the whole dominions of the republic of Venice, a state which at first had been neutral, and had, in the close of the contest, effected a revolution in favor of France. This is one of the blackest instances of national ingratitude recorded in history.

After this peace Napoleon remained inactive for about a year, an object of the utmost jealousy and terror to the French government, to whom his unbending disposition, his ambition, and fame rendered him an object of the utmost apprehension. To get rid of so formidable a rival, they fell upon the experiment of offering him the command of a great expedition they were preparing against Egypt. As this promised to bring Napoleon into the theater of his early and favorite dreams of ambition, and as he conceived matters were not ripe for the revolution he meditated in Europe, he acceded to their offer. The expedition, the greatest that ever set out in modern times from the shores of Europe, accordingly sailed in 1798, having thirty-five thousand soldiers on board, conveyed by fourteen ships of the line and above three hundred transports.

Though the British admiral, Nelson, was in the Mediterranean straining every nerve to intercept the expedition, it arrived in safety before Malta, which at once capitulated to the French arms, and then steering for Alexandria disembarked the whole of the troops there in safety July 1, 1798. Napoleon, overjoyed with his good fortune in having escaped the English fleet, pursued his advantage with the utmost alacrity. Advancing from Alexandria toward Cairo, his army, after undergoing incredible hardships in the desert, arrived in sight of the Pyramids, where they beheld the Turkish army thirty thousand strong, of which fifteen thousand were splendid Mameluke cavalry, ready to receive them.

Impressed but not daunted by the noble spectacle, Napoleon said to his men, "From the summit of these monuments forty centuries are gazing upon you." They were not unworthy of their mission. Drawn up in squares, a deadly rolling fire as from so many flaming citadels issued from their ranks, a charge of cavalry completed the rout of the Turks, Cairo opened its gates, and the French dominion was established over the whole of Egypt.

Meanwhile, a dreadful reverse, apparently fatal to Napoleon's prospects in Europe, had occurred at sea. Nelson, having at length discovered the whereabouts of the French fleet, had sailed into the bay of Aboukir, where it lay moored under the protection of the land batteries, and totally destroyed it, one sail only having escaped to carry the mournful tidings to France. This catastrophe seemed fatal to the French army, for it cut them off from any communication with their country. Napoleon, however, was not discouraged. "We must remain here," said he, "or emerge from it great like the ancients"; and he immediately set about preparing for an expedition into Syria.

His plan was to rouse the Christian population of Lebanon and Asia Minor, and, reinforcing by their aid his French troops, to approach Constantinople from the Asiatic side, and place himself on the throne of the East. Surprising success in the first instance attended his efforts. He crossed the desert which separates Asia and Africa, stormed Jaffa, and cruelly massacred about three thousand prisoners taken in cold blood, laid siege to Acre, pushed on to Nazareth, and defeated forty thousand Ottomans with great slaughter, at Mount Tabor.

But this was the summit of his success. Sir Sidney Smith landed with a party of marines from the British ships at Acre, placed himself with his brave followers in the breach, when the place was on the point of falling, and infused such vigor into the defenses that all the assaults of the French were repulsed, and Napoleon, abandoning all his ideas of oriental conquest, was obliged to wend his way back with disgrace to Egypt. During the retreat he is said to have poisoned a number of his wounded soldiers, to prevent them from falling into the hands of the Turks, by whom they would have been barbarously massacred. Soon afterward he was consoled for his reverses by a victory over twenty thousand Janizaries, whom the English landed in the bay of Aboukir.

Yet though so great a career awaited him in Europe, Napoleon never ceased lamenting his check at Acre, and repeatedly said, when revolving his eventful career in the solitude of St. Helena, when speaking of Sir Sidney Smith, "That man made me miss my destiny." But another fate awaited the young general. France speedily felt the want of his tutelary arm when it was withdrawn. "The sun of Bonaparte," as Pitt expressed it, "was falling before the rising star of Suvaroff." That daring and celebrated general, at the head of a combined Austrian and Russian army, had defeated the French in several pitched battles on the plains of Lombardy, regained all the fortresses, surmounted the Maritime Alps, and appeared on the shores of the Var, on the frontiers of Provence. The republicans had been entirely driven out of Germany, and Masséna, shut up in France with fifty thousand men, with difficulty maintained himself against the superior army of the archduke Charles.

In these circumstances all eyes were turned to Napoleon as the only man capable of saving the country. He now felt, in his own words, that "the pear was ripe," and he resolved to return to Europe. His usual good fortune did not desert him on this occasion. Setting sail in a single frigate from Alexandria, he eluded the English cruisers who were anxiously looking out to intercept his return, and landed safe at Cannes, in southern France, in October, 1799. From thence he proceeded to Paris, where, finding the government of the directory utterly discredited, and in the last stage of decrepitude, he ventured a bold *coup d'état*, expelled the legislatives from their halls by means of fixed bayonets, and under the name of "first consul" seated himself on the throne of France.

His first care after this great success was to expel the Austrians from Italy, the scene of his earliest triumphs and of such obstinate conflicts between them and the French. His plan for this purpose was laid with equal skill and secrecy. Assembling an army, styled "the army of reserve," at Dijon, in the heart of France, he suddenly led them across the St. Bernard, a pass eight thousand feet high, deemed impassable for artillery or carriages, overcame the resistance of the fort of Bard, in the southern declivity of the mountain, entered Milan in triumph, defeated the Austrian advanced guard, ten thousand strong, at Stradella, and encountered their main body thirty thousand strong returning from the Var, at Marengo. After an obstinate conflict, on which he was on the point of being destroyed, he defeated them with great slaughter.

The peculiar position of the two armies rendered this victory decisive, and demonstrated the strategical skill with which Napoleon's plan and campaign of the march across the St. Bernard had been laid. The Austrians, returning from the Var, fought with their faces toward Vienna, and their backs toward the Maritime Alps and the bay of Genoa. Defeat in such circumstances was ruin; and Melas, the Austrian commander, was too happy to conclude a convention, in virtue of which he was allowed to retire to Mantua, after delivering up the whole of the fortresses of Piedmont to the victorious French.

Securely seated by this great triumph on the consular throne, Napoleon shortly forced the Austrians to make peace at Lunéville, and thereby pacified the whole continent. Soon after he underwent a deep humiliation, however, by the successful result of the English expedition, under Sir Ralph Abercrombie, to Egypt, and the wresting from his grasp of his whole conquests on the banks of the Nile. His projects for the destruction of Great Britain, also the great object of his life, were blasted about the same time by Nelson's victory at Copenhagen, which destroyed the northern coalition, and the death of the emperor Paul, which withdrew Russia from that formidable alliance. England and France now had no longer the means of fighting. They could not reach each other, for they were both victorious in their respective elements, and like monsters of the land and deep their hostility could not be exerted against each other. Sensible of this they concluded peace in March, 1802, which put the first period to the dreadful hostilities of the revolutionary war.

The peace, however, proved only an armed truce. Both parties were only gaining breath for a renewal of the fight. In August, 1802, Napoleon was made consul for life, and did great things at home during its continuance. He was busy superintending the drawing up of a code of civil laws for France. He assembled the first lawyers in the nation, under the presidency of Cambacérès, and frequently took part in their deliberations; the results of their labors were the *Code Civil des Français*, *Code de Procédure*, *Code Pénal*, and *Code d'Instruction Criminelle*, besides commercial and military codes, all of which often go loosely under the name of the *Code Napoléon*. The first of these is an admirable production, and is in force to the present day. Considerable attention was also paid to such branches of education as were likely to promote efficiency in the public service. Mathematics, physical science in all its departments, engineering, etc., were as vigorously encouraged as philosophy, ethics, and political speculation were discouraged.

The best proof that Napoleon wanted not an educated people, but only active and expert tools and agents, was the indifference that he manifested to primary and elementary education. In a population of thirty-two million, the number of pupils under ten years is given by Fourcroy at only seventy-five thousand! The internal government was the acme of despotic centralization. Napoleon appointed all prefects of departments, and all mayors of cities, so that not a vestige of provincial or municipal freedom remained. He ruled France as he ruled the army of France. In May, 1804, he was proclaimed hereditary emperor of the French, and the year after king of Italy.

Peace between France and England did not last long. Napoleon's policy in Italy irritated the British government, and, as remonstrances were ineffectual, war was declared against France. First, Napoleon formed a gigantic fleet for the subjugation of England, which very nearly proved successful. Having succeeded in forcing Spain to his alliance, he had a project for assembling in the channel seventy sail of the line, who were to transport one hundred thirty thousand men into England, and thirty thousand into Ireland, on board two thousand gunboats, which he had prepared at Boulogne for their conveyance across the channel.

Vast as the plan was, it was on the very verge of proving successful. The Toulon fleet set sail from Cadiz, and decoyed Nelson into the West Indies; speedily returning it encountered Sir R. Calder off Finisterre, who, with fifteen sail of the line, defeated twenty-seven French craft and took two sail of the line. This action proved fatal to the whole design. Villeneuve, who commanded the combined squadron, retreated to Ferrol. From Ferrol, instead of proceeding to Brest, where Admiral Gantheaume was ready with twenty-one sail of the line to join him, he went to Cadiz, where he was soon blockaded by Nelson, and totally defeated by him with the loss of twenty sail of the line, October 21, 1805.

Thenceforward the maritime war was at an end, and Napoleon had to trust solely to continental victories for the destruction of the English. Instantly taking his line, he extracted out of his maritime defeat the means of achieving his greatest land triumphs. Russia had joined Austria, and the army of the latter, eighty thousand strong, had advanced to Ulm, in Bavaria. Crossing France and the north of Germany with incredible rapidity, Napoleon defeated the Austrians in several actions, and at length shut up thirty thousand in Ulm, where they were forced to capitulate the very day before the battle of Trafalgar. Advancing then, at the head of one hundred eighty thousand men, down the valley of the Danube, he captured Vienna, and, on December 2, 1805, totally defeated the combined Austrian and Russian armies at Austerlitz, under their respective emperors. This catastrophe drove Austria to a separate peace, that of Presburg, by which Austria ceded to France all her Italian and Adriatic provinces. The Russians, weakened by the loss of thirty thousand men, in mourning wended their way back to their own dominions.

Next year the Prussians with infatuated hardihood rushed into the field. Napoleon encountered them at Jena and Auerstädt, and defeated them with such loss that in a few weeks one hundred thousand men had disappeared out of one hundred twenty thousand, with which they had commenced the conflict. Prussia was speedily overrun, Berlin taken, and the remnant of their armies driven back to the Vistula, where they were supported by the Russians, who now came up in great strength. Several bloody actions took place during the depth of winter, in which the French discovered the sturdy nature of the new antagonists with whom they had to deal, and in a pitched battle fought at Eylau, on February 8, 1807, the French emperor was defeated with the loss of thirty thousand men. But in due time he had his revenge. Having gathered up all his reserves, and collected one hundred fifty thousand men round his standard, he attacked the Russians in June, and after several bloody actions defeated them in a pitched battle at Friedland, on June 14th of the same year. The result of this triumph was the treaty of Tilsit, which, virtually destroying all lesser powers, in effect divided the whole continent of Europe between Napoleon and Alexander.

Insatiable in ambition, Napoleon had no sooner achieved this great victory over his northern enemies than he turned his eyes to the Spanish peninsula, seized on Portugal, without a shadow of a pretext, and decoyed the king, queen, and heir apparent of Spain to Bayonne, where, with threats, treachery, and cajolery, he succeeded in extracting from them all a renunciation of the throne of Spain, upon which he immediately placed his own brother, Joseph, and at the same time gave the throne of Naples to his brother-in-law, Murat. About the same time he put in force the famous Berlin and Milan decrees, intended to exclude the English permanently from the whole trade of continental Europe. His abominable treachery to the Spanish royal family incited a frightful war in the peninsula, which at first was attended with surprising success. Dupont surrendered with twenty-five thousand men to Castanos, in Andalusia. Portugal was recovered by Wellington, and the French were obliged to retire behind the Ebro.

But Napoleon was at hand to repair the disaster. Directing his whole reserves from Germany to Spain, he entered Navarre at the head of two hundred thousand men, defeated the Spaniards in several battles, retook Madrid, and pursued the English under Sir John Moore into Galicia, where, though they gained at the eleventh hour a glorious victory at Corunna over Soult and Ney, they were forced to embark and return to England, weakened by a third of their numbers, having lost the whole objects of the campaign. Austria deemed the moment favorable, when the chief forces of Napoleon were immersed in the peninsula, to endeavor to regain some of her lost provinces. She declared war accordingly in April, 1809, and advanced with one hundred thousand men into Bavaria, where the archduke Charles at first gained considerable success. But Napoleon fled to the spot, defeated the Austrians in three pitched battles, and, treacherously gaining possession of the bridge of Vienna, made himself master of the capital.

Napoleon sustained, however, at the battle of Aspern, a severe check from the archduke Charles, who defeated him with the loss of thirty thousand men, and brought him to the very verge of ruin. He recovered himself, however, and, having collected one hundred fifty thousand men in Vienna, threw six bridges in one night over the Danube, and on the field of Wagram defeated the Austrians in a pitched battle which lasted two days. This triumph for France deprived Austria of a fourth of her dominions.

Napoleon appears to have now come to the conclusion that he could only put a stop to the hostile machinations of the old legitimate dynasties by intermarrying with some one of them. Besides, his wife Josephine had no children — and he was ambitious of perpetuating his power in his family. With that callousness to everything except his own interests, which was a prominent feature of his character, he immediately proceeded to divorce her. The act of divorcement was solemnly registered on December 16, 1809. Less than three months afterward he married Maria Louisa, archduchess and daughter of the emperor of Austria. He was now at the zenith of his power, and so, according to the old Greek belief, Nemesis was on his track.

What caused his ruin was really that outrage on civilization — the Berlin decree. Russia found it impossible to carry it out, without permanent injury to her great landowners; Sweden and other countries were in a similar predicament. This led to evasions of the decree, and these, again, involved Russia particularly in further complications, until finally, in May, 1812, Napoleon declared war against that country. In spite of the advice of his most prudent advisers, he resolved to invade the country; he accordingly crossed the Niemen at the head of five hundred thousand men, the greatest military armament of real soldiers ever seen since the beginning of the world.

The Russians had not half the force to resist this crusade, and the consequence was they were driven back into the very heart of their territories. Smolensk was stormed by Napoleon in person, and in a desperate battle fought at Borodino, on September 6th, when thirty thousand men fell on both sides, the Russians were so far worsted that they were obliged to abandon Moscow to the conquerors. But this was the extreme point of the French emperor's success. The Russians burned their ancient capital to prevent it from affording shelter to the enemy.

The French, reduced now by the sword, fatigue, and sickness to one hundred thousand men, were obliged to retreat on the wasted line of their former advance; and, the cold having set in with great severity, they were attacked by the Russians on several occasions with such success that not twenty thousand escaped across the Niemen, nearly all in the last stage of exhaustion and misery. Napoleon himself abandoned his troops in the midst of their sufferings, and made his escape to Paris on a sledge accompanied by a single attendant.

This terrible and unexampled reverse, coupled with the victorious career of Wellington in the same year in Spain, who had defeated the French in a pitched battle at Salamanca, recovered Madrid, and liberated all the southern provinces of Spain from their oppressors, produced a general insurrection in Europe. Prussia took up arms; desperate battles were fought at Lützen, Bautzen, Dresden, and other places; at length, Napoleon having made a last stand at Leipzig, the "battle of nations" began on October 16, 1813. Three hundred thousand Germans and Russians commenced the attack, which two hundred thousand French resisted. Twenty-five hundred pieces of cannon spread destruction around, and after a bloody conflict of two days' duration Napoleon was totally defeated with the loss of forty thousand men and two hundred fifty guns, and with difficulty brought back sixty thousand of his vast army behind the Rhine.

At the same time Wellington, who had totally defeated King Joseph in person at Vittoria, had crossed the Pyrenees and was threatening Bayonne. The French empire on all sides was crumbling into ruins. Early in the following spring the allies invaded France along the whole course of the Rhine, while Wellington pursued his career of success in the south of France. Driven to extremities, Napoleon exerted himself to the utmost, and exhibited the most splendid military abilities. But although he gained, with forces greatly inferior, several important victories over the allies, he was at length overpowered. Paris was taken by the emperor of Russia and king of Prussia in person, at the head of two hundred thousand men. The Bourbons were restored to the French throne; Napoleon, dethroned, was banished to the isle of Elba, where a mimic sovereignty was permitted him to console his mind after such a dreadful series of reverses.

But the restless mind and ambitious spirit of Napoleon could not long rest in this state of forced seclusion. Having ascertained that discontent was universal in the French army, the natural result of their misfortune, he set out from Elba, in 1815, accompanied by six hundred of the old guard who had shared his exile, and landing at Cannes, marched to Paris without opposition, dethroned Louis XVIII., and reëstablished himself on the throne of France. He was then immediately denounced by the allied sovereigns, who set about collecting forces on his frontiers. Despairing of averting a war by negotiation, Napoleon resolved, with his usual vigor and decision, to anticipate the allies and strike the first blow. He all but succeeded.

Having crossed the frontier of Flanders, Napoleon, on June 16, 1815, attacked and defeated the Prussians, eighty thousand strong, under Blücher, at Ligny, and the same day sustained a bloody conflict with Wellington's advance guard, in which the French were at length routed at Quatre-Bras. Two days after Napoleon met the stroke of fate. Wellington retired to and stood firm at Waterloo, where on the 18th he gave battle to the French, with an army nearly equal numerically, but greatly inferior in artillery and the quality of his troops. A desperate battle ensued, in which both parties displayed prodigies of valor, and victory long seemed doubtful. At length the Prussians came up late in the evening, and Napoleon was by the united allied force totally defeated with the loss of forty thousand men and one hundred fifty pieces of cannon.

The victory was decisive, and Napoleon fled to Paris. The national assembly fiercely insisted on his abdication. He did so, June 22d, in favor of his son, Napoleon II. They further demanded that he should leave the country forever, and he retired to Rochefort, with the design of embarking for the United States. On July 7th the allies again entered Paris, and refused to acknowledge the acts of the French provisional government. Napoleon, who saw that he could not escape either by sea or land, voluntarily surrendered, July 15th, to Captain Maitland, of the *Bellerophon*, claiming the protection of British laws. However, it was resolved by the British government to confine him for life on the isle of St. Helena, a lonely rock in the southern Atlantic, one thousand miles from the coast of Africa. He was therefore conveyed thither by Admiral Cockburn, and landed at St. Helena, October 16, 1815.

The remainder of Napoleon's life was politically insignificant; but he wrote several most able and interesting works, chiefly relating to his eventful career, which, with his long series of victories, have contributed to his colossal fame. At the same time he fretted beyond measure at being denied the title of emperor, and at being attended even at a distance by an English escort in his rides.

He was magnificently treated by the English government, who expended twelve thousand pounds a year on his private establishment, and four hundred thousand pounds yearly on the island; but his ardent spirit could not brook even supposed indignity and real inaction. His imaginary grievances, coupled with a hereditary malady, cancer of the stomach, of which his father had died, brought on a mortal disorder, which led to his death, on May 5, 1821. He quitted this life during a terrible storm of wind and rain, which recalled to his mind the roar of battle. His last words were *Tête d'armée* — "head of the army."

He was first interred in Slane's valley, in the island of St. Helena, from whence his remains were, in December, 1841, with the consent of the English government, transferred to Paris, where on the 15th of that month they were interred in a mausoleum under the dome of the Hôtel des Invalides, and now repose beside the bones of Turenne and Vauban, the paladins of France.

It is upon a military foundation that Napoleon's fame must rest. Although his stature was small, his appearance was most imposing. He had a lofty forehead, a quick and piercing eye, a firm mouth, and a strong chin. His whole countenance was expressive of deep thought, rapid insight, an iron force of will, and a daring ambition. Amid the noise of battle all these qualities came into active play. To scan the enemy's army, to detect the weak point, and to hurl masses of troops against that point was the work of an instant. If his soldiers failed in the attack, he was immediately among them, driving them to a fresh onset. If they were again unsuccessful, he had a battalion of picked men, who charged, and rarely failed to throw the foe into hopeless rout.

There has probably never been in the history of the world any man who has combined like attributes of intellect and will in so high a degree as Napoleon. It has been said, not without reason, that as a general Cæsar gave proof of greater originality of genius, inasmuch as he never repeated the same stratagem or mode of warfare, but always had a fresh invention for every new emergency. But, even if it be admitted that in fertility of invention Napoleon was inferior to Cæsar, it may, on the other hand, be safely affirmed that not only in his power of combination — of embracing in one harmonious plan a great number of distinct and independent elements — but also in watching over and directing at one and the same time the complicated movements of mighty armies, the tone of the public press, the operations of foreign and domestic commerce, in addition to the endless intricacies and details of his system of police, and the great measure of his government, not merely in France, but through the whole extent of his vast empire — he was unequaled by any commander or sovereign that ever lived.

But, whatever may be thought of the genius of Napoleon as compared with that of other great commanders, it cannot be denied that in some respects his career was the most extraordinary, and his destiny the most wonderful, of any recorded in the annals of mankind. Other rulers may have wielded a power as extensive and even more absolute; but they cannot, like Napoleon, boast of having been the sole architects of their own fortunes — of having risen, like him, from an absolutely private station to the highest pinnacle of greatness. Cyrus and Alexander inherited each, as his birthright, a powerful kingdom; Hannibal and Cæsar were respectively the recognized representatives of high and influential families. Napoleon, on the contrary, besides his energy and his genius, possessed not a single advantage that might not have fallen to the lot of the humblest citizen of France.

No other sovereign of whom history makes mention ever maintained himself, even for a single day, against such a combination of gigantic powers; yet Napoleon not only maintained himself, but for twelve years was constantly adding to his dominions in the face of an opposition such as was never before or since arrayed against any single ruler. And he fell at last, so to speak, by his own hand. He seems to have possessed every intellectual endowment except wisdom, and every form of power except moral power. His ambition, and the desire to exert his imperious will, often led him to embrace measures which his cooler judgment disapproved.

His invasion of Spain was a remarkable instance of this. No one saw more clearly than he the difficulties and dangers to be encountered in such a war. In a letter addressed to Murat, in 1808, he says: "Do not imagine that you have only to make a display of your troops in order to conquer Spain. They may raise levies against us *en masse* which will render the war eternal. I have at present partisans, but if I show myself in the character of a conqueror I cannot retain one of them." Again, with prophetic forecast, he says: "If war once break out, *all is lost.*" Yet, in spite of what he so clearly foresaw, he adopted a course which rendered war inevitable. He afterward said, bitterly, "That wretched war was my ruin: it divided my forces, multiplied the necessity of my efforts, and *injured my character for morality.*"

Having lost his reputation for morality, his subjects and allies ceased to have any confidence in his words, and his vast empire, no longer cemented by "that faith which binds the moral elements of the world together," was already beginning to crumble, when his fatal campaign in Russia annihilated his grand army and involved him in irretrievable ruin. With all his sagacity, he committed the stupendous error of supposing that he could, in the nineteenth century, hold Europe in subjection by the mere force of his intellect and will, without the exercise of any strictly moral attributes, and without laying the foundation of his power in the affections of the people.

"That Napoleon," says Channing, "possessed greatness of action, we need not prove, and none will be hardy enough to deny. A man who raised himself from obscurity to a throne; who changed the face of the world; who made himself felt through powerful and civilized nations; who sent the terror of his name across seas and oceans; whose will was feared as destiny; whose donatives were crowns; whose antechamber was thronged by submissive princes; who broke down the barrier of the Alps, and made them a highway; and whose fame has spread beyond the boundaries of civilization to the steppes of the Cossack and the deserts of the Arab — a man who had left this record of himself in history has taken out of our hands the question whether he shall be called great. All must concede to him a sublime power of action — an energy equal to great effects."

DANIEL WEBSTER, distinguished as statesman, lawyer, orator, and publicist, was born at Salisbury, New Hampshire, January 18, 1782. He was the second son of Ebenezer Webster, a farmer, and his second wife, Abigail Eastman, both persons of vigorous intellect and uncompromising morality.

On account of the delicacy of his constitution, Daniel was permitted to pass a large part of his childhood in play, which he dearly loved. He also loved books, among which Addison's *Spectator* was an especial favorite with him. Having gained the rudiments of education at home, and in the common schools of the vicinity, he was sent, in May, 1796, to Phillips Exeter academy, of which Benjamin Abbot was then the principal. Young Webster was at that time so diffident, as he himself tells us, that he could not be induced to declaim before the school. "The kind and excellent Buckminster," he tells us in his autobiography, "sought to persuade me to perform the exercise of declamation like other boys, but I could not do it."

He remained at Exeter about nine months. In February, 1797, he began his studies under Rev. Samuel Wood, of Boscawen. His father, although burdened with a large family and hardly able to defray the expense, had resolved to send Daniel to college. After he had read six books of Vergil's *Æneid*, and some of Cicero's orations, and had obtained a little knowledge of the Greek grammar, he entered Dartmouth college in August, 1797. According to his own statement, he was "miserably prepared both in Latin and Greek," and he had little taste or genius for mathematics. But his habits at college were studious and regular; and "by the close of his first year," says Edward Everett, "young Webster had shown himself decidedly the foremost man of his class; and that position he held through his whole college course." He was also the best writer and public speaker in the college.

By teaching school during vacations he earned money, which he gave to aid his elder brother, Ezekiel, whom the family also sent to college, entailing great sacrifices and privations. Daniel graduated in August, 1801, and began to study law in the office of Thomas W. Thompson of Salisbury, who was elected to the senate of the United States in 1814. In order to further help his brother,

who was still in college, he took charge of an academy at Fryeburg, Maine, at a salary of three hundred fifty dollars per annum. Here he remained about eight months, returning to Thompson's office in the autumn of the year 1802.

To perfect his legal education he went to Boston in July, 1804, and had the good fortune to be received as a clerk in the office of Christopher Gore, an eminent lawyer and statesman. Here he read the classic legal works of Vattel and Puffendorf, but devoted himself chiefly to the study of the common law, and was admitted to the bar in March, 1805. He practiced nearly two years at Boscawen, and in 1807 removed to Portsmouth, New Hampshire, where in June, 1808, he married Grace Fletcher, of Hopkinton, New Hampshire. He rose rapidly in his profession and was soon regarded as a fit antagonist for Jeremiah Mason, who was the greatest lawyer in the state, and many years older than Webster.

In November, 1812, he was elected as a federalist to the national house of representatives, in which he took his seat in May, 1813. He opposed the war against Great Britain, took active part in the debates which that war occasioned, and advocated an increase of the navy. His speeches on these subjects placed him in the first rank as a debater. He was reëlected to the fourteenth congress, which met in December, 1815, when the violence of party spirit had greatly abated, and the return of peace had directed the attention of the national legislature to new and important questions. Among these was the charter of the bank of the United States, to which he moved an amendment requiring the bank to pay deposits in specie. He also rendered an important service by a resolution presented in 1816, requiring that all payments to the public treasury be made in specie or its equivalents — which resolution was adopted and greatly improved the currency of the country.

Webster now resolved to retire from public life and devote himself to his profession. He therefore moved in 1816 from Portsmouth to Boston. In this wider arena his professional reputation was greatly increased and he became in a few years the foremost lawyer in New England. His argument before the supreme court of the United States in the Dartmouth college case, in 1818, raised him to the highest rank as a constitutional lawyer. The case was decided in favor of his clients and by this decision the law of the land in reference to collegiate charters was firmly established.

Thenceforth Webster was retained in many important cases that were argued before the supreme court at Washington. He exhibited great skill as a criminal lawyer, in cross-examining witnesses, and in baffling the deepest plans of perjury and fraud. The effect of his arguments was enhanced by a deep-toned, musical, and powerful voice, and by the magnetism of his imposing presence and personal qualities. "His influence over juries," said a contemporary authority, "was due chiefly to a combination of the power of lucid statement with his extraordinary oratorical force. His power of setting forth truth was magnificent."

In 1820 Webster was a member of the convention which met to revise the constitution of Massachusetts. Of his services in this convention, Judge Story expressed a high opinion in a letter to a friend, saying, "The whole force of his great mind was brought out, and in several speeches he commanded universal admiration." In December of the same year he pronounced at Plymouth his celebrated oration on the anniversary of the landing of the Pilgrim fathers. "This," says Edward Everett, "was the first of a series of performances, aside from the efforts of the senate and the bar, by which Mr. Webster placed himself at the head of American orators." After the delivery of the Plymouth oration, the whole of the year 1821 was filled with private and professional pursuits.

In 1822 he was elected by the voters of Boston a member of the congress which met in December, 1823. In this body, in January, 1824, he made a famous speech on the subject of the Greek revolution, in which he denounced the principles of the holy alliance with powerful effect. The subject of the tariff was discussed at this session, and Webster opposed an extravagant increase of protective duties. As chairman of the judiciary committee he reported a complete revision of the criminal law of the United States, which was approved by the house. In the autumn of 1824 he was reëlected by a nearly unanimous vote, and supported John Quincy Adams in the ensuing election for president.

In June, 1825, Webster delivered an oration on laying the corner stone of the Bunker Hill monument. To the same class of orations belongs his admirable eulogy on Adams and Jefferson, pronounced in Faneuil hall, Boston, in August, 1826. "His consummate skill of composition and delivery," says George Ticknor Curtis, "gave to a supposititious speech of John Adams all the effect of a real utterance of that patriot." George Ticknor, who heard the eulogy, says, "His bearing, as he stood before the vast multitude, was that of absolute dignity and power."

He continued to serve in the house of representatives until 1827, when he was transferred to the senate of the United States. As a senator he voted for the tariff bill of 1828. Though not deeply interested in the presidential election of 1828, he supported John Quincy Adams in preference to General Jackson. Having lost his first wife in January, 1828, he married Caroline Le Roy of New York city in December, 1829.

His most admirable parliamentary effort was his eloquent reply to Hayne, of South Carolina, who had affirmed the right of a state to nullify the acts of congress, had assailed New England, and had provoked Webster by caustic personalities. It was on January 26, 1830, that Webster began this great argument in defense of the Union and the constitution, which was probably the most remarkable speech ever made in the American congress. His peroration ends with the following magnificent passage:

"When my eyes shall be turned to behold for the last time the sun in heaven, may I not see him shining on the broken and dishonored fragments of a once glorious Union; on states dissevered, discordant, belligerent; on a land rent with civil feuds, or drenched, it may be, in fraternal blood! Let their last feeble and lingering glance rather behold the gorgeous ensign of the republic, now known and honored throughout the earth, still full high advanced, its arms and trophies streaming in their original lustre, not a stripe erased or polluted, nor a single star obscured — bearing for its motto no such miserable interrogatory as, What is all this worth? nor those other words of delusion and folly, Liberty first, and Union afterward — but everywhere, spread all over in characters of living light, blazing on all its ample folds as they float over the sea and over the land, that other sentiment, dear to every true American heart — Liberty *and* Union, now and forever, one and inseparable!"

"Webster had," says Curtis, "but a single night in which to make preparation to answer the really important parts of the preceding speech of his opponent."

In May, 1832, he made an important speech for the renewal of the charter of the bank of the United States. This bill passed both houses of congress, but was vetoed by President Jackson. About this date he purchased an estate at Marshfield, Massachusetts, on the seashore, which was his usual summer residence. He supported Clay for president in the election of 1832, but in the great crisis of the nullification question, in 1833, he opposed Clay's compromise tariff bill, and voted for the "force bill" of the administration. On these subjects Webster and Calhoun were adversaries in debate. Webster became one of the most popular leaders of the whig party, which was organized about 1834, and he was nominated for the presidency by the whigs of Massachusetts.

In September, 1837, as a member of the senate, he opposed the subtreasury bill in an elaborate speech, said to have been the most effective of all his arguments on the subjects of currency and finance. He visited England, Scotland, and France in 1839, and particularly attracted the admiration of Carlyle, who met him at a dinner, and afterward wrote this estimate of him: "He is a magnificent specimen. As a logic-fencer, advocate, or parliamentary Hercules, one would incline to back him, at first sight, against all the extant world."

Webster was reëlected to the senate in January, 1839, and actively promoted the election of General Harrison to the presidency in 1840, by public speeches in various states. In March, 1841, he was appointed secretary of state by President Harrison, after whose death he was retained in that office by President Tyler. In that capacity he negotiated with the English ambassador, Lord Ashburton, a treaty which settled the long and serious dispute about the northeastern boundary of the United States. This important treaty was signed August 9, 1842.

In compliance with the general desire of the whigs, whose interests President Tyler had betrayed, Webster resigned office in May, 1843. He was now urged to return to the United States senate; but he hesitated on account of his private interest and duties. In a letter dated February 5, 1844, he says, "I am now earning and receiving fifteen thousand dollars a year from my profession, which must be almost entirely sacrificed by a return to the senate."

In the campaign of 1844 he earnestly advocated the election of Henry Clay, who was his chief rival in the favor and leadership of the whig party. He opposed the annexation of Texas, for the reason that it would involve the extension of slavery. And largely upon this issue he was again elected a senator of the United States in the winter of 1844-45, as the successor of Choate. In December, 1845, he made a speech in the senate against the admission of Texas as a slave state, and in February, 1847, he declared that he was opposed to the prosecution of the Mexican war for the conquest of territory to form new states of our Union.

Although Webster and his friends were disappointed by the nomination of General Taylor, in 1848, Webster voted for him in preference to General Cass. In consequence of the acquisition of Mexican territory by conquest, the sectional conflict relative to slavery became more and more violent and irrepressible, with an alarming proclivity toward disunion. The houses of congress became, in 1850, the scene of intense excitement about the admission of California and the organization of the new territories. The imminent danger of this crisis was averted or postponed by Clay's "compromise measures," which Webster supported in an elaborate speech on March 7, 1850, with the result of bringing about some very caustic criticism.

This compromise consisted of a number of resolutions, one of which declared that the new territories should be organized without the adoption of any restriction or condition on the subject of slavery; and another, that more effectual provision ought to be made by law for the restitution of fugitive slaves. On the first of these points he argued that he would not reënact by human law what was already settled by a law of God; that slavery could not be introduced into those territories, because of their natural unfitness for slave labor. His support of these measures gave great offense to many of his admirers, and to the opponents of slavery, who accused him of sacrificing an important principle to a supposed political expediency. Even Seward spoke of Webster as "a great statesman, who for a large portion of his life led the vanguard of the army of freedom, and who, when the test came, surrendered that great cause, and derided the proviso of freedom, the principle of the ordinance of 1787."

In July, 1850, before the final vote on the compromise bill, President Taylor died and was succeeded by Vice-president Fillmore, who appointed Webster secretary of state. On July 17 Webster addressed the senate on the subjects connected with the compromise bill and the Wilmot proviso. This was his last speech in the senate. He delivered an eloquent address on July 4, 1851, at the laying of the corner stone of the extension of the capitol at Washington. His last important forensic argument was on the india rubber patent cause, at Trenton, N. J., in January, 1852. Among his later official acts was a celebrated despatch to Hülsemann, the Austrian *charge d'affaires*, occasioned by the revolt of the Hungarian patriots. This document was dated 1851.

In May, 1852, he was thrown from his carriage, and seriously injured, near Plymouth, Massachusetts, but he was afterward able to revisit Washington. After all his sacrifices and concessions to the proslavery party, he received in the national whig convention of 1852 only thirty-two votes, and those from northern men, although it was known that he wished to be nominated for the presidency. He died at Marshfield, Massachusetts, October 24, 1852, leaving one son, Fletcher. His other sons and daughters died before their father.

In stature Webster was tall, his head and brain were of great size, his eyes large, black, and lustrous. He was greatly distinguished for his conversational powers and genial temper in society. "To those," says Curtis, "who have known Mr. Webster only in public, it is difficult to give an idea of the genial affections which at every period of his life flowed out from him in the domestic circle, and still more difficult to paint the abounding gayety and humor and fascination of his early days." "He was," says another contemporary, in 1870, "the greatest orator that has ever lived in the western hemisphere. Less vehement than Calhoun, less persuasive than Clay, he was yet more grand and powerful than either."

"Mr. Webster," says Hallam, the great historian, "approaches as nearly to the beau-ideal of a republican senator as any man that I have ever seen in the course of my life; worthy of Rome or Venice, rather than of our noisy and wrangling generation."

ABRAHAM LINCOLN, American statesman, and sixteenth president of the United States, was born in a log cabin, in Hardin county, Kentucky, February 12, 1809. His father, Thomas Lincoln, was a Virginian, and married Nancy Hanks. While Abraham was yet an infant, the family removed to another log cabin not far distant, and in these two he spent the first seven years of his life.

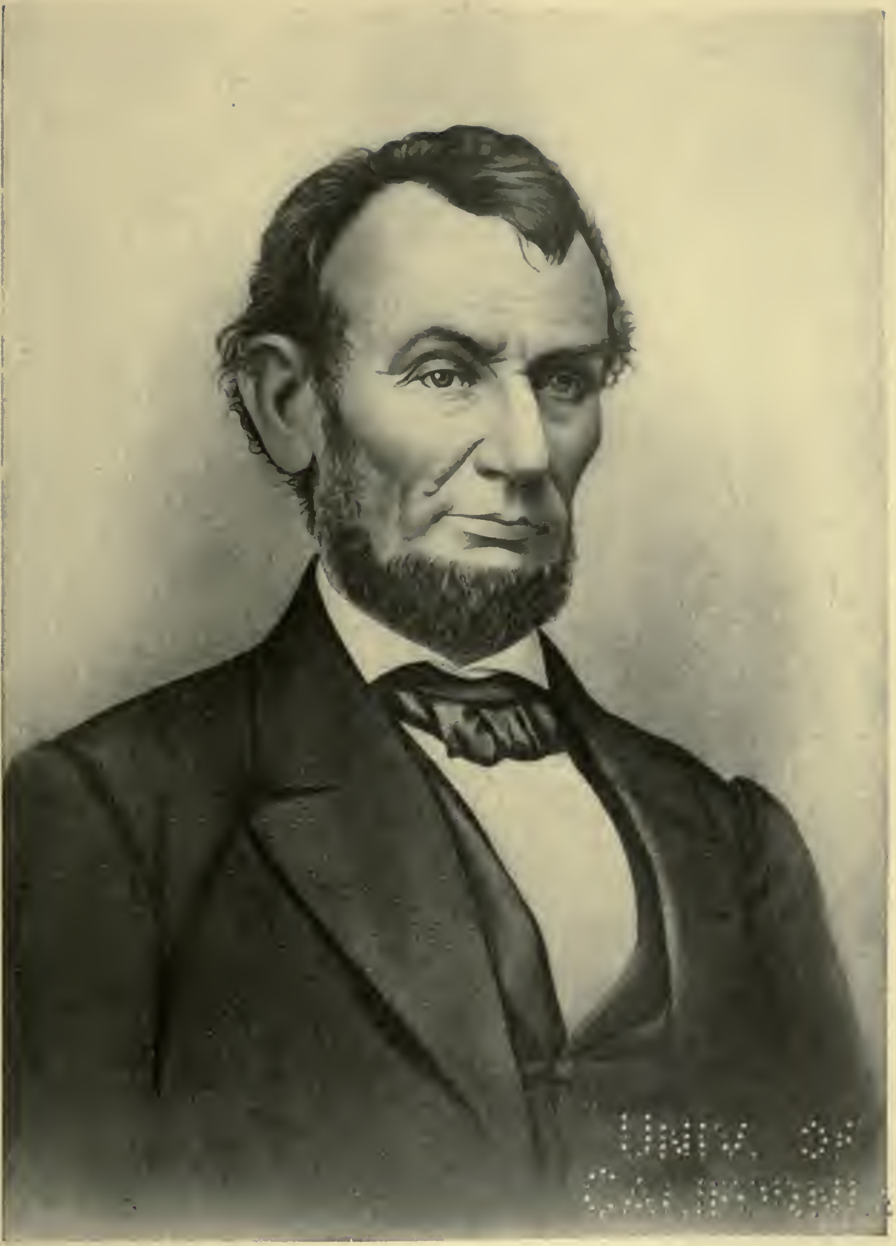
Lincoln's mother was a woman of great force of character, and passionately fond of reading. President Lincoln often said that his earliest recollections of his mother were of sitting at her feet, and listening to the tales and legends that she read. She was also a skillful hunter; with her rifle more than once she brought down the bear and the deer; with her hands she dressed the flesh and prepared it for the family table, and made garments for the family with the skins.

When Abraham Lincoln was in his seventh year, Zachariah Riney moved into the neighborhood and the lad was sent to school to him. Riney was a Catholic, however, and the Protestant children attending his humble school were withdrawn whenever any religious exercises were held. A little later he had the opportunity of being taught by Caleb Hazel for three months. Lincoln was a full-grown lad when he first saw a church; and his first notion of public speaking was taken from the itinerant preacher, Parson Elkin, who now and then passed their way.

Thomas Lincoln was of a somewhat unsettled nature, and, like many another pioneer, thought he saw better advantages further west. He listened to the wonderful tales of rich soil, abundant game, fine timber, and good pasturage, in Indiana, and he resolved to remove there. He found a newcomer who was willing to take his partly improved farm and log cabin in Kentucky for ten barrels of whiskey and twenty dollars in cash. Aided by some boys he built a flatboat and launched it upon Rolling Fork, which empties into the Ohio, loaded his ten barrels of whiskey, and heavier articles of furniture upon it, and floated off down the Ohio. But the frail craft upset, and with what little could be saved from the wreck Thomas Lincoln landed at Thompson's Ferry, and there found an oxcart to transport him with his slender stock of valuables to Spencer county, Indiana, about eighteen miles from the river.

The children, left at home with their mother, attended school and snared game for the family table. One bedticking filled with dried forest leaves sufficed for their rest at night, and early in the morning the future president was out chopping wood for the day's fire.

At last the father returned, and the long journey to Indiana was undertaken. At night they slept on the fragrant pine twigs, and by day they plodded on their way toward the Ohio river. By all sorts of expedients the little family contrived to get from one home to the other, where on a grassy knoll, in the heart of the untrodden forest, they fixed upon the site of their future dwelling. A hunter's camp was all that could be built to shelter them during their first winter. One side was entirely open except as it was screened with the half-dressed skins of wild animals. Thorns were used for pins in his home; bits of bone with cloth did duty for buttons; crusts of rye bread, well burned, were substituted for coffee; the dried leaves of sundry native herbs took the place of tea. Corn whiskey tempered with water was a common drink of the country, and one of the readiest forms of business currency. There were no neighbors to drop in with friendly gossip, no boats to vex the waters of the western rivers. Even when one of the settlers of that region knew how to write, it would



UNIV. OF
CALIFORNIA

ABRAHAM LINCOLN
From a painting

require months, sometimes, for his letter to reach the eastern world; and only as a faint echo now and then came a whisper of politics and national affairs.

James Madison was at this time president of the United States, and the country was greatly disturbed over the admission of Missouri, the extension of slavery, and other matters of great moment; but little or none of the excitement ever reached the log cabin. Through the winter Abraham Lincoln aided his father in felling logs for a more substantial cabin; and in the spring all the available neighbors were convened, the logs were rolled out of the woods, and one by one fitted into their places in the shape of four walls. Gables were fixed in position with wooden pins, and the log cabin was completed. The floor was the solid ground and the cracks between the logs were "chinked" with thin strips of wood. Little wonder that young "Abe" mastered the art of splitting rails, and imbibed a knowledge of woodcraft which clung to him forever!

During their first year in Indiana his mother was stricken down by hard work, exposure, and continual anxiety, and died on October 5, 1818. There were no funeral ceremonies, for there was no one to conduct them; but long afterward, when the spot where she lay was covered with the wreck of the forest, and almost hidden, her son was wont to say, "All that I am or hope to be, I owe to my mother."

Boys of the present age, turning languidly over the piles of books at their command, would wonder at the little stock that made Abraham Lincoln's heart glad in those times. His library consisted of the *Bible*, Æsop's *Fables*, and *Pilgrim's Progress*. On these three his literary tastes were formed. He read the books until he could repeat from memory many chapters of the Bible, the most striking passages of Bunyan's story, and every one of Æsop's fables. Then he secured a copy of the lives and characters of eminent men, and from the day when he first read the biography of the great Kentuckian, Lincoln dated his undying admiration for Henry Clay. Then he obtained Ramsay's *Life of Washington*, and hearing of another *Life of Washington*, written by Weems, he made a long journey to borrow it, and joyfully carried it home in the bosom of his hunting shirt. A storm at night washed through the chinks of the logs in the cabin, and damaged the book. With a heavy heart Lincoln carried the book back to Mr. Crawford, who had loaned it to him. He offered to do anything in settlement which Crawford might think fair and just, and it was finally agreed that "Abe" should "pull fodder" for three days.

"Does that pay for the book, or for the damage done to it?" asked the boy, taking his first lesson in worldly wisdom. Crawford "allowed" that he had considered the book practically worthless, and that the work paid for it, so that it became the first book that Abraham Lincoln purchased; and discolored and blistered though it was, it was to him of incalculable value.

In the autumn of 1819 Thomas Lincoln went off into Kentucky, leaving the children to take care of themselves; but in December he returned, bringing a new mother for them, and a store of what to the children of the wilderness seemed a gorgeous array of housekeeping utensils: a table, a bureau, chairs, crockery, knives, forks, and other incidentals which to-day are considered the necessaries of life, but which, until then, the Lincoln family lived without. The new mother and her stepson became fast friends from the start, and she said of him afterward, "He never gave me a cross word or look, and never refused in act or appearance to do anything that I requested of him." From this time matters began to look brighter for the Lincoln family. Neighbors became more abundant, and the school, with its coveted facilities for obtaining knowledge, was within reach.

At the age of seventeen an accident led Lincoln into the vicinity of Booneville. There, hearing that one of the famous Breckenridges of Kentucky was to speak for the defense in a murder trial, he went to Booneville, and in dumb wonder listened to the first important speech which he had ever heard. Lincoln could not restrain himself; and as the eminent lawyer passed out of the courthouse, he found himself interrupted by a tall, overgrown youth, awkward, horny-handed, and evidently of the poorer class, who timidly held out his hand to him. But the aristocratic Breckenridge stared in surprise at the intrusive stranger, and hastily passed without further notice the future president of the United States.

The boy had learned a grand lesson in oratory, however, and he was as grateful to

Breckenridge for it as he would have been had the great man been as gracious to him then as he was years afterward, when he was reminded by the president in Washington of the little incident in Booneville. From that moment Lincoln's enthusiasm for speechmaking knew no bounds. His father was at last obliged to interfere, and forbid his making speeches during work hours. The old man grumbled, "When Abe begins to speak, all hands stop work to hear him." In every sense of the word, at twenty years of age, Abraham Lincoln was a self-made man. What he had learned he had learned by himself; what he knew he knew with absolute accuracy. He was self-taught, self-dependent, self-reliant.

In the spring of 1830 the entire family made another move west, across the prairies to Illinois, near to the village of Decatur. The entire outfit consisted of one wagon drawn by four oxen and driven by Abraham Lincoln. When at last the family were well settled down upon the new ground, young Lincoln determined that it was time for him to strike out for himself. He was twenty-one years old and able and anxious to earn his own living. He therefore, about 1831, engaged himself with a party that was taking a flatboat loaded with produce down the river to New Orleans. Thus he visited the land of slavery, and saw its peculiar institutions, and thus he formed his first opinions of slavery. He succeeded so well with the cargo that the owner employed him to take charge of a country store at New Salem, Illinois, where he at once established himself as a great favorite.

Up to this time Lincoln had never held any office except that of an occasional clerk at an election; but in the spring of 1832 he found himself out of business, the store at New Salem having been closed, and he resolved to become a candidate for representative to the legislature. He was then a pronounced whig, following in the footsteps of his idol, Henry Clay. Before the election, however, there was a call for volunteers to repel the hostile Indians, during the Black Hawk war, and Lincoln was among the first to volunteer. At the head of a party of Sangamon county men, he made his way to General Atkinson's headquarters, where he was appointed captain of a company.

The campaign was short and decisive. Lincoln reached his home again with only ten days remaining in which to make his canvass for the seat in the legislature to which he aspired. He received a majority of the votes in his own precinct, but he lost the election. Having now no occupation, he borrowed every book on law that he could find, and began the study of law. He also amused himself and his neighbors by drawing up imaginary deeds, wills, and conveyances; and the neighbors soon began applying to him for advice and assistance in selling and mortgaging real estate. His fees were usually the necessities of life, turned over to the family with whom he boarded. Soon he was undertaking small cases for trial before the justices of the peace. An old judge said of him, that "When Lincoln argued, he inevitably gave the impression that he sincerely believed every word that he said." Surveying, too, occupied his leisure moments, and maps of land surveyed by Lincoln still show a neatness and semblance of accuracy that testified to the rigid care he exercised in all his work.

In 1833 Lincoln was appointed postmaster at New Salem. The revenues were small; and, as the popular saying ran, "Lincoln carried the post office in his hat." He said himself that he took the office on account of the weekly papers coming through the mail, which he scrupulously read before they were called for.

In 1834 he again became a candidate for the legislature. This time he was elected. He was now twenty-five years old. The capital was then at Vandalia. Clad in a suit of not especially elegant blue jeans, Lincoln, with his commanding height, was a marked figure in the legislature. During the first session he introduced few bills, but he narrowly observed what other men were doing in this direction; while he said little, he took in everything and thought a great deal.

In 1836 he was reëlected. In his appeal to his constituents he said, "I go for all sharing the privileges of the government who assist in bearing its burdens. I go for admitting all whites to the right of suffrage who pay taxes or bear arms, by no means excluding females." At this second session of the legislature he put himself on record for the first time as opposed to the further extension of the system of American slavery.

In 1837 Lincoln went to Springfield, the new capital of the state, where he established himself in the practice of law, and there he remained until his election to the presidency. He rode into town on a borrowed horse, all his earthly possessions packed in a pair of saddlebags fastened to the crupper of his saddle. He wanted to hire a room, and furnish it with the barest necessities, but found that the aggregate cost of these was seventeen dollars. To the storekeeper Lincoln sadly said, "It is cheap enough, but cheap as it is, I have not the money to pay for it. If you will give me credit until Christmas, and my experiment here is a success, I will pay you then. If I fail, I shall probably never be able to pay you." The storekeeper, somewhat impressed, replied that he had a large double bed in his own room, which Lincoln was welcome to share with him if he chose; and thus he settled in his new quarters at the capital of Illinois.

In April, 1837, Lincoln formed a partnership with John T. Stuart, of Springfield, which continued until 1841, when he associated himself with Stephen T. Logan. In November, 1842, he married Miss Mary Todd, daughter of Robert S. Todd, Esq., of Lexington, Kentucky. In 1843 the law firm of Abraham Lincoln and William H. Herndon was formed, and the copartnership was not dissolved until the death of Lincoln in 1865.

As a lawyer, Lincoln proved the value of those qualities which had won for him the title of "Honest Abe" when he was a storekeeper. In 1839 there was a remarkable debate in the Illinois legislature in which Stephen A. Douglas, John Calhoun, Josiah Lamborn, and Jesse B. Thomas were upon one side, and Stephen T. Logan, Edward D. Barker, Orville H. Browning, and Abraham Lincoln upon the other side. During the debate one of the speakers taunted the other side upon the hopelessness of its case and the fewness of its numbers. In replying Lincoln said, "Address that argument to cowards and knaves. It may be true; if it is, let it be. Many free countries have lost their liberties, and ours may lose hers. But if she shall, let it be my proudest plume not that I was the last to desert her, but that I never deserted her."

Lincoln had long desired to go to congress; but it so happened that all his best friends were equally anxious to go, and from the same district. On one occasion, having himself been a candidate for nomination, Lincoln was elected as a delegate to the nominating convention, and was instructed to vote for Baker. Of the predicament he good-naturedly said, "I am fixed like the fellow who was made groomsman to the man who cut him out and was marrying the girl." The greatest political disappointment of his life, however, was when his idol, Henry Clay, was defeated, and James K. Polk was elected in 1844. For once, Lincoln's political expectations were overwhelmed.

In 1846 Lincoln was at last nominated for congress, and carried the election by a most unusual majority. He took his seat December 6, 1847. One of his first acts in congress was a masterly speech reviewing the causes of the Mexican war, and severely arraigning the administration for its persistence in the matter of annexing Texas, and thus involving the country. On January 16, 1849, he introduced a bill for abolishing slavery in the District of Columbia and compensating the slave owners, provided a majority of the citizens should vote in favor of it. He declined to be a candidate for reëlection.

The repeal of the Missouri compromise brought him again into the political arena, and he became the acknowledged leader of his party in Illinois. In 1854 he several times met Douglas in debate, and on one of these occasions — Springfield, October 4th — he made one of the most successful speeches of his whole life; the fallacy of Douglas's "great principle" was effectually exposed in a single sentence: "I admit that the emigrant to Kansas and Nebraska is competent to govern himself, but I deny his right to govern any other person without that person's consent."

In June, 1858, the republican convention at Springfield nominated Lincoln for United States senator in place of Stephen A. Douglas, who was a candidate for reëlection. In accepting the nomination he delivered a carefully prepared speech, in which he said: "'A house divided against itself cannot stand.' I believe this government cannot endure permanently half slave and half free. I do not expect the Union to be dissolved, I do not expect the house to fall, but I do expect it will cease to be divided." This became famous as the "house-divided-against-itself speech."

He and Douglas canvassed the state together, speaking in joint debate seven times. The main question under discussion was whether Kansas should be admitted to the Union as a free state or as a slave state;

the struggle was at its height, the Dred Scott decision had intensified public interest, and the debate drew the attention of the whole country. Douglas's continual assumptions of superiority and sneers at his antagonist's early poverty and occupations were met with humorous retorts and sharp exposures of sophistry; and Lincoln finally drove him to the necessity of taking ground against the Dred Scott decision, which ultimately prevented his harmonious nomination by the democratic party, and consequently his elevation to the presidency.

On the popular vote Lincoln had a plurality of more than four thousand over Douglas; but the legislative districts were so arranged that the democrats returned a majority of eight members, and Douglas was reëlected. The republican national convention met in Chicago on May 16, 1860, however, adopted a platform on the 17th, which denied "the authority of congress, of a territorial legislature, or of any individuals to give legal existence to slavery in any territory of the United States," and on the 18th, on the third ballot, nominated Lincoln for president. His chief competitor in the convention was William H. Seward. Hannibal Hamlin was nominated for vice-president. The election resulted in the success of Lincoln and Hamlin.

Before Lincoln's inauguration seven states formally seceded from the Union, and there was danger that seven others would follow them, four of which ultimately did. He was inaugurated on March 4, 1861, and delivered a long address, in which he said: "I hold that, in contemplation of universal law and of the constitution, the union of these states is perpetual. * * * The power confided to me will be used to hold, occupy, and possess the property and places belonging to the government, and to collect the duties and imposts; but beyond what may be necessary for these objects there will be no invasion. * * * In your hands, my dissatisfied fellow countrymen, and not in mine, is the momentous issue of civil war."

During the preceding administration large quantities of arms and ammunition had been removed from the national arsenals in the north to those in the south; the army, only sixteen thousand strong, had been sent to remote parts of the country; the navy had been scattered in distant seas; the treasury was empty; and the border states, heartily sympathizing with the southern, but unwilling to stand between two hostile powers, constituted the most uncertain element in the novel problem. On March 13th Messrs. Forsyth and Crawford, as "commissioners from a government composed of seven states which had withdrawn from the American Union," signified their desire to enter upon negotiations for the adjustment of questions growing out of the separation; but the secretary of state, Seward, by direction of the president, declined to receive them, as "it could not be admitted that the states referred to had, in law or fact, withdrawn from the federal Union, or that they could do so in any other manner than with the consent and concert of the people of the United States, to be given through a national convention."

The delivery of this communication was withheld, by consent of the commissioners, until April 8th, when it was speedily followed by the bombardment of Fort Sumter, which precipitated the civil war. On April 15th President Lincoln called out the militia of the several states to the number of seventy-five thousand; on the 19th he proclaimed a blockade of the ports in all the seceded states; on May 3d he called for forty-two thousand three-years' volunteers. An extra session of congress was called to meet on July 4th. On account of the withdrawal of the southern members, the republicans had a large majority in each house. Congress promptly passed bills ratifying the acts of the president, authorizing him to accept five hundred thousand volunteers, placing five hundred million dollars at the disposal of the administration, and confiscating all slaves used in military operations against the government.

The president had suspended the writ of habeas corpus on May 3, 1861, in an order addressed to the commander of the forces on the Florida coast. On the 27th of the same month, General Cadwalader, being authorized by the president, refused to obey a writ issued by Chief Justice Taney for the release of a Maryland secessionist imprisoned in Fort McHenry. The chief justice then read an opinion that the president could not suspend the writ, and most of the journals opposed to the administration violently assailed its action; whereupon some of them were refused transmission in the mails, and at the same time restrictions were placed upon the use of the telegraph. Congress passed an act — December, 1861 — approving the action of the president, and authorizing the suspension of the writ so long as he should deem it necessary.

To prevent the border states from joining the confederacy was still the most difficult portion of the president's task, and in pursuance of this object he steadily resisted appeals for a general emancipation. On August 22, 1862, in reply to an open letter addressed to him by Horace Greeley, Lincoln wrote: "My paramount object is to save the Union, and not either to save or destroy slavery. If I could save the Union without freeing any slave, I would do it; if I could save it by freeing all the slaves, I would do it; and if I could do it by freeing some and leaving others alone, I would also do that." Meanwhile he prepared a declaration that on January 1, 1863, the slaves in all states or parts of states which should then be in rebellion would be proclaimed free. This was put forth September 22, 1862, five days after the battle of Antietam, and the promised proclamation was published on January 1, 1863.

After General McClellan assumed command of the army of the Potomac, six months passed and no active operations had been set on foot. The president then — January, 1862 — ordered a general movement of the land and naval forces against the enemy, to begin on February 22d, and specifically ordered General McClellan to organize an expedition for seizing a point on the railroad southwest of Manassas Junction. The general protested, had several conferences with the president, and urged his own plan of a movement against Richmond up the peninsula, to which Lincoln finally assented after a council of twelve general officers had decided, eight to four, in favor of it; and during the months of delay which followed he constantly urged a rapid forward movement. This did not take place, and the campaign failed.

After the battle of Antietam — September 16-17, 1862 — Lincoln again urged McClellan to follow the retreating confederates across the Potomac and advance upon Richmond. A most extraordinary correspondence ensued, in which the president set forth with great clearness the conditions of the military problem and the advantages that would attend a prompt movement by interior lines toward the confederate capital. Tired at length of McClellan's varied excuses for delay, he removed him from command on November 7, 1862, and appointed General Burnside in his place. The military operations of 1862 elsewhere than in Virginia were nearly all successful.

Charles Francis Adams, United States minister at London, found it impossible to induce the British government to stop the fitting out of confederate privateers in English ports. When the No. 290, afterward famous as the *Alabama*, escaped from the yard of the Messrs. Laird at Birkenhead — July, 1862 — the British government was notified that the United States would hold it responsible for whatever damage the vessel might inflict on American commerce.

The battle of Gettysburg, July 1-3, 1863, was the turning point of the war. At the dedication of the cemetery in which the slain of this battle were buried — November 19, 1863 — President Lincoln made the brief address which has become famous. In the autumn elections of 1862, many states had given majorities for the party opposed to the administration; in those of 1863, every state except New Jersey was carried by its friends. The request of the French government that the United States would recognize the government of Maximilian in Mexico was steadily refused. On October 16, 1863, the president had called for three hundred thousand volunteers, to take the place of those whose term was about to expire; on March 15, 1864, he called for two hundred thousand more, to supply the navy and provide a reserve for contingencies. In April the governors of Ohio, Indiana, Illinois, Iowa, and Wisconsin offered the government a force of one hundred thousand men for one hundred days' service; this offer was accepted.

The national republican convention, June 8, 1864, renominated Lincoln, with Andrew Johnson for vice-president. The democratic convention, August 29, nominated General McClellan for president and George H. Pendleton for vice-president. The essential portion of the platform was the following resolution:

"That this convention does explicitly declare, as the sense of the American people, that, after four years of failure to restore the Union by the experiment of war, during which, under the pretense of a military necessity, of a war power higher than the constitution, the constitution itself has been disregarded in every part, and public liberty and private rights alike trodden down, and the material prosperity of the country essentially impaired, justice, humanity, liberty, and the public welfare demand that immediate efforts be made for a cessation of hostilities, with a view to an ultimate convention of all the states, or other peaceable means to the end that at the earliest practicable moment peace may be restored on the basis of the federal union of the states."

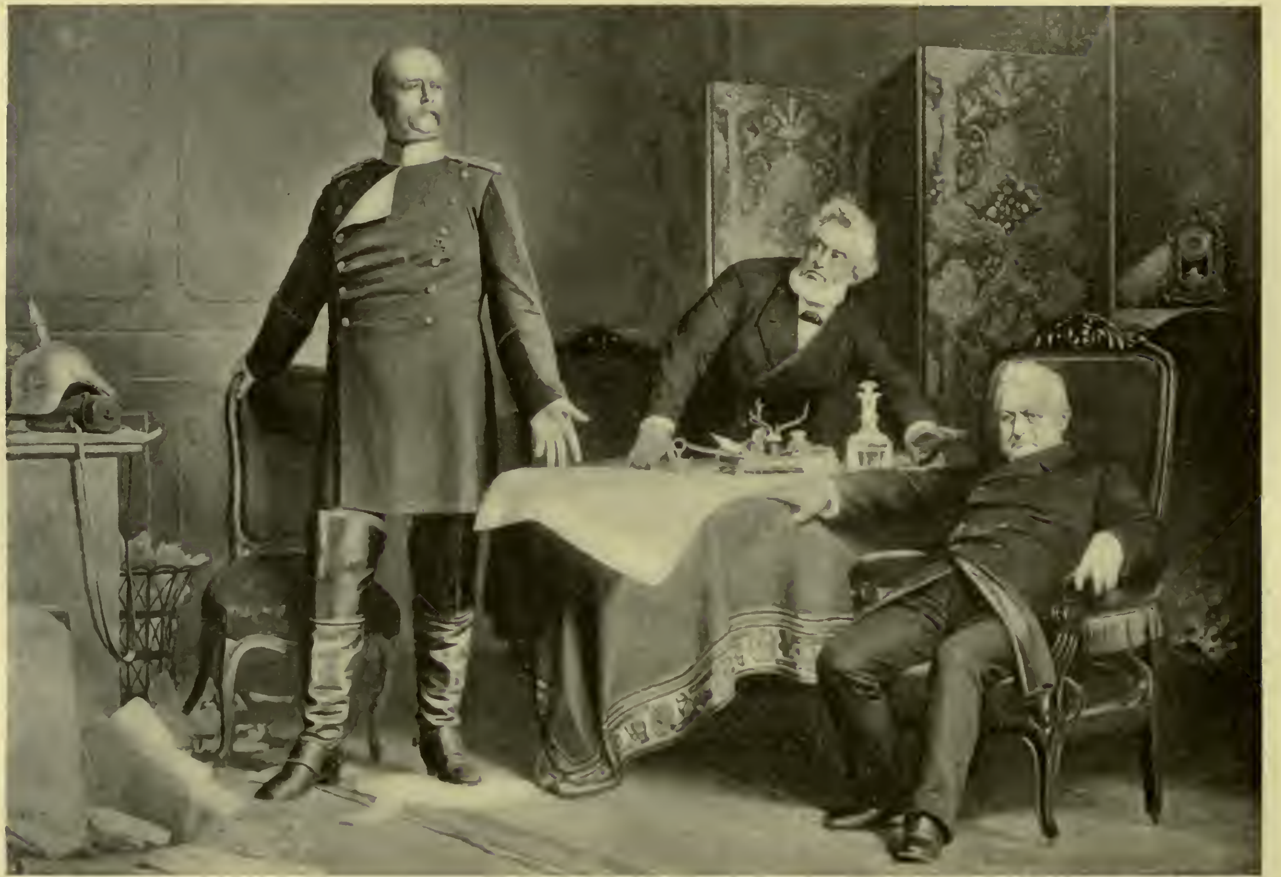
The issue thus squarely presented was maintained throughout the canvass, and the election was looked to for a popular verdict whether the war should be continued. Sherman captured Atlanta on September 1st. During September and October General Sheridan, by several brilliant victories, swept the Shenandoah valley clean of the confederate forces that had occupied it under Early. Hood was defeated in all his operations against Sherman's communications, and finally dashed himself to pieces against the defenses of Nashville. The early state elections in Maine, Vermont, Pennsylvania, Ohio, and Indiana were carried by the republicans, and Maryland, by a close vote, adopted a new constitution forbidding slavery. The presidential election was the quietest ever known. The total number of electoral votes counted was two hundred thirty-three, of which Lincoln and Johnson received two hundred twelve, McClellan and Pendleton twenty-one.

As the call of July 18th had been largely filled by the application of credits for men previously enlisted, the president on December 19th called for two hundred thousand more. Sherman completed his grand march through Georgia in time to present the government with the city of Savannah "as a Christmas gift"; Grant's lines were extended further around Petersburg, cutting off the Weldon railroad; and in January, 1865, Fort Fisher, commanding the harbor of Wilmington, where blockade-running had been most successful, was captured. On February 3d, President Lincoln and Secretary Seward held an informal conference with Alexander H. Stephens, R. M. T. Hunter, and J. A. Campbell, on a gunboat in Hampton Roads; but no result was reached, as the president insisted upon three things: (1) restoration of the national authority throughout all the states; (2) no receding from the position of the national executive on the subject of slavery; (3) no cessation of hostilities short of an end of the war and the disbanding of the forces hostile to the government.

Lincoln's second inaugural address closed with this now famous passage: "With malice toward none, with charity for all, with firmness in the right as God gives us to see the right, let us finish the work we are in, to bind up the nation's wounds, to care for him who shall have borne the battle, and for his widow and his orphans, to do all which may achieve and cherish a just and a lasting peace among ourselves and with all nations." The confederates having attempted on March 3d to open peace negotiations with General Grant, the president instructed him to have no conference with General Lee unless it should be for the capitulation of Lee's army, forbidding him to decide, discuss, or confer upon any political question. On the day after the evacuation of Richmond the president entered it, accompanied only by his son and Admiral Porter and a few sailors.

On the evening of Good Friday, April 14, 1865, he visited Ford's theater, accompanied by Mrs. Lincoln and two or three personal friends. A few minutes past ten o'clock an obscure actor, John Wilkes Booth, entered the box, having first barred the passage leading to it, approached the president from behind, placed a pistol close to his head, and fired. He then leaped from the front of the box upon the stage, brandishing a dagger, and shouted, "sic semper tyrannis! The South is avenged!" He then disappeared behind the scenes, passed out at the stage door, and escaped. The president was removed to a private house on the opposite side of the street, where he died at twenty-two minutes past seven o'clock the next morning.

At the same hour when the president was shot, Secretary Seward was attacked in his house; and it became known that an elaborate plot had been formed for murdering simultaneously nearly all the chief civil officers of the government. For this conspiracy eight persons were tried by a military commission, and four of them — including a woman — were executed, while three were sentenced to hard labor on the Dry Tortugas for life, and one for six years; one died there, and the other three were pardoned by President Johnson. Lincoln's remains were buried at Oak Ridge cemetery, near Springfield, Illinois, on May 4th. On October 15, 1874, they were removed to an elaborate tomb



BISMARCK FAVRE THIERS

BISMARCK AT VERSAILLES

From the painting of Carl Wagner

surmounted by a statue of Lincoln, an obelisk, and four symbolical figures. A colossal bronze statue, erected by contributions of colored people, was unveiled in Lincoln park, Washington, in 1876.

At the funeral services held in honor of Lincoln at Concord, Massachusetts, Emerson spoke of him as follows:

"A plain man of the people, an extraordinary fortune attended him. Lord Bacon says, 'Manifest virtues procure reputation; occult ones, fortune.' He offered no shining qualities at the first encounter; he did not offend by superiority. He had a face and manner which disarmed suspicion, which inspired confidence, which confirmed good will. He was a man without vices. He had a strong sense of duty, which it was very easy for him to obey. Then he had what farmers call a 'long head'; was excellent in working out the sum for himself — in arguing his case and convincing you fairly and firmly. * * * He had a vast good nature, which made him tolerant and accessible to all. * * * Then his broad good humor, running easily into jocular talk, in which he delighted and in which he excelled, was a rich gift to this wise man. It enabled him to keep his secret, to meet every kind of man, and every rank in society, * * * to mask his own purpose and sound his companion, and to catch with true instinct the temper of every company he addressed. *His occupying the chair of state was a triumph of the good sense of mankind and of the public conscience.* This middle-class country had a middle-class president at last. Yes, in manners and sympathies, but not in powers; for his powers were superior. This man grew according to the need; his mind mastered the problem of the day; and as the problem grew, so did his comprehension of it. Rarely was a man so fitted to the event. * * * It cannot be said that there is any exaggeration of his worth. If ever a man was fairly tested, he was. There was no lack of resistance, nor of slander, nor of ridicule. * * * Then what an occasion was the whirlwind of the war! Here was place for no holiday magistrate, no fair-weather sailor; the new pilot was hurried to the helm in a tornado. In four years — four years of battle-days — his endurance, his fertility of resources, his magnanimity, were sorely tried and never found wanting. There, by his courage, his justice, his even temper, his fertile counsel, his humanity, he stood a heroic figure in the center of a heroic epoch. He is the true history of the American people in his time — the true representative of this continent — father of his country, the pulse of twenty millions throbbing in his heart, the thought of their minds articulated by his tongue."

OTTO EDUARD LEOPOLD VON BISMARCK-SCHÖNHAUSEN, familiarly known as Prince Bismarck, famous Prussian statesman, and the creator of German unity, was born at Schönhausen, Prussia, April 1, 1815. He was descended from a noble Brandenburg family, whose members had aided the fortunes of the house of Hohenzollern as soldiers and diplomatists. His own father lived quietly on the hereditary estates at Schönhausen and in Pomerania; the force and genius of the son seemed to come from his mother, Luise von Menken, an earnestly religious and highly educated daughter of a statesman.

Otto was placed at the age of six in a private school in Berlin, and at twelve entered the Friedrich Wilhelm gymnasium there. His mother looked after his early education, and had him learn French and

English well, having already marked him for a diplomatist. His father inured him to hardy field sports and stimulated a vigorous and healthy physical development and a love of nature. As a schoolboy, he was dutiful and studious. The hardest lessons cost him no great effort, and in no degree damped his redundant vitality.

From the Berlin gymnasium he went to the university of Göttingen in 1832, where his exuberant animal spirits flourished in the congenial nidus of the aristocratic student corps. Tall and powerfully built, with a constitution of iron, he plunged gayly and recklessly into the excesses of student life, and became the deepest drinker, the readiest swordsman, so wild in his behavior, the author of such extravagant pranks, that he earned for himself the sobriquet of "mad Bismarck."

This rollicking, carousing, fighting manner of living did not, however, half fill up the measure of his academic existence at Göttingen and afterward at Berlin. He was a companion of the serious and intellectual students as well as of the careless spendthrifts of the nobility. With John Lothrop Motley, then a student at Göttingen and afterward the famous American historian of the Dutch republic, for instance, he formed a lifelong friendship. He attended lectures and applied himself to the routine studies well enough to pass a creditable examination; he delved deep in the study of history and developed into a political thinker of independent views strongly held.

At the age of twenty he obtained his degree in jurisprudence and was sworn in as *auscultator*, or examiner, in the Berlin law courts. The next year he entered the army. The future German emperor, then Prince Wilhelm, remarked his stalwart form, the picture of a guardsman, when he was presented at the palace. An example of his audacious wit was relished by other young subordinates of the judicial hierarchy. When the trial judge rebuked him for infringing on his own authority by threatening to pitch out a recalcitrant witness, he retorted a few minutes later by telling the same witness that if he did not answer properly he would have the judge pitch him out.

The wearisome drudgery and routine, the rigid formalities and humble subservience of Prussian officialism, could not fetter long his restless spirit. He learned to detest the town and all the conditions of official life. In the barracks of the Jäger guards, with whom he performed his military duties, he was more at home, and most of all among the hunting, fighting, drinking nobility of the Alt Mark and Pomerania, who at least led a fresh, untrammeled existence. In sportsmanship and daring and in dissipation and wild escapades he outlived them all, and he was glad enough to quit his petty office in 1839 and take up the free and unsophisticated life of a country nobleman and agriculturist. His help was needed at home, as his father had been a careless financier and a poor farmer, and was in sadly embarrassed circumstances.

Young Bismarck, applying himself faithfully to the task before him, developed the shrewd business tact and knowledge of men that worked his success later as a diplomatist, the provident calculation and discriminating enterprise that enabled him to control the finances of a nation, the habit of organizing, schooling, and commanding others that gave him his unquestioned and self-reliant authority as the chief of a government. Withal, he acquired a practical knowledge of farming, of soils and crops, planting, fertilizing, draining, which in time, after the Schönhausen property had fallen to his share by inheritance, in 1845, freed the estate from debt and gave him a comfortable income.

When his cares were lifted and the people whom he had trained could manage without his watchful supervision, his restless spirit once more preyed upon itself, and to escape weariness he plunged into dissipation, sought an anodyne in deep potations of brown beer and champagne, tried violent athletic exercises as a relief from *ennui*, and indulged to the full in the pleasures and society of the roistering young nobles of the Mark, galloping from castle to castle in tumult of mind like the "Wild Huntsman."

His torrential passions suddenly turned into their right channel again, and his impetuous yearnings found a rightful object when he fell in love with the accomplished and pious Johanna von Puttkamer. Her parents had no intention or desire to bestow her on the "mad Bismarck," but when he had wrung from her a confession of love he went to them with dauntless assurance, and, clasping his beloved in his arms, announced solemnly that whom God had joined no man should put asunder.

Journeying through Switzerland and Italy on the wedding trip, in the autumn of 1847, the young Brandenburger happened in Venice at the same time as his hereditary liege, Friedrich Wilhelm IV., who asked him to dinner, and was much impressed with the political views and theories that Bismarck boldly and wittily expounded. The young officers and squires, his former boon companions, had been dreadfully bored by such political monologues over the bottle, but the king of Prussia formed a high opinion of the talents revealed in Bismarck's conversation, and thus by haphazard he was a man marked out for his sovereign's favor before he had set his foot on the political ladder.

Before 1847 Bismarck was little heard of politically; but about that time be began to attract attention in the new Prussian diet, to which he had been elected, as an ultra-royalist, and a fierce but unsuccessful opponent of the constitutional demands resulting from the March revolution of 1848. In 1849 he was elected to the second chamber of the diet. He opposed the scheme of a German empire as proposed by the Frankfort parliament of that year, for the reason that the title to the imperial dignity offered to the king of Prussia was based merely on the popular will and not on the concurrent assent of the German sovereigns as well. His diplomatic career commenced in 1851, when he was appointed Prussian member of the resuscitated Germanic diet at Frankfort.

Here he began to manifest that zeal for the interests and aggrandizement of Prussia, which undeviatingly guided him afterward, often regardless of means. In the diet he gave open expression to the long-felt discontent with the predominance of Austria, and demanded equal rights for Prussia. At Frankfort he remained until 1859, when he beheld in the approach of the Italian war an opportunity of freeing Prussia and Germany from the injurious dominance of Austria. His views of energetic action, however, were not yet shared by the cautious and pacific prince regent, and Bismarck was recalled in that year from the diet and sent as minister to St. Petersburg.

In the spring of 1862 King William, on the urgent advice of the prince of Hohenzollern, transferred Bismarck as ambassador to Paris, in order to give him an insight into the politics of the Tuileries before intrusting him with the direction of affairs at home. During his short stay at Paris, Bismarck visited London, and had interviews with the leading politicians of the time, including Lord Palmerston and Disraeli.

In autumn, when the king's government could not obtain the consent of the lower house to the new military organization, Bismarck was recalled to take the portfolio of the ministry for foreign affairs, and the presidency of the cabinet. Not being able to pass the reorganization bill and the budget, he closed the chambers in October, 1862, and announced to the deputies that the king's government would be obliged to do without their sanction. Accordingly, the army reorganization went on; and the next four sessions of the diet were closed or dissolved in the same way, without the government obtaining, or even caring to obtain, the sanction of the house.

When the "conflict era," as it was called, approached a crisis, the death of the king of Denmark reopened the Schleswig-Holstein question, and excited a fever of national German feeling, which Bismarck was adroit enough to work so as to aggrandize Prussia by the acquisition of the Elba duchies, and reconcile his opponents to his high-handed policy by pointing to the success of the newly-modeled army. Throughout the events which ended in the humiliation of Austria at the battle of Königgrätz in 1866, and the reorganization of Germany under the leadership of Prussia — under the name of the North German confederation — Bismarck was the guiding spirit and logically became chancellor in 1867. Such was the magic of his success, that, from being universally disliked, he now became the most popular man in Germany. It was Bismarck, indeed, who negotiated the neutralization of the Luxemburg territory in 1867.

The action of France in regard to the candidature of Prince Leopold of Hohenzollern for the throne of Spain gave Bismarck the opportunity of carrying into action the intensified feeling of unity among the Germans. During the Franco-German war of 1870-71, Bismarck was the spokesman of Germany; he it was that in February, 1871, dictated the terms of peace to France. Having been made a count in 1866, he was now created a prince.

Following the peace of Frankfort, May 10, 1871, Bismarck became the first chancellor of the united German empire. The sole aim of his policy, domestic and foreign, was to consolidate the young empire of his own creating, by rendering its institutions more beneficent, authoritative, homogeneous, and stable, and again by securing it, through alliances and political combinations, against attack from without. Thus, conceiving the unity of the nation and the authority of its government to be endangered by the church of Rome, and its doctrines of papal infallibility, he embarked on a long and bitter struggle with the vatican, in the course of which the imperial and Prussian parliaments passed a series of most stringent measures — known as the Falk or May laws — against the Catholic hierarchy.

But Bismarck had underrated the resisting power of the Roman church, and motives of political expediency gradually led him to modify or repeal the most oppressive of the antipapal edicts, leaving the Catholics virtual masters of the field. Otherwise his domestic policy was marked, among other things, by a reformed coinage, a codification of law, a nationalization of the Prussian railways — as a preliminary step to imperial state lines — fiscal reform in the direction of making the empire self-supporting, repeated increase of the army and the regular voting of its estimates for seven years at a time, or the military septennate, the introduction of a protective tariff, in 1879, and the attempt to combat social democracy and its attendant evils by means at once repressive and remedial — among the latter being a lightening of the burden of direct taxation, the insurance of working men against suffering from accidents, indigence, and old age, with other economic experiments, which have caused Bismarck to be called the greatest state socialist of his age. With a view to improve the finances of the empire, Bismarck repeatedly tried to establish various government monopolies, but without success.

Bismarck also inaugurated the career of Germany as a colonizing power, a new departure which brought him into sharp but temporary conflict with the English of Gladstone. For the rest, his foreign policy mainly aimed at isolating France and rendering her incapable of forming anti-German alliances. On the other hand, he gradually combined the central powers of Europe into a peace-league — known as the triple alliance — whose purpose was to counteract the aggressiveness of Russia and France, separately or combined, on the Danube or the Rhine. The nucleus of this peace league was formed in 1879 by the Austro-German treaty of alliance — published February, 1888 — which Italy formally called the "peace-maker," and the "peace-keeper" of Europe, a character Bismarck first publicly acquired when, as "honest broker" between Austria and Russia, he presided over the Berlin congress in 1878. The phrase, "man of blood and iron," is based on "the iron chancellor's" own use of the words in a speech in 1862.

Bismarck's life was often threatened, and twice actually attempted — once in Berlin in 1866, just before the Bohemian campaign, by Ferdinand Cohen (or Blind), a crazy youth who aimed at making himself the instrument of popular dissatisfaction with Bismarck, as the champion of absolutism and the fancied apostle of a fratricidal war; and again in 1874, at Kissingen, by a tinsmith named Kullmann, who was unquestionably a product of ultramontane fury engendered by the May laws. When in 1885 Bismarck's seventieth birthday was celebrated as a great national event, he was still a marvel of mental vigor and bodily strength — the recipient of all the honors which his sovereign could bestow.

As a statesman he was imperious yet prudent, jealous, vindictive, and even unscrupulous — faults that sprang from his fervid patriotism; but in private life he could be genial, witty, and entertaining. In his public speeches he wielded the mother tongue with trenchant vigor.

Disapproving, in some respects, the policy adopted by Emperor Wilhelm II., Bismarck resigned the chancellorship in March, 1890. When his resignation was announced, many persons hastily assumed that it was the outcome of a serious misunderstanding with his sovereign on economic and socialist questions. Those who came to that conclusion had not followed with any care his attitude to the pressing problem of the hour. Had he been seriously opposed to the action of the emperor in calling together the labor conference, he would, of course, have resigned when his imperial master decided to summon it.

The truth is that very soon after the accession of Wilhelm II., differences arose between the young monarch and the chancellor. The leading idea of Bismarck always was to maintain thoroughly good relations with Russia. This was one of his chief differences with the emperor Frederick and also with the most powerful members of the Prussian staff. The present emperor was a warm partisan of the triple alliance, but Bismarck, while equally anxious to preserve that combination, attached more importance than his sovereign to the necessity of bringing about an arrangement between Austria and Russia on such a basis as would secure the interests of each power in the Balkan peninsula. Moreover, the chancellor always looked with cold suspicion on the colonial policy which had the sympathy of the emperor.

Although Wilhelm I. did not always take the same view of things as his great minister, he never took any important step without telling Prince Bismarck beforehand. Wilhelm II. did not observe this rule so punctiliously. Prince Bismarck thought he had some right to complain of the action of his sovereign in this respect. Considering the services, experience, and fame of the great minister, it was not to be expected that he would consent to be responsible for acts about which he had not been previously consulted, and the consequences of which might be most momentous. So the rupture came.

Subsequently, Bismarck spent the remaining years of his life at Friedrichsruh and Varzin, not in dignified quiet, but in a state of anger toward the emperor and his new chancellor. He endeavored to inflame the country, which was indignant at his summary dismissal. He denounced the policy of the government to the thousands who flocked to pay him homage wherever he went. In his organ, the *Hamburger Nachrichten*, and in other newspapers inspired by him, he criticised and belittled the new government and the men who composed it, and published the secret treaty with Russia at the risk of being prosecuted for revealing state secrets. He constantly dwelt on the necessity of a good understanding with Russia for the future security of Germany. He lent his name and influence to agrarian agitators and other malcontents. When he went to Vienna in 1892 to attend his son's wedding, the emperor Franz Josef denied him an audience, and the German ambassador ignored him. However, in 1894 a formal reconciliation took place between him and Wilhelm II. His death occurred at Friedrichsruh, July 30, 1898. After his death Dr. Moritz Busch published a volume of his table talk containing many frank disclosures. Bismarck also left manuscript memoirs of his life.

In stature Bismarck was tall and of an imposing presence. He had a piercing eye, and his countenance was expressive of great energy. He was always a lover of nature, delighting in agriculture, and, until prevented by failing health in his latter years, he was a bold rider and huntsman. The letters which were written at various times to members of his family reveal a nature of the most extraordinary richness. His marvelous descriptions of landscapes in Sweden, in Hungary, in France, in Spain, show him to be a nature enthusiast and he speaks of the sea in language which recalls some of the finest passages in Victor Hugo.

But the strongest of all Bismarck's personal characteristics was his firm, unshaken, and deep sense of his duty to the Almighty. At the height of the Franco-German war he said: "Did I not believe in a divine ordinance which has destined this German nation for good and great things, I would have never taken up my calling. To my steadfast faith alone I owe the power of resisting all manner of absurdities which I have shown during the past ten years. Rob me of my faith and you rob me of my country. Find me a successor animated by similar principles and I will resign on the spot."

Bismarck's greatness lies not only in his diplomatic genius and his energy, but in his moderation. He created the new Germany; he knew how to preserve it, and how to secure its future by antagonizing that domestic enemy, destructive liberalism. He had many admirers, but possessed very few intimate friends, though he could be very amiable. Like other great men, of similar temperament, he stood alone.

"To the posterity of a hundred years hence," says Charles Lowe, "Martin Luther and Prince Bismarck will undoubtedly be regarded as the Castor and Pollux of German history; and it is a remarkable coincidence that each of these greatest heroes of the German nation made his début, so to speak, as European actors on the very same obscure provincial stage. It was in the university library of Erfurt that Luther first discovered the Bible, while it was in the church of the Augustines that he was consecrated and read his first mass; and it was in this identical church of the Augustines that Herr von Bismarck, as a member of the futile union parliament of 1850, first gave indication to his countrymen of how national unity could, or rather could not, be attained."

FROM THE EARLIEST TIMES DOWN TO THE TWENTIETH CENTURY

THROUGHOUT THE WORLD

Abbas I. (*äb-bäs'* or *äb'-bäs*), **the Great**, shah or king of Persia, born in 1557; obtained the throne in 1586, at a time when the Turks and hordes of Usbek Tartars had made great encroachments on the country. He defeated the Usbeks, recovered the provinces overrun by them, and reduced a great part of Afghanistan. He then made war against the Turks, and in 1605 defeated them near Bussorah, thus getting back all the lost provinces. He extended his rule beyond Persia proper, and at his death in 1628 his dominions stretched from the Tigris to the Indus. He is regarded by the Persians as their greatest sovereign.

Abbe (*ăb'-ē*), **Cleveland**, meteorologist, was born in New York in 1838. He was graduated from college of city of New York in 1857; Ph. D., 1891; LL.D., university of Michigan, 1888; university of Glasgow, Scotland, 1896; B. S., Harvard, 1864; assistant professor Michigan agricultural college, 1859; tutor university of Michigan, 1859-60; aide in U. S. coast and geodetic survey, 1860–64; studied at Nicholas Central observatory, Poulkova, near St. Petersburg, Russia, 1864–66; aide U. S. naval observatory, 1867-68; director Cincinnati observatory, 1868–73; since 1891 meteorologist U. S. weather bureau. Editor *Monthly Weather Review*, 1873 and 1892–1909. Professor meteorology, Columbian (now George Washington) university, since 1886. Lecturer on meteorology, Johns Hopkins university, since 1896. Member national academy of sciences and many other scientific societies, domestic and foreign. Author: *Preliminary Studies in Storm and Weather Prediction; The Mechanics of the Earth's Atmosphere; The Altitude of the Aurora*, and *Physical Basis of Long Range Forecasting.*

Abbey, Edwin Austin, artist, was born in Philadelphia, Pa. in 1852, and began his art studies at the academy of the fine arts in Philadelphia. He stands in the foremost rank of painters of historical and subject pictures. His works are remarkable for the correctness of detail. He acquired great fame as an illustrator of Shakespeare, whose plays also supplied him with the subjects for some of his most successful pictures. Principal works: "Richard III. and Lady Anne," "King Lear's Daughters," "Hamlet," "Crusaders Sighting Jerusalem," "Fiammetta's Song," the decorative panels illustrating the "Quest of the Holy Grail," in the Boston public library, "Coronation of King Edward VII.," and "Columbus in the New World." He died in 1911.

Abbot, Ezra, American critic, was born at Jackson, Maine, in 1819. He was very precocious as a child, graduated at Bowdoin college, and settled at Cambridge, Mass., where he gained considerable reputation as a biblical critic. He contributed to periodicals, wrote several critical works, and also wrote in support of Unitarianism; his best known work is entitled *The Authorship of the Fourth Gospel.* Died, 1884.

Abbott, Jacob, author, was born at Hallowell, Maine, in 1803, and was graduated from Bowdoin college in 1820. He studied theology at Andover, Mass., was for several years a professor of mathematics in Amherst college, then taught a girls' school in Boston, and afterward was a Congregational minister in Roxbury, Mass. In 1838 he gave up his church there, and settled in Farmington, Maine, where he died in 1879. He wrote there most of his books, which number in all more than two hundred. Among them are the "Rollo Books," "Lucy Books," "Jonas Books," "Franconia Stories," "Harper's Story Books," "Marco Paul" series, "Gay Family" series, and "Juno Books."

Abbott, John Stevens Cabot, a younger brother of Jacob Abbott, and author of many historical works, was born in Brunswick, Maine, in 1805, and was graduated from Bowdoin college in 1825. He studied at Andover, became a Congregational minister, and was settled at different times at Worcester, Roxbury, and Nantucket, Mass., and New Haven, Conn. He died in New Haven in 1877. Among his works are: *History of Napoleon Bonaparte; Napoleon at St. Helena; History of Napoleon III.; History of the Civil War in America*, and *History of Frederick the Great.*

Abbott, Lyman, clergyman, author, editor, was born in Roxbury, Mass., in 1835; graduated from the university of New York in 1853; studied and practiced law; ordained Congregational minister in 1860; pastor at Terre Haute, Ind., 1860–65; New England church, New York, 1865–69; resigned pastorate in 1869 to devote himself to literature. Edited "Literary Record" of *Harper's Magazine;* associate editor *The Christian Union* with Henry Ward Beecher, whom he succeeded as pastor of Plymouth church, Brooklyn, in 1888; resigned in 1899. Editor of *The Outlook.* Author: *Jesus of Nazareth; Old Testament Shadows of New Testament Truth; A Layman's Story; How to Study the Bible; Illustrated Commentary on the New Testament; Dictionary of Religious Knowledge* (with late T. J. Conant); *A Study in Human Nature; In Aid of Faith; Life of Christ; Evolution of Christianity; The Theology of An Evolutionist; Christianity and Social Problems; Life and Letters of Paul; The Life that Really Is; Problems of Life; Life and Literature of the Ancient Hebrews; The Rights of Man; Henry Ward Beecher; The Other Room; The Great Companion; Christian Ministry; Personality of God*, and *Industrial Problems.*

Abd-ul-Hamid II. (*ăb-dŏŏl-hȧ-mēd'*), deposed sultan of Turkey, was born in 1842, the second son of Sultan Abd-ul-Medjid. He was proclaimed sultan in succession to his brother, Murad V., who was deposed in consequence of his mental incapacity in 1876, and died in 1904. Abd-ul-Hamid was forced to abdicate the throne in May, 1909, by the progressive party of Turkey, on account of maladministration and oppression. Under his rule the Ottoman empire was dismembered of some of its fairest regions. The Berlin treaty, concluded after the disastrous war with Russia in 1878, practically deprived the sultan of Bulgaria, Bosnia, and Herzegovina in Europe, and of Ardahan, Kars, and Batoum in Asia.

Abel (*ä'bel*), **Niels Henrik,** noted Norwegian mathematician, was born at Findö, Norway, in 1802, and died near Arendal in 1829. His work on elliptic functions is particularly celebrated. His complete mathematical works were published in 1839.

Abélard (*ăb'-ĕ-lärd*), **Peter,** scholastic philosopher and theologian, the boldest thinker of the twelfth century, was born at Pallet, near Nantes, France, in 1079, and died in the abbey of St. Marcel in 1142. The doctrines advanced by Abélard in his controversy with St. Bernard have a decidedly rationalistic tendency; and he and his predecessor, Erigena, may be looked upon as the first avowed representatives of that school. He laid down the principle that nothing is to be believed but what has been first understood, while the church held that we must believe in order to understand, and Bernard was for banishing inquiry altogether from the province of religion. Until recently it was chiefly the history of Abélard's romantic love for Héloïse which engaged attention.

Abercrombie (*ăb'-ĕr-krŭm-bĭ*), **James,** British general, was born in Scotland in 1706. He was commander-in-chief of the British forces in America in 1758. In the summer of that year he crossed Lake George with 15,000 men, and on July 8th tried to take Fort Ticonderoga by storm, but was defeated with the loss of 2,000 men. Sir Jeffrey Amherst then received command of the army, and General Abercrombie went back to England, where he became a member of parliament and deputy governor of Stirling castle. He died in 1781.

Abercrombie, John, born in Aberdeen in 1780, took his M. D. degree in Edinburgh, 1803, and established a practice there. After Dr. Gregory's death in 1821 he was recognized as the first consulting physician in Scotland. He is best known by his works on *The Intellectual Powers,* and *The Moral Feelings.* He died suddenly in 1844.

Abercromby, Sir Ralph, British general, born in Scotland in 1734. He served with much ability in Holland and in the West Indies, and in 1800 was chosen to command the forces to be sent against the French in Egypt. On March 8, 1801, he landed his army at Aboukir bay, near Alexandria, though strongly opposed by the French, and on the 21st fought the battle of Alexandria in which he was victorious. He was struck by a musket ball in the thigh early in the action, but remained on the field giving his orders until the battle was over. He was then carried off in a hammock, cheered by the soldiers as he passed, and taken on board a ship in the bay, where he died, 1801.

Abernethy (*ăb'-ĕr-nē-thĭ*), **John,** eminent British surgeon, was born in London in 1764, and died in 1831. In 1787 he was elected assistant-surgeon to St. Bartholomew's, London, an office which he filled for twenty-eight years, at the end of which time he was appointed surgeon. He was famous as an investigator and lecturer and has left many valuable works. One popular book is *Surgical Observations,* which became known among his patients as "My Book," from his frequent reference to it. He was brusque to the degree of rudeness but his wit and shrewdness made him popular. A rich, gouty patient once asked him for a remedy. "Live on sixpence a day and earn it," he answered.

About (*ȧ'-bo͞o'*), **Edmond François Valentin,** French novelist and miscellaneous writer, born in 1828, died in 1885. He was educated at the Lycée Charlemagne and the École Normale, Paris; was sent at government expense to the French school at Athens; on his return to Paris, devoted himself to literature. Principal novels: *Tolla, Le Roi des Montagnes, Germaine, Madelon, Le Fellah, La Vieille Roche, L'Infame, Les Mariages de Paris, Le Roman d'un Brave Homme;* miscellaneous works: *La Grèce Contemporaine, La Question Romaine, La Prusse en* 1860, and *Rome Contemporaine.* He was latterly elected a member of the academy.

Abraham, the progenitor of the Israelitish nation, was a native of Chaldea, but migrated with his wife, Sarah, and his nephew, Lot, to Canaan, where he lived a nomadic life and worshiped the one God, Jehovah, in the midst of the polytheistic Canaanites. The details of the narrative as given in the book of *Genesis* are familiar to everyone. He died at the age of 175, about 1800 B. C. Of his two sons, Isaac was the ancestor of the Israelites; the Arabs claim to be descended from Ishmael, whose mother was Hagar, a bondwoman.

Abruzzi (*ȧ-bro͞ot'-sē*), **Luigi Amadeo, Duke of the,** prince of royal house of Italy, was born at Madrid, Spain, in 1873; scientist, explorer, aeronaut, sportsman, litterateur; traveled round world as a youth; ascended Mount St. Elias, Alaska, 1896; his Arctic expedition of 1899 penetrated nearest to north pole up to that time; in 1906 he ascended the topmost height in the Ruwenzori range, East Africa, for which he was eulogized by King Edward. In 1909 he ascended some of the highest peaks of the Himalayas.

Acton, Lord. See **Dalberg-Acton.**

Adams, Brooks, author, was born at Quincy, Mass., in 1848, son of the late Charles Francis Adams; educated at a variety of schools, at home, in Washington, and abroad, following his father's changes of residence; graduated at Harvard in 1870; studied in Harvard law school one year; went as secretary to his father to Geneva, where the latter was arbitrator upon the Alabama claims under the treaty of Washington. Admitted to the bar, 1873; practiced law at Boston until 1881. Later resumed law practice; lecturer at Boston university school of law, 1904-11; member of Massachusetts historical society. Author: *The Emancipation of Massachusetts; The Law of Civilization and Decay; America's Economic Supremacy; The New Empire; Centralization and the Law.*
